In our own behalf, it may be said, that it is hard to understand how anybody who has read the RURAL NEW-YORKER for any considerable length of time can fairly arrive at the conclusion that it would suffer personal likes or dislikes of any kind to influence its advice or direct its statements.

In order to place before our readers the earliest information regarding the value of novelties every year offered to the public, we endeavor to procure the seeds or plants as soon as we learn of their existence. If they behave well the first year, our report is necessarily favorable. If the next year they behave badly, our report is necessarily unfavorable. If this is what Mr. Caywood means by "unsteady" or "vacillating," he is quite right. The Marlboro is a case in point. It pleased us the first year; it has disappointed us since. Now that the Minnewaski is offered for sale we shall obtain plants and test them beside the many other kinds of blackberries that thrive in the Rural Grounds; and we shall hope that it will be found as Mr. Caywood predicts, worthy "of living to defend itself long after he and the RURAL are gone."

BREVITIES.

PRES. INGERSOLL informs us that the tobacco raised on the farm of the Colorado State College, by Prof. Cassidy, has been examined by experts, and at least two of the varieties show that they are A 1.

AMONG sorghums the "Kaffir Corn" is promising. The seed will ripen as far north as Canada, and the plant yields a large amount of leaves and stalks that farm animals are fond of. The grain makes a fair article of flour. What we need is machinery that will clean the seeds and leave the kernel alone—the same as thrashing gives us the kernel of wheat or rye.

THE land is as dry as a chip, and when plowed is broken into dust or brick-like lumps. We are suffering from the severest fall drought within the memory of our farmers. It is Oct. 19. We found one of our neighbors this morning sprinkling, through the rose of a watering-pot, a lot of "ammoniated superphosphate," intending to sow it on a field that he was about to sow to rye and Timothy, and proffered the advice not to do it, but wait until Spring rather, or even sow it upon the late snows of Winter or early Spring. Were we right?

MR. J. S. COLLINS, of Moorestown, N. J., has some fine specimens of the Japan Chestnut. At this time (Oct. 15.) the foliage is still green and very handsome. One specimen five years old has fruited finely; it is, perhaps, 20 feet high and is finely proportioned. He has also some young trees—the Japan grafted and budded upon the native stock. The grafted seem to do about as well as the budded. With Mr. Collins the Comet-Lawson Pear, grafted upon Kieffer stock, has made a remarkable growth during the past season.

AND our pansies are the last flowers that bloom out-of-doors—they were the first. Upon the dining table and in the parlor we have pansies with a spray or so of wild fern, and they are as bright and jolly as ever. Pansies in Spring, Summer and Fall—all the while. Few flowers can talk with you, joke with you, wink at you as can pansies. And then there are serious pansies that will keep you company when you are sad. The rose is the queen of flowers, surely; but the pansy is the flower that the queen would choose, could she speak.

THE wife of a prominent fruit grower says that she has noticed that people learn to like the Kieffer Pear. Attracted by its beauty, even though it be to the amateur but skin-deep, people continue to taste and eat, until finally they learn to like it very much in the same way as a taste for tomatoes, bananas and other similar fruits is acquired. Specimens from the same orchard, or from the same tree, differ greatly in flavor. In the Philadelphia market the wholesale condemnation of the fruit, due to its deceptive appearance, has given way to a moderate appreciation, and it brings readily from $1 to $1.50 per basket.

AFTER watching several sick horses of late we are convinced that many farmers are unable to distinguish between a colic and a kidney trouble. Whenever a horse shows signs of pain, moves uneasily about, lies down and strikes with his feet, the unskilled owner at once decides that it is colic and doses accordingly. The treatment does very little good, in some cases simply because the trouble is in the urinary system rather than in the stomach or bowels. When the horse straddles, looks around at his flanks, lies down and gets up, makes evident attempts to urinate, and shows tenderness at the back, the dose for colic will do him little good. In mild cases, sweet spirits of niter with hot applications at the back will relieve him. As was stated by a correspondent in a late RURAL, a foul sheath causes much trouble of this character.

PICKLE raising is becoming an important industry on the north side of Long Island. At Greenlawn it is estimated that nearly 25 millions of pickles will be put up during the season. The crop is largely in excess of last year, when only about 10 millions were gathered. The crop varies largely from year to year, a good average crop being from 50 to 70 thousand per acre. The average price is about $1 per thousand. This usually leaves but a small margin of profit for the raiser. Horse manure is used chiefly as a fertilizer. Some of the commercial fertilizers are coming into use and will doubtless take the place of the more bulky manures which are now brought from the city. No special method of cultivation is practiced. The seeds are planted in hills and cultivated in the usual way. One of our neighbors tried an acre this year, but not with great success. We are too far from a pickle factory, and there are more profitable vegetables that we can raise for the markets.

Indust'l Societies.

AMERICAN HORTICULTURAL SOCIETY AT CLEVELAND.

(RURAL SPECIAL REPORT CONTINUED.)

Comparative growth of trees; best selection; profit not sentiment in tree culture; fruit growing in the Northwest; experience in grape culture; the Delaware; care in grape-culture; more grapes desirable; grapes trained on walls and fences; tender grapes for the north side of buildings (?); salt and lime for fruits; award of premiums; great increase of fruit culture in the South; the Mississippi Agricultural College.

An address on "The Comparative Growth of Trees," by Prof. Lazenby, of the Ohio Experiment Station, was delivered by him at the opening of the last afternoon business session of the society. He said: "I regard the American Ash as one of our most productive forest trees for planting for profit. Locust and catalpa grow rapidly, and with profit. Locust is best for posts. The ash grows with great regularity, and stands crowding better than anything I have tried. Woodland never should be pastured. Worthless trees should be cut out in the Winter, and seeds of valuable kinds be planted in proper places. The Chestnut will not succeed on Ohio bottom lands: the trees are dwarfed. I would urge timber culture because it pays: not because it would influence the climate very much. Let us cultivate timber for the money there is in it, and if it improves the climate so much the better." Mr. Ward: "I have grown maples two feet high in six months from the seed. Plant seeds of trees where nature plants them, and they never fail." Mr. Cushman: "Why not memorialize State Legislatures to devise some plan to stop forest fires and preserve woodlands. Exemption from taxation of forest land might be tried." Prof. Lazenby: "I don't believe in sentiment in this matter, allowing all trees to grow, good, bad and indifferent. Let us plant those that pay, because they pay. I believe in the utility side of this question." Several members spoke on the subject. President Earle said: "The National Government can plant forests if it will, and I don't know why the time to do it has not already come. The influence of such additional woodland area is greatly needed in the production of crops in general."

Secretary Hilman, of the Minnesota Horticultural Society, then read a paper on "Fruit-Growing in the Northwest," by J. S. Harris, of that State. He said, "The Northwest is an empire in dimensions. The Winters of 1872 and 1873 nearly destroyed all tender trees in our orchards; remarkable success followed for ten or twelve years, then a drought and a severe Winter in 1883 destroyed many more trees. This experience led us to plant the hardy varieties from Russia and Siberia, and now our future looks hopeful." Mr. Ohmer spoke of the success of his son in fruit culture in Marshall County, Minn., where the mercury falls to 45° and 50° below zero in Winter. He raises Turner, Reliance, and Gregg Raspberries without winter protection, thoug Gregg kills to the snow line. He also gr good grapes.

"The Advantage of Better Culture of Grape-vines," was the subject of Geo . Campbell's paper then read by the veteran grape man. Said he, in part: "During my 40 years' experience in grape-growing, I have discovered that grapes produce in proportion to the care and intelligence given the vine. The best culture will give the best results. Those who will not care for the vines must be content with the hardier or inferior kinds. Man was placed in a garden by God, who ordered him to dress and keep it. Thirty years ago I planted a Delaware vine, and after great care for three years I had nine canes. Of the 300 clusters that set on these canes, 200 were promptly cut off, only four new canes being permitted to grow. I had 100 bunches of as fine Delawares as I ever saw. Without this care I would have had 300 clusters of small, inferior grapes, and an exhausted vine. The Delaware is a good grape: never saw it rot. I advise winter protection for all vines. In mild Winters they are improved, and in severe ones they are saved by it. I have long been convinced that winter protection is often the turning point between the brightest success and a complete failure. Nothing pays better. Injury from cold leaves the vine more susceptible to mildew and disease. In a general way, I advise growing the best kinds. These with the additional care can be readily grown, and they bring good prices, while others are a drug in the market.

Mr. Green said "All have room for a grape-vine. No man with a house is without room for a grape-vine. There is no cheaper food for farmers, or their help, than grapes." Mr. Ohmer: "Grapes should be grown by everybody (Applause). I find great advantage in winter covering. I have 17 varieties, and lay them all down in Winter." Mr. Campbell: "Grapes upon walls often escape the effects of cold and disease when others do not." Mr. Ford also believed in wall training and winter protection. "I grow grapes on three sides of every building I have. I never saw rot or mildew on vines near a building. I intend to plant along a high board fence and build a shed to extend partly over the vines." Mr. Vandemann said: "The north side of a building is the place to put any tender thing; it will succeed there when it will not on the south side, where the evaporating influences are greater. In nature we find that all tender plants grow on the northern hill slopes, none on the southern slopes." Several members spoke of the advantages in training grapes on walls and buildings, also on trees. Mr. Pierce: "Grapes will not grow in Ohio on the north side of houses."

Then members began pitching into the U. S. Pomologist from all sides, regarding his new theory, and he appeared a little uncomfortable as he arose and said: "I don't wish to be misunderstood. Winter-killing is the effect of evaporation; this is less on the north side. The changes on the north side are less frequent and extreme than on any other."

Mr. Miller, "We surround all our fields with fences on which grapes are trained; they look pleasant and do well." Dr. McKay, "We plant our figs on the south side of houses and get good crops. Where the trees are exposed to the north winds we get no fruit. Strawberries on south and south-east slopes are earlier and more productive. I would give $25 or more per acre for strawberry land on southern slopes, rather than to have northern lands given me without price." Secretary Campbell, "I would plant on the east, west, and south, but not on the north slopes." Mr. Ward, "I am fully satisfied that vines growing around dwellings get something which suits them, and that is salt. When I want to keep a bouquet I put salt in the water and the flowers keep fresh in the cellar for two weeks. I have great success with the English gooseberries by using salt about the bushes, which is much needed here so far from the sea." Mr. Tryon, Ohio, "I have much faith in salt for many fruits; have salted bearing trees for seven years past with good success. Every tree in my grounds gets salt and lime, one part salt to three of lime, also the vines and gooseberries. I never have any mildew; gooseberries grow two by one-and-a-half inches. Think of that!"

At this point the award of premiums on plants and flowers was reported. Mrs. Ella Grant Campbell got the $50 White sewing machine for best floral design and also the first premium for the best collection of cut flowers. Edwin Geering, of Cleveland, won the $25 special premium for the best plant collection.

The last evening session began with an address by Professor McKay, of the Mississippi Agricultural College, on "Horticulture in the South." He said, "Cotton was king there until recent years. Ten years ago two acres would cover all the strawberry fields in Mississippi. Now we find that almost all fruits grown at the North will do well in our State. Our college farm has nearly 2,000 acres of land, a fine herd of blooded stock, and the best system of education outside of the languages. We hold it requires as much education to become a good farmer, as it does to make a successful member of the learned professions. Our capacity is 350, and this year we shall have three times that number of applications. Ladies are admitted. All are obliged to work a portion of each day for which eight cents per hour are allowed and deducted from the board bill. Many paid all their expenses last year in this way. Our orchards are yet young, but very promising. I find less co-operation and associated effort among the farmers of the United States than in any other profession." H. H.

Floricultural.

CALADIUMS INDOORS AND OUT.

This family offers us some of the most attractive foliage plants we possess; that they are not more commonly grown by amateurs is doubtless due to the mistaken idea that they are of difficult culture. Most growers are under the impression that the more ornamental variegated sorts are too tender for outdoor use; but this is an erroneous idea. These plants, like the calla, are deciduous, requiring a season of rest when the leaves die down. The root is tuberous. In March or April they should be potted in a mixture of loam, leaf mold, well-rotted manure and silver sand. Give plenty of drainage, as they require to be well watered, though the soil must not get sour. They may then be started with a fair amount of bottom heat, but this is not necessary after a few leaves have formed, and in this country they do well in an ordinary greenhouse during the warm weather. In the Autumn, when the beauty of the foliage begins to fade, the quantity of water given should be gradually diminished until it is entirely withheld. By this time the leaves will all be dead and the tubers at rest, when they are ready to be put away until Spring. The common usage is to lay the pots aside under the benches, until time for repotting, without any water. This is a mistake; the pots should be watered enough to keep the soil moist, from time to time, otherwise the tubers will be completely consumed with dry rot by Spring. The large, green variety—C. esculentum—is common enough in the subtropical garden where it forms a handsome decoration the Summer through. The root of this is eaten by the South Sea Islanders, under the name of taro; it tastes like a poor and watery potato.

The handsome variegated sorts do fully as well as the preceding out of doors, a fact recognized by few growers. They do admirably in shady spots, where ordinary bedding stuff is a failure. They need daily watering through the Summer, to be gradually decreased as the season wanes, just as if they were indoors. Then, when frost comes, they may be taken up, with a ball of earth, and laid away under similar circumstances to those grown indoors.

C. Meyerbeer, see Fig. 407, is a very ornamental variety, as the illustration shows. The ground color is white, veined with bright green, the mid-rib red. C. Verschaffeltii is dark green, irregularly blotched with red. C. Argyrites is the smallest and most elegant of the species. It has pointed, light-green leaves, irregularly blotched with white. In addition to the original species, we have innumerable hybrids, many of great beauty. They certainly deserve much more attention than is generally given them, and should find a place in every subtropical garden, since moderate shade and abundant water are their only requirements.

Various.

LAW.

Here are some recent decisions of the courts on questions of special interest to farmers:

Homestead Exemption: A dwelling-house may be claimed as an exempt homestead even though built on leased ground and a mere chattel, according to the decision of the Texas Supreme Court in the case of Cullers vs. James. The Court said: "It is contended that the homestead, under the Constitution, cannot embrace personal property. The exemption is, in terms, of lots or acres of land, but the object was to secure the family a home. 'House is not necessarily embraced in the word 'homestead.' . . . If the head of a family owns a house, and no interest or estate in the land on which it stands, the house is a chattel. If he occupies it with his family it is their home. He may be compelled to move it from one lot to another as fast as legal process can oust him."

Municipal Corporation Liability: In the case of the Town of Rushville vs. Adams, the Supreme Court of Indiana held that cities and towns were liable in damages for injuries resulting from the fright of horses of ordinary gentleness at the sight of objects on the street, although such objects were placed and maintained on the street through a license from the city. Streets having objects on them calculated to frighten horses of ordinary gentleness could not, according to the court, be said to be in a reasonably safe condition.

The Rights of Bicycle Riders.—An interesting suit, involving the rights of bicycle riders on the road, was tried at Moorestown, N. J., the other day. The plaintiff, D. Maurice Haines, sued James Moore to recover $100 damages for negligence on the part of the latter for not dismounting from his wheel and endeavoring to avert an accident which occurred on the Camden turnpike several weeks ago, in which Haines' wagon was broken by his team taking fright at Moore's bicycle. The jury rendered a verdict for plaintiff in the sum of $90 and costs, and the defendant at once gave notice of an appeal. The League of American Wheelmen is interested in the suit, and is confident of securing a reversal of this decision upon a rehearing of the case.

Iowa Railroad Law.—The Attorney-General and District Attorney Wilkinson, of Des Moines, Ia., have been directed by the Governor to begin suit against the following railroads: Chicago, Milwaukee and St. Paul. Illinois Central, Chicago and Northwestern, and Chicago, Burlington and Quincy—the suit being to compel these roads to comply with chapter 76, act of the Twenty-first General Assembly, the Sweeney Railroad Law. The Governor states in his letter to the attorneys that he understands that the railroads named refused to comply with the law, on the claim that the act violates a constitutional provision, and he therefore directs suit to be brought at once in the United States Court. The law requires all non-resident corporations to domicile in Iowa, the principal object being to prevent them from taking their litigation by venue to the Federal courts. It is presumed that the Governor thinks that by going to the Federal courts at once the ultimate decision will be obtained the sooner. It is probable that a bill will be introduced next session refusing the right of eminent domain to railroad companies that ignore the law, which would prevent extensions of their lines.

We do not recommend the nostrum for the cure of "fits" advertised by Professor R. H. Kline, M. D., of Philadelphia, and therefore we have declined to advertise it. There is absolutely no panacea for all cases of epilepsy, and as it is pretended that this is such a cure-all it must be a humbug. . . . . "The Magnetic and Voltaic Electric Female Health Regulator, for the use of women only," advertised from Marshall, Mich., is a sheer fraud. . . . . Here are some eye-opening experiences: The other day, George Swarts, aged 76, a wealthy live-stock dealer of Amity, Pa., while out driving with two strangers desiring to purchase live stock, was compelled by them

at the muzzle of a revolver to sign a $5,000 check on the Third National Bank, of Washington, Pa. Swartz was then thrown from the vehicle and had to walk home several miles away, while the confidence men drove in the opposite direction.

Abel Chase, one of the wealthiest citizens of Haverhill, Mass., aged 80, was the victim of a party of bunko steerers the other evening, who obtained a large amount of money on the pretext of desiring to purchase a valuable lot of real estate. He was induced to purchase tickets in a lottery, and lost $1,000.

A pair of knaves worked an old, old swindle on a simple citizen of Reading, Pa. One of them went into a cigar store carrying a violin, and, after buying a cigar, asked to be allowed to leave the instrument there for an hour or so. His request was granted. Pretty soon knave number two came in and bought a cigar, saw the violin, examined it, admired it, praised it, and wanted to buy it. The cigar man explained how it happened to be in his store. Then the stranger offered to give him $5 if he'd buy it when the owner came back, and authorized him to go as high as $50. Then he left and the first man came back, refused $20 for the violin, declined $35, and, finally, with great hesitation, accepted $50 for it, because he needed the money. Up to date the second man has not called for the fiddle, which is worth just $5.

What a commotion there would be among our patent medicine venders if our city police followed the example of the Berlin police, who are continually issuing warnings to the public, of which the following is a specimen: "The tradesman, Paul Heider, of this city, Anklamer Street 28, is selling under the name of 'Hurz Mountain Tea,' a mixture of lavender flowers, sassafras root, peppermint, and several other plants, weighing 50 grammes. His price is 50 pfennings, and he advertises it as a remedy. Official analysis has shown that the real value of one of these packages is hardly 10 pfennigs."

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

LOVE AND PHILOSOPHY.

'Twas at the Concord sages' school,
We met one summer's day;
I guessed—and used no logic rule—
I guessed what she would say.
"'Tis very warm"—this with a sigh—
"The sun that shines from thence,"
She said, and pointed to the sky,
"Is rolling toward the Whence."

I told her that it must be so,
At least it seemed so there;
For there was much I did not know
Of the Whatness of the Where.
About the only thing I knew,
When she was standing near,
Was that the sky was much more blue
In the Nowness of the Here.

She smiled, and said perhaps 'twas well,
Those pretty themes to touch;
And asked me if the rule I'd tell
Of the Smallness of the Much.
I told her that I did not know
That rule, but then I knew
A rule that just as well would go—
The Oneness of the Two.

She blushed and looked down on the ground,
And said: "It can't be so;"
And then the whole earth turned around,
For my heart was full of woe.
"Unto the Ceaseless of my End,"
I said, "I now shall go."
She murmured: "Don't you comprehend
The Yesness of my No?" —*Puck.*

OF INTEREST TO WOMEN.

Twisted wire rings are popular, two or three being twisted together and loosely knotted.

Tourmalines, opals and chrysoberyls are fashionable stones, both in rings and scarf-pins.

New tailor gowns of this season are made with a polonaise.

A sash of cashmere or serge, with wide fringe tied into its ends, is a popular finish for a school-girl's frock.

A pretty theatre bonnet, which may be made by any woman handy with her needle, is a little poke shape, with Normandy crown. It is covered with red crape in loose folds and bordered with cut jet beads. On the top, among puffs of crape, are some upright jet sprays.

Feather toques and bonnets in new designs are to be seen at the leading milliners. The toques are long and pointed, with dented crown, something like a deerstalker hat minus the brim. They are lovely in pheasant feathers and very showy in peacock. Bonnets are made entirely of similar feathers.

There are no very great novelties in lingerie. Collars are still plain and masculine, to suit tailor gowns; the only novelty is a very high, plain collar, buttoned close on the left side with two garnet studs. There are also some pretty fancy chemisettes of sheer muslin, plaited and laced down the center with narrow, feather-edged ribbon; the neck is finished with a dog collar of the muslin, with two rows of the ribbon run through it, and a bunch of loops at one side.

Dog-collars form a pretty and easily added finish to many costumes. Cardinal velvet, edged on both sides with jet beads, and a velvet bow at one side is very pretty. Or the collar may be entirely covered with beads, having a pendant bead fringe in front.

So far, the shapes shown in winter hats are precisely like those worn all Summer. They are still tremendously high, in spite of ridicule. However, they may change very materially before Christmas. Toques matching the gown are too convenient to be given up, but most of the imported shapes are very clumsy, trimmed much in front, so that they have a very top-heavy aspect.

SOME WINTER GOWNS.

"In the Fall a maiden's fancy lightly turns to thoughts of clothes," to paraphrase a famous quotation. This is the season when the woman of small means, who has no wish to look "dowdy," tries with much deliberation to decide whether she shall turn her last season's gown upside down or downside up. Perhaps a few hints from practical experience may be of service in the making of useful gowns for the coming season.

A correspondent asks how she shall make a woolen gown for house wear. This need not be a very difficult undertaking, though perhaps formidable to a busy housewife. The first requisite in woolen gowns now is perfect neatness of finish, to imitate the work of a tailor. The make should be simple; its stylishness depends largely on the draping. The rough cloths popular last Winter are now rather out of favor; smooth material is preferred.

A pretty gown is of navy blue tricot cloth. The gored skirt is quite plain, without any plaiting. At the foot are three rows of black silk braid, laid on flat. At the left side is a side plaited panel, extending from the waist to the foot of the skirt. It is 18 inches wide at the bottom, narrowing to about 6 inches at the top. The drapery is all neatly bound with the silk braid. The back drapery is made of one breadth of the stuff, which is 54 inches wide; it is perfectly square, and is bound with the braid around one end and side. The top is plaited across in large side plaits, and the unbound side is also plaited right up into the waistband, so as to leave the drapery hanging in one large point, with the fulness in heavy vertical folds, which hang very gracefully over the dress improver. There is a short apron front, coming from under the panel. The bodice is short, pointed in front, with postilion back, all neatly bound with the braid. It should be fastened with small flat black silk buttons. This is really a stylish gown, and has a very neat tailor finish. A little bonnet or toque may be covered with the cloth, and with cardinal feathers or ribbon bows will be very smart.

The drapery here described is really the prevailing mode; it is repeated over and over again, with but trifling variation. The short apron shape is certainly to be in high favor again. Its contemporary, the kilted skirt, is again coming into vogue, and we see some handsome cloth gowns made in this style. The skirt must be kilted all round in shallow side plaits; the drapery over it is just the same as that described for the blue cloth, minus the braid. The bodice is similar in shape, or may be varied by a vest.

Vests are very much worn, and are a great assistance when one is renovating an old gown. This is sometimes difficult, when one has not enough of the original material to produce a good result. Suppose the experimenter has a partly worn gown of myrtle green cloth. After making a rough estimate we would purchase about three yards of germinum red cloth—that is, supposing the wearer is young and brunette. The green bodice should be a cutaway shape, with vest and cuffs of red. The skirt may be kilted in broad plaits, alternately red and green; the drapery green. Or, if the supply of the original stuff was scant, the entire kilted skirt may be of the red. This would be a handsome gown, not at all "made-over" in appearance.

The home dressmaker should always design with an idea to future making over; with a little care and taste, even the busiest housekeeper need not fear the appellation of dowdy.

GRANDMOTHER ON FASHION'S FOLLIES.

"Well girls, I am glad to be at home again. There is no place in the wide world, that seems half as comfortable as my home; to be sure, there are lots of pleasant homes, furnished nicer than mine; but they are not as pleasant to me. My dear old chair! I would not change you for all the crimson brocaded furniture in Mrs. Elgin's parlor! No, indeed! I do not wonder that she has a weak back, or that the children are crooked, round shouldered, and feeble. I am sorry for the poor creatures, especially Bell. She has got a spinal trouble, the Doctor says. I should have two spinal troubles if I sat in such chairs as they use; hollow-backed, rolling seats, and stuffed. Even the baby has a stuffed chair with a crooked back. I told the folks that God made folks straight, that it was a terrible thing for a child to get his backbone twisted; and that I would not let a baby sit in one of their hollow-backed fixings. I did not care if they did look handsome and scrumptious; it is wicked to put a young one in them, and that a straight back basket-bottomed chair for a child was ten thousand times better, and more comfortable than those fiddle-de-dees they used. Mr. Elgin said he was not sure but I was right about it, but his wife wiggled around and said, 'Grandmother has such funny ideas! How an old fashioned chair like the one I had when a little girl, would look now-a-days.'"

"Well, Bessie Elgin, I think it would look a heap better than those weak, tottering children do." I spoke right out and gave them a piece of my mind. The idea of killing children for fashion's sake! And then, just to think how uncomfortable a child is who has the backache all the time. "Here," said I, "is Harry, who ought to run out of doors, and jump and holler, and have a good time, and come in to his dinner as hungry as a bear, with cheeks as red as a peony. Poor fellow! he looks like a potato sprout that grows in the cellar, he is so pale and spindling; he never laughs nor speaks so you can hear him half way across the room, and you keep him at his books, in a stuffed, easy chair, bent up like a hoop; you wonder what makes him so round shouldered. Goodness! Bessie Elgin, you did it yourself, and he will be a regularly grown hunch-back by the time he is eighteen, if you keep on managing him as you do now! He is a bright boy enough, but you make his brain grow faster than his body. Remember what I tell you: if he kly, deformed man you have yourself to thank for it. And there is poor Bell; she was a bright, healthy child, could laugh and sing, and was as merry as the day was long the Summer she came up to stay with me on the farm. Now look at her! she is as white as a snow-ball, her back is weak so she can hardly walk across the parlor, and her ankles are all twisted out of shape wearing your French heels, and she is an object of pity. I tell you, there is no use trying to improve on Nature's works. If God had meant to have girls have peeks on their heels He would have made them there and not left their feet unfinished. It is just misery and sin to put those high-heeled boots on a child; I can see no sense in it. They walk just like a goose: go waddling along, expecting every minute to tip over. Why, old as I am, I can go across the house as spry again as one of the children, because my feet are just as God made them. I am sorry for Elgin's people; they have got three sickly, whining children, and they have only themselves to thank for it. It is a pity, but if one will sacrifice their children on the altar of fashion they must bear the consequences. Yes, Mr. Elgin is rich; but, girls, let me tell you that riches, or fine furniture, or splendid dresses do not make people happy. No indeed! I have seen more sorrow and pain and suffering the last two months in Bessie's family than you ever endured in your whole life. You are happier in your old home, with your flowers and chickens and your health, than these children are in their stately mansion and costly surroundings. Yes, you have to work. Thank God that you are able to work! Work is a blessing, and things that you work and earn yourselves make you happier than if you laid in an easy chair and had them bought for you. I tell you, girls, you ought to be contented with your lot. Health and strength cannot be bought with money, and you have these in plenty. Happiness is not a boughten thing, either! and a person that is sick and in pain all the time cannot be happy. I hope I taught Bessie some things; anyway I told her some truths to think of now I am gone, and Mr. Elgin said he always knew I was a sensible woman; I told him I hoped I had common sense and was not too proud to use it."

Grandmother.

ENTERTAINING ANGELS UNAWARES.

I am asked to send the Rural anything that may prove of interest to women, and I therefore venture to offer a few hints in regard to the duties of a hostess. My observations are addressed only to ladies who for lack of means can afford but one servant, or possibly must combine the duties of a cook with those of hostess. Of course in this latter case some will say, do not invite a guest at all, but there are times when circumstances seem to render it almost necessary to do so, or indeed when one's own wish for the sight of a friendly face is so strong that a little extra labor would be welcomed for the sake of the companionship. Indeed there is no reason why a person of very limited means who has a very hospitable heart cannot entertain a guest comfortably if not luxuriously. In the case of receiving a guest whose style of living is superior to our own, there should not be the slightest embarrassment, for there is no shame in the fact that our circumstances do not allow us to cope with those of larger means. Never make apologies, they are in bad taste and can only make your friend feel ill at ease. Show that you are trying to make up for any deficiency in luxury, or it may be, in comfort even, by the heartiness of your welcome. Such remarks as, "I am sure my cooking cannot compete with that of your servants," and, "You must miss your handsome house, and find our little rooms very uncomfortable," can only embarrass your visitor.

I received my first lessons in easy grace in entertaining from a little lady at whose house I used to visit in New York. Never with more than one servant, often with none. She had a way of making her friends feel perfectly at ease, and heartily welcome, to such an extent, that one forgot everything else except the delight of her society. She took you right into her family, and you never felt that your coming had made the slightest difference. When household duties called her away, she left you quietly and easily without profuse apologies, as if she did you the compliment of thinking that you were capable of passing a couple of hours with yourself, and the papers and magazines that were at hand, without *ennui*.

Allow a guest to amuse him or herself and they will be happier than if too closely looked after. It is positively hard work to visit at a place where some one is always showing that they are making an immense effort to entertain you.

It is a good plan in small households, where a guest is expected, to have various matters connected with housekeeping in readiness. See that there is a sufficient supply of fresh table linen to last through the allotted visit; have the silver newly polished and extra plates and glasses at hand on or in the sideboard. Do not attempt to provide for a style of living greatly different to what you are accustomed to during your own everyday life. It can only result in discomfort to yourself and visitors. We are all familiar with the flushed face, and look of tortured suspense with which some hostess has watched the bringing in of various dishes, that she is uneasily reflecting have had to be left to the mercy of an ignorant servant. Her preoccupied manner, and painful attempt to appear interested in the conversation are only too apparent for the comfort of the guests.

Endeavor to repress all such signs of nervousness. Try at least to feel equal to the task of laughing off any mistakes of your untrained cook, since no one will take it to heart as much as yourself. I have heard it said that a hostess who cannot preserve her serenity upon even the most crucial occasions, is lacking in one of the most essential qualities of an entertainer. The thoughtless spilling of her best wine, the soiling of her choicest linen, may even the smashing of a whole tray-full of her old family china, should not cause one muscle of her countenance to change. Few are equal to this heroism, for heroism it is, but it can be acquired.

Selma Clare.

GOLDEN GRAINS.

From an old number of the Christian at Work, we clip the following rules for the husband:

Husband love your wife .....

1. Never find fault with her before others..

2. Per contra, remember the counsel of the Good Book: Her husband shall praise her in the gates; that is, before folks.....

3. Bear all her burdens for her; even then she'll bear more than you do, in spite of you.

4. If you want her to submit to your judgment, never ask her to submit to your selfishness .....

5. A woman's life is made up of little things. Make her life happy by little courtesies.....

6. Love is a wife's only wages. Don't scrimp in your pay.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

Has experience taught you among other things that you much prefer the censure to the praise of some people? This is a trifle contrary to the old saw that it is better to have the good than the ill will of a dog. Or do you consider that the ill will of a dog is of more moment than that of some people?

OCTOBER BREAKFASTS.

Boiled salt mackerel, stewed potatoes and muffins make one of the nicest breakfasts imaginable for a slightly cool morning. The mackerel must be large, fat and white, and soaked to the proper degree of freshness. One of the large kind, weighing from a pound and a quarter to a pound and a half, should be placed over-night in a large pan of cold water, and laid skin down. The next morning put it over the fire in cold water; let it come to a boil slowly, and simmer very gently for ten minutes. Drain off the water, lay on a hot dish and season with two tablespoonfuls of thick cream, made hot, bits of butter, pepper and minced parsley. Slice cold, boiled potatoes in thin, even rounds; season each layer as you drop them in a wide stewpan, with salt, pepper and bits of butter; cover with cold milk and let them stew slowly for fifteen minutes. Dissolve one teaspoonful of corn-starch in cold milk and stir it in just before removing from the fire. Excellent muffins are made from bread dough that has been mixed over-night. Mold small, flat pieces and lay them in a warm place for three-quarters of an hour; fry in a very little hot

fat on the top of the stove. They must be pulled apart and buttered at the table, but never cut with a knife.

Many people do not like freshly cooked meats, such as steaks and chops, for breakfast, preferring cold meats that can be made into nice dishes. Cold veal is particularly happy in its possibilities. Try this with mushrooms. Put a few small mushrooms, or some larger ones sliced, into a stewpan with a bit of butter and a tablespoonful of water, and let them stew in their own liquor. Meantime take two cupfuls of minced and nicely seasoned veal, put this into another saucepan in which you have first melted a tablespoonful of butter, and stirred in as much flour, add four tablespoonfuls of cream and the stewed mushrooms, stir all together, simmer for five minutes and pour over thin slices of nicely toasted bread.

Miroton of veal is a preparation that one would never think of insulting with the name of hash. Take some slices of cold veal and mince them with less than half the quantity of cold boiled ham, season with pepper, grated nutmeg and a small onion minced and fried in a little butter. Add also a French roll that has been soaked in a little milk, a gill of thick cream, and a little grated lemon peel. Put all these into a pan over the fire and stir until heated through, then stir in a well-beaten egg, press the mixture into a buttered pudding dish and set into the oven to brown. Turn out on a hot dish, pour over a good gravy made from the bones of the cold meat.

Minced beef makes a delightful breakfast dish if seasoned by an artist. Take a pint bowl full of very finely minced beef to which has been added two ounces of salt pork. Mince a good-sized onion and fry in butter, add the beef, a gill of good gravy and seasonings. Have ready lightly browned and buttered pieces of toast on a hot dish, spread the mince over them and place on the top a poached egg for each person.

Beef cakes are made from three parts of finely chopped cold beef and one part of mashed potatoes, a little minced parsley and a beaten egg. Make into cakes about half an inch thick and as big around as a teacup; dredge with flour and fry in hot drippings. Serve with a tomato sauce and brown gravy.

Mutton sausages may interest where cold boiled or roast has ceased to do so. Mix together one pound of cold mutton, three ounces of beef suet (these two must be very finely chopped), as great a bulk of bread crumbs, a pint of minced oysters, two anchovies also minced, a seasoning of thyme, marjoram, pepper and salt. Mix all these ingredients thoroughly, moisten them with the beaten whites and yelks of two eggs until they form a stiff paste; form into balls or sausages and fry. PALMETTO.

A PLEA FOR THE OPEN FIRE-PLACE.

It is too early for anthracite, too late for a fireless house, and happy is that home where the family can enjoy the comforts of an open fire through the chilly autumn days. Few things possess more elements of cheer than a blazing log on the fire dogs in October. The hearth has an especial charm at this season, and the gleam of the firelight mingles with the yellow glow that is over the landscape from trees and mellow sunshine. Maple wood is constant and steady; one does not care for a noisy, sputtering backlog that carries danger in its sparks; but the perfection of a wood fire is reached when one can burn the aromatic branches of an old apple tree. One lies before me now, giving out fitful gleams, faithful in its life, and giving us comfort and cheer even in its cremation. Then the ashes are of rare value, and the tree lives again in some other form. By and bye architects will understand the needs of a home and build fireplaces, not for show, nor to be filled with feathery stalks of "sparrowgrass," as was once the fashion in the country; but to form the missing link between the summer's heat and the winter furnace. I remember entering a dry goods store in Boston one wet morning and being beguiled into the ladies' parlor where a blazing back-log in an open fire-place and a comfortable easy-chair, invited to rest. It was the poetry of shopping. When builders learn that the open chimney is the best means of ventilation, they will not seek to shut up every nook and cranny, as is now too often the case. Housewives object to branches and the frequent need of renewal, but there is less dust and disorder than is made by a scuttleful of coal, if carefully managed. And what a care this house-warming is in homes where there are no furnaces. Even these are not without some drawback; for I have seen in our city houses, many children who lost health, and became subject to frequent colds that parents could not understand, which might be traced to the pernicious habit of standing over the register or hovering around it. Not only in their homes, but in school, this is carried to excess and should be forbidden. And when I say "forbidden" I mean rather "explained," for children are reasoning beings, and if told of the evil of any habit, will be likely to give heed to the warning, while if sternly forbidden without a reason they are likely to rebel without understanding. Am I getting prosy over my wood fire? At least my thoughts are not the result of vitiated air, for the doors and windows are open; the October breeze is coming in and gently moving the sheaf of golden rod and asters that the little ones have gathered while out-of-doors, and "the maple leaf is blushing red." ANNIE L. JACK.

CLOTHES RACK.

Fig. 408 is a sketch of a clothes rack we have in use and find very convenient, as it is always ready for use, and never in the way. It is hung in a corner behind a door that usually stands open, and is the same size as the door. It is made as follows of pine lumber:

Two strips 6½ feet long by 1x2 inches are morticed to receive the tenoned ends of the upper, lower and middle bars, made of the same material, and 2½ feet long. The other bars are made of lath dressed to one inch wide, and let into the standards even with the front surface, and fastened with screws or small nails. This is hinged to another strip 1x2

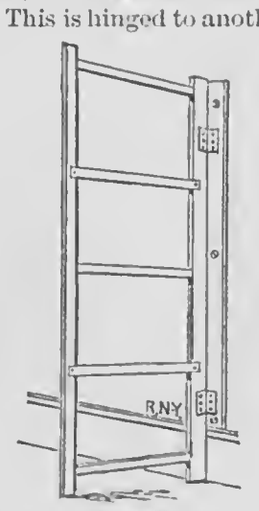

Fig. 408.

inches, which is fastened to the wall in the corner by two large screws. The outer upright bar should stand on the floor, the other one may be cut a little shorter. As the rack is light, the outer bar resting on the floor does not interfere with it swinging, but keeps it in place. When in use, it is swung out a foot or more from the wall; when not in use, it stands flat against the wall, and can then be used for small articles. The whole is planed, and painted the same as the room. Of course it is not essential that the rack should be behind a door; it may be put in any convenient place and made larger or smaller to suit the situation. F. S. NEWCOMB.

SUGGESTIONS.

Avoid waste in boiling potatoes by cooking only those of one size at a time.

From our own experience we believe that tea drinking makes women nervous and irritable.

If you are the happy possessor of a good umbrella it pays to take care of it. After it has been wet, keep it open until perfectly dry. If you would prevent cutting, don't strap tightly or keep it in its case.

Rancid butter or lard *cannot* be restored to its original sweetness. Better use it for soap than for food.

The "Queen" continues to be the leading style in watch chains for ladies' wear.

Don't stand up when you can do a piece of work sitting down.

Do not sacrifice your health and strength for economy's sake.

Keep your children in school. Nothing but sickness should keep them at home. It is unfair to both teacher and child to let every little unusual occurrence serve as a pretext for non-attendance.

REMOVING MOLD FROM CLOTHING.

Years ago I tried an experiment and was so well pleased with the result, that I have often tried it since, and been equally successful.

I found an article of white piqué badly molded; in fact, the mold stood on it in miniature trees. I concluded it was a vegetable growth and so tried *drying it out*. I dried it as thoroughly as possible, baking it in a cool oven for two or three hours; then I brushed it carefully with a stiff clothes brush, and when I was done there was no trace of mold, and when it was washed it looked as white and clear as ever. AUNT EM.

WHAT OTHERS SAY.

The U. S. Dairyman says that sweet and sour cream require different temperatures for churning, and that they cannot be churned together without loss.

The Household thinks it is refreshing now-a-days to meet a twelve-year-old girl who has not a "steady beau," and knows nothing about flirting.

Eliza Archard, in N. Y. World, tells women that fancy work is a genuine deadening drug, cheating them into a fool's paradise. While they delude themselves with thinking they are at work, they are absolutely doing nothing, or that which is worse than nothing.

The Monthly Magazine of Pharmacy says that the best preparation for the hands at night is the white of an egg with a grain of alum dissolved in it. Quacks have a fancy name for it, but anyone can make it. Slightly beat the egg, add the powdered alum, spread over the hands and draw on a pair of gloves.

DOMESTIC RECIPES.

ENTRÉE OF CHICKEN.

A very pretty and delicious entrée is prepared as follows: Take a good-sized young chicken; clean it well and free it from pinfeathers; with a small sharp knife cut off the entire breast; then place the carcass in a closely covered vessel with just enough water to cover it, and simmer slowly for half an hour. Lift it out and take off the legs, thighs and largest wing joints, which should be tender by this time. Stew the carcass for half an hour longer; take it out, pick the meat from the bones, throw aside the skin, and chop the dark meat very fine with plenty of parsley and a seasoning of salt and pepper. Mix a beaten egg with this and roll into little balls, which should be dipped in egg and bread crumbs. Make a sauce with the gravy in which the chicken was boiled, which should be reduced to a large cupful, half a can of tomatoes and a minced onion. Stew for half an hour and strain through a sieve and thicken with a little corn-starch. Meantime stew the breast which you have cut crosswise in pieces half an inch thick, until tender. Fry the legs, thighs and wing bones, and the little balls in some butter until delicately browned. Place the white meat in the center of the dish, the balls and pieces around, and pour the tomato sauce over all. MRS. A. G.

KEEPING EGGS.

I have kept eggs for winter use without any packing, but I was careful to keep them in a cool, not cold, place, and turned them twice a week. FARMER'S WIFE.

DOUGHNUTS.

Two eggs, one cup of sugar, one cup of fresh butter-milk, an even teaspoonful of soda, one teaspoonful of salt, one nutmeg and flour enough to make a soft dough. Roll to less than half an inch thick. Mold and fry in boiling lard. These will not absorb a bit of the fat, and are the least pernicious of the doughnut family.

AN IMPROVEMENT ON SALT-CURED MEAT.

Last year after our meat had taken the salt, and was ready to smoke, we made a hot soapsuds, and washed the meat, and dried it thoroughly, then took equal parts of ground red and black pepper, and with our hands smeared it over the meat very thick, then hung and smoked it, and this year our meat is delicious. The lean is a bright red, like fresh meat; the fat a clear white. Our neighbors say we have the best meat in the country. I also think I have learned something about lard. I suppose every one knows that a small quantity of sal soda added to the lard while rendering will make it white; but is it known that lye will answer every purpose if soda is not procurable? I kept my lard in a can on the smoke-house floor. I now find it slightly rusted on the bottom of the can. I think that if the can had been raised off from the floor, so that there would have been a free circulation of air around it, this would not have happened. MRS R. W. WILLIAMS.

(Will our correspondent kindly give us her proportions of sal soda or lye and lard.—Eds.)

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

Catarrh

Is frequently an indication of a Scrofulous taint in the system. Ayer's Sarsaparilla purifies the blood, and thus restores health to the affected membranes. It also stops the nauseous catarrhal discharges, and prevents the infection from reaching the lungs and stomach. Catarrh should be treated as a blood disease.

I suffered for years from chronic Catarrh. My appetite was very poor, and I felt miserably. None of the remedies I took afforded me any relief until I commenced using Ayer's Sarsaparilla, of which I have now taken five bottles. The catarrh has disappeared, and I am growing strong and stout; my appetite has returned, and my health is fully restored.—Susan L. W. Cook, 909 Albany st., Boston Highlands, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass

GOLD MEDAL, PARIS, 1878.

BAKER'S Breakfast Cocoa.

Warranted *absolutely pure Cocoa*, from which the excess of Oil has been removed. It has *three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup*. It is delicious, nourishing, strengthening, easily digested, and admirably adapted for invalids as well as for persons in health.

Sold by Grocers everywhere.

W. BAKER & CO., Dorchester, Mass.

"AN EXCELLENT JUDGE"

The late Gordon W. Burnham of New York, after his return from an extended tour through Europe, said: "I have bought and tried the finest Shaving Soaps made in England and on the Continent, but for months have been longing to be where I could again enjoy the Luxury of Shaving with the GENUINE YANKEE SOAP."

All Druggists keep it. Avoid Imitations. Trial Samples by Mail, for 12c.

News of the Week.

HOME NEWS.

SATURDAY, October 23, 1886.

Oakland, Ill., was almost entirely destroyed by fire last Tuesday—loss over $300,000 .. Whitelaw Reid is reported to have bought Henry Villard's palace here—price about $400,000.....Aggregate loss by that fire at Eastport, Me., about $800,000. While the town was in a blaze and the people were trying to save their effects a horde of Canadian fishermen from the neighboring Canadian islands invaded the place, and pillaged right and left, taking away furniture and all other movable property until frightened off by an American cruiser which arrived opportunely.....J. G. Blaine has been making rousing "protectionist" speeches in Pa.—hailed with tremendous Republican enthusiasm .....At Biloxi, Miss., 25 cases of yellow fever are reported. Too late to spread far this year.....Loss by fire at Salisbury, Md., now estimated at over $1,000,000.....Geronimo and Natchez and 13 of their principal followers, are to be kept in close confinement at Fort Pickens at the entrance of Pensacola Bay, Florida. The rest of the surrendered hostiles, consisting of 11 women, six children and two enlisted scouts, are to be kept with a lot of other Apache Indians at Fort Marion, near St. Augustine, Florida. Husbands and wives are thus separated.....The will of the late Samuel J. Tilden was admitted to probate at White Plains, N. Y., Wednesday. An attempt to break it is to be made by some of the heirs .....At Saco, Me., a family Wednesday drank cider which killed the son, while the father and mother were sickened. It came from a cask which had previously contained a poisonous embalming fluid, and had been purchased from an undertaker .. . After all, the Inman Line of steamships has been sold to Peter Wright & Sons of Philadelphia for $1,250,000. The Philadelphia firm is supposed to represent the Penn. R. R. .....The prohibitory law went fully into effect at Atlanta, Ga., last Tuesday. All liquor stores shut up; law to be rigidly enforced. City Council gave a local brewery permission to deliver beer at private residences; Mayor Hillen has vetoed the ordinance...In Canada the most important election since Confederation is probably that of the Province of Quebec, just over. The Liberals, or opposition, claim 35 out of 65 members, but there are so many contested elections that the result is a trifle doubtful. The English districts favor the present Government; the French are against it, 22 of the 40 French constituencies previously held by the Government having swung against it. Bad for the French to run on party issue, as their number increases slowly by immigration, whereas other races increase fast. According to census of 1881, the French in Canada number 1,208,929; English 881,301; Scotch one-half a million; Irish, nearly a million; Germans a quarter of a million.....Charleston is still getting lots of money, and wants more. Gov. Sheppard won't call an extra session of the Legislature to make a special loan for building purposes; and there isn't enough money in the place to re-build..... .....There's a great deal of sharp Congressional fighting all over the country, and it's a splendid time for farmers or any other independent voters to make their mark, because the uncertainties of the Congressional campaign are so great. The Democratic majority in the House is 43, and there are 44 districts in which the plurality of the present Congressmen was less than 900. Twenty-four of these districts are represented by Democrats; one each in California, Connecticut, Indiana, Kentucky, Louisiana, Massachusetts, New York, Pennsylvania, Tennessee, Virginia and West Virginia; two in Michigan; three each in Illinois and Iowa, and five in Ohio. Twenty districts went Republican by less than 900 plurality—one each in Connecticut, Illinois, Kentucky, Michigan, Nevada, New Jersey, Ohio, Tennessee and West Virginia; two each in California, Iowa, New York and Wisconsin, and three in Indiana. In most of these districts the plurality is much less than 900, in many less than 400, while the third party vote is often larger than the plurality, so that the call for sharp fighting is pretty evenly distributed over the country, and the result mighty uncertain till after election day. .... Much complaint in Mass. that the new law prohibiting the sale of tobacco to persons under 16 years old is openly violated—penalty a fine of $50 or under.... ...What a tremendous rush of dishonest rascals there has been from this country to Canada of late. Here they'd be pinched in prison; there they grow fat at hotels. The Dominion seems to have had enough of them—it has rascals enough of its own .....The Canadian cabinet Council has removed the extra $400 fine imposed on the schooner Marion Grimes and sent a letter of strong censure to Capt. Quigley of the schooner Terror for his action in hauling down the American flag. The Council was agreed that there was no precedent for such an act, and condemned it in unmeasured terms. .. .. Much complication about that Haddock murder case at Sioux City, Ia. Koskiniski, arrested in San Francisco, and Ganden, caught in the South, say they saw the shooting and were hired by the rumsellers for $100 each to pound the parson, while Leavitt and Arensdorf, already in jail, were looking on. Their courage failing, Arensdorf stepped out and began the altercation that ended in the shooting. But he was in front, and Haddock was shot in the back; who did the shooting?..... ....The stock-yard strike at Chicago collapsed Monday, the men offering to go to work at 10 hours a day instead of eight. Armour and the other packers won't discharge the hands they took on during the strike, but they are sure to go themselves to avoid "pounding" to death by the old hands. A lot of them together with about 100 Pinkerton men started on the cars from the packing houses Tuesday morning. The strikers and their sympathizers hooted and stoned them, and some of the Pinkerton men fired into the crowd, wounding several and killing a truck driver named Terry Begley. About 75 of the Pinkertons were arrested and a dozen of them are still in jail, and would be lynched by the populace if they were come-at-able. They say they didn't fire till they were attacked with stones and shot, Police Captain Markey says they fired first without sufficient provocation..... ....Mike McCool, the notorious pugilist died in the Charity Hospital at New Orleans, the other day—malarial fever complicated with diseases of the bladder which had reduced him to a mere skeleton.....A year ago, John B. Mannix, assignee of Archbishop Purcell of Cincinnati, who owed his people $4,000,000. when pressed for a settlement proved a defaulter, having speculated away $300,000 in the stock market. At a meeting of the creditors Sunday a letter was presented from ex-Governor Hoadly, one of the four bondsmen of the assignee, in which letter the ex-Governor proposed to pay the trustees of the Purcell estate his fourth of the amount of the Mannix bond—$62,500—and to transfer to them all his (Hoadly's) interest in the property which had come into his possession from Mannix. In doing this noble deed Gov. Hoadly wrecks his fortune and deprives his children of a heritage. By his action the assignees will receive $105,000, which will enable them to declare a dividend of 1½ per cent., the first sum the creditors have received since the failure. ....E. O. Graves, Chief of the Bureau of Engraving and Printing, denies most emphatically the stories of the flooding of Chicago with counterfeits of the new $10 silver certificates.....A National Convention of distillers, brewers, and wholesale and retail wine, spirit, and beer dealers numbering 400, in session at Chicago last Tuesday, effected a permanent organization under the name of "The National Protective Association." The platform opposes prohibition, favors license, and denounces disreputable places ....The Richmond Convention of the Knights of Labor has come to an end. It reëlected Terrence V. Powderly as General Master Workman by acclamation. J. L. Griffiths of Chicago was reëlected General Worthy Foreman by 490 votes, against about 125 for all others. Frederick G. Turner, of Philadelphia, the present Secretary and Treasurer, was reelected Treasurer; and Charles H. Lichman, of Marblehead, Mass., was elected Secretary. Powderley's salary was raised from $1,500 to $5,000 a year; and the salaries of the other chief officers were raised to $2,000 apiece..... .....Prohibition in Georgia has proven a wonderful stimulant to illicit distilling. The jail of Fulton County is filled with violators of the internal revenue laws, and eighty others are held in the inclosure on the same charge.....A fire which swept away one-half of Stockton, Utah, is believed to have been set by Mrs. Provost, who had threatened to burn the town unless the saloons stopped selling liquor to her husband.....Second Comptroller Maynard and Third Auditor Williams have just concluded a critical re examination of the accounts of the Signal Service from Sept. 1, 1880, to July 1, 1886. The expenditures aggregated $1,865,333; of this amount the accounting officers have disallowed and suspended items amounting to $1,801,669, as unauthorized by law, principally for telegraphing, the purchase of supplies, foreign service, etc John T. Jones, a tramp is reported to have lately made $5,000,000 in two months. He discovered that the refuse ore rock of the iron mines in the upper peninsula of Mich., contains 50 per cent. of good ore, yielding, when sorted, $5.50 per ton. He contracted for the heaps at 25 cents per ton, sold the ore, and now vast reduction works are being constructed, and a new industry which will give work to thousands is being started. ....The switchmen's strike at Minneapolis is still paralyzing railroad business there. The roads refuse to arbitrate or yield an inch.... The steamer Anchoria with all her crew and passengers, arrived safely at St. Johns, Newfoundland, having broken her screw shaft . ...Mr. Jacob Sharp, Mr. James W. Foshay, Mr. James A. Richmond and Mr. Thomas B. Kerr, the chief officers of the Broadway and Seventh Avenue street railroad of this city, were indicted and arrested for bribery Tuesday. They gave $50,000 bail each to appear for trial. Solomon Sayles, a wealthy butcher of this city, who gave $25,000 bail for his brother "boodle" Alderman Sayles, who fled to Canada, has paid into court $25,000 forfeited bail. .....The strike of the cigarmakers in Havana is ended. The operatives have been conceded all their demands by the manufacturers. .... The Prohibitionists are rather more active in Michigan than in most States. Until the campaign opened they were organized in but 18 of the 77 counties in the State, while now they have 50 county organizations, congressional candidates in every district but one, and 17 Prohibition papers pleading the cause. They publicly claim a vote of 25,000, a gain of 7,000 in two years, and privately they say that their State canvass indicates a vote of from 30,000 up. ... Jay Gould is reported to have tightened his grip on the transportation facilities of St. Louis, and to have killed the project for a rival to his bridge across the Mississippi..... .... Great preparations here for unveiling the great statue of "Liberty Enlightening the World" on Oct. 28; will be a general holiday; and delegations from all States and Territories are expected. From France, De Lesseps, of Panama Canal fame, and several representatives of the Government will take part in the ceremonies. So will Bartholdi, the sculptor of the marvel. Military organizations from all the neighboring States will add to the glory of the day. .....Earthquake shocks, well defined but comparatively slight, were felt in Georgia, South Carolina, North Carolina, Tennessee, Ohio and the District of Columbia yesterday morning. Charleston seems to have suffered the most. Buildings were somewhat damaged and there was considerable fear, but no people were hurt... .....

A Novel Treatment for Rheumatism.

IF you have ever had a touch of this disease you will appreciate what is said by the following correspondents in reference to the results of treatment by Compound Oxygen:

Mrs. Margaretta Bair, a Philadelphia lady living at 19th and Filbert Streets, says: "Nearly twenty years ago I was attacked by rheumatism. I suffered from it for years and was reduced almost to a skeleton. My condition led my physician to conclude that I could not live more than a few weeks. About this time, in 1881, a friend had been wonderfully helped by Compound Oxygen. With hardly a hope of success I began the treatment. I am no longer an invalid in any respect. *Rheumatism is gone long ago.*" This is only a specimen. Hundreds of letters of similar character are on file in the office of Drs. STARKEY & PALEN, 1529 Arch Street, Philadelphia; some of them are printed in full in a monograph on "Rheumatism," and others in a volume of nearly two hundred pages, both of which you may receive free by mail for the asking.—*Adv.*

FOREIGN NEWS.

SATURDAY, Oct. 23, 1886.

THE Bulgarian muddle is still the chief topic of European interest. Reports relating to it are so contradictory that there is little doubt that many of them are made for the purpose of influencing prices of stocks and agricultural produce. There seems to be an agreement among the Powers that the re-election of Prince Alexander of Battenberg, cannot be permitted, as he is politically and personally very distasteful to the Czar and Czarina. Turkey seems to have made an agreement with Russia, and urges the Bulgarians to postpone the meeting of the Great Sobranje for the election of a prince in order to allow Russia and the Porte to agree upon a ruler; but the Regency declares this cannot be done unless a specified time is announced within which the ruler must be chosen .....A vast majority of the newly elected deputies to the Sobranje insist on the necessity of electing a prince at the date appointed for the meeting of that body, Oct. 28. Germany and Austria however, according to this morning's cablegram, side with Russia in declaring the election illegal, on condition that Russia will not occupy the country. Russia lacks the "sinews of war" and may therefore moderate her claims; though it is seldom war is prevented by scarcity of money. Reliable reports describe the condition of Southern Russia as deplorable. Discontent is universal. The Nihilist propaganda is in a more active and flourishing state than ever before. The prisons, especially those at Nicolaieff, Odessa and Ekaterinoslav are filled to overflowing, and the proportion of officers and students comprising those who are confined in the prisons and those who are under police surveillance is a source of alarm to the authorities. This year's harvest in Southern Russia has been unusually abundant, but the high German duties absorb the profits, and the value is therefore diminishing year by year. Landowners are selling out at a ruinous sacrifice, and Moscow merchants declare that commerce is at a complete standstill. The scarcity, and in many places the entire absence of banking institutions of any kind combine to complicate matters, and the near future promises no improvement.... ....In the United Kingdom there's something of a lull in political excitement. At the adjournment of Parliament it seemed likely that it would reassemble in November to legislate on Irish matters; but lately affairs in Ireland have been quieter than for years. A great number of eviction notices have been served on tenants who are backward with their rent; but there is a strong disposition among landlords to make considerable reductions where investigation leaves no doubt that the tenants can't pay up in full. Where the reductions are satisfactory, the rent is paid; where they are not large enough no rent is offered. A considerable number of agrarian outrages are perpetrated, especially by "moonlighters"—disguised men who prowl about collecting arms, maiming cattle of obnoxious farmers and committing other deviltries—but the National League appears to be opposed to these doings and the priests and Catholic bishops certainly are, and their number is less than was expected..... ...

In England unusually great distress prevails among the wage-earning classes. Business is very dull; wages are low, and hundreds of thousands are compulsorily idle. The work-houses are uncommonly full, and while in Ireland "wards of honor" are set apart for those who go to the poor houses on account of the land troubles, for English work people there is no way of lessening the humiliation. Among the general distress the Socialists, who preach a more equal distribution of property, are making thousands of converts. At the Lord Mayor's Show in London next week, at which much antiquated mummeries usually excite laughter, jeers and curiosity, there is likely to be trouble, as the "labor reformers," or Socialists, threaten to follow the show from 80,000 to 150,000 strong to emphasize their strength and distress. The police authorities cannot manage such an assemblage, and are trying to induce the leaders to forego the display..... . ...Last Saturday and Sunday the United Kingdom was visited by a hurricane fully as bad as that which swept over the Gulf of Mexico and some of the Northern States about the same time. Considerable destruction of life, and great destruction of property ....In France, apart from war preparations, which always hold first place in public attention, the chief topic of interest just now is the withdrawal of English troops from Egypt. There was an international agreement that they should be withdrawn; but no specified date for doing so was mentioned. France says England keeps them there with the hope that the trouble in Europe may enable her to occupy the country permanently. Frenchmen are as deeply interested as Englishmen in the enormous Egyptian debt, and the permanent occupation of the country by England would give her command of the Suez Canal, the route to the French Eastern colonies, and make her mistress of the Mediterranean. Hence France with the aid of Turkey and Russia seeks to coerce England to withdraw..... France is squandering money in Touquin, having just appropriated 30,000,000 francs for use in that grave of so many French soldiers. Her trouble with the people of Madagascar is not yet over, as the latter are very dilatory in complying with the terms on which peace was concluded, which gave French trade an advantage over that of all other countries. English intrigue is bitterly opposing such concessions..... .....Germany still dominates Europe. If war is avoided in the Bulgarian embroglio it will be because Bismarck objects to it; and his objection is due solely to the great age of the Emperor, who does not want the last years or months of his reign to be disturbed by war. Moreover, his friendship for the late Czar has descended to his son, and in case of war Germany and Russia would most likely be on opposite sides. Hence Bismarck is coercing Austria to take a less hostile attitude, and urging Russia to moderate her demands. It was doubtless by his advice that General Ghourko, one of the heroes of the Turko-Russian war, when Russia "created" Bulgaria, is to replace the truculent Kaulbars as Russian agent in that country. Reports are very conflicting as to the health of the old Emperor.....

AGRICULTURAL NEWS.

SATURDAY, Oct. 23, 1886.

THE Territory of Montana will send to the Eastern markets this year not less than 250,000 head of cattle and perhaps the number may reach 275,000. From 75 to 100 car loads of these are being shipped daily to Denver, Chicago and other cities to the east of the Territory, and that rate of shipment is to be maintained until the close of the year. The cattle are shipped on the Northern Pacific Road on trains made up for that particular purpose and moved at the rate of 25 miles per hour.....Sumac gathering is becoming a recognized industry in portions of Virginia. This year the quantity gathered is unusually large, some gatherers having made $500 each by collecting the leaves and branches of the shrub, which they call "shomeake."....

Prominent grape growers of Hammondsport, N. Y., estimate that 500 tons of grapes were frozen on the vines on the shores of Lake Keuka Saturday night, when the mercury went down to 20 degrees above zero .... .. Here is what somebody thought worth while cabling yesterday. Two Short-horn bulls, a cow and a heifer have been purchased from the Queen's farm at Windsor, and have left for the United States, where they are to be used for breeding purposes. Lots of Short-horn herds in England might better than the Queen's——a colored gentleman somewhere in the wood pile.....The shipments of live stock and dressed meats per steamships from the port of Boston for the English markets last week, were 1,101 cattle, 64 sheep and 4,024 quarters of beef.... ...The Governor of Western Australia has issued a proclamation prohibiting the importation into that colony of all cattle, sheep and swine from Great Britain or Ireland, or from any other place beyond the limits of the Australian colonies .....A vessel from Montreal, loaded with 500 cattle sailed last week with a lot of oil aboard, to test the claim that oil poured on the ocean when rough will give smooth water in which to move. The captain has tried it before, with alleged success. At this season rough weather is anticipated ..... A company has been incorporated in St Paul, with a capital of $1,500,000, which has now under construction immense feed stables, slaughtering and packing houses, and other appliances for the purpose of accommodating large herds of cattle and sheep for feeding, and packing them for shipment.....A late computation shows that New South Whales has 602,559 cattle which contain some Short-horn blood, 178,357 of Hereford, 55,299 of Devon, 2,745 of Ayrshire, 1,253 of black poll, and 162 of Jersey. Of this total of 840,385, purebreds number 53,732 head. Beside all these there are crosses numbering 476,930 .....Not less than 20,000,000 pounds of starch are made annually in Maine from potatoes.....Since January 1 sugar beets have been imported at New York from Germany to the amount of 107,231 tons, against 61,105 tons in the same time last year .....The cultivated area of the State of Kansas is estimated to be 14,352,815 acres. Of this acreage there was sown to winter wheat, 1,801,151 acres; spring wheat, 90,826 acres; corn, 5,266,035 acres; rye, 187,473 acres; flax, 122,199 acres; tame grasses of all kinds, 1,034,242 acres..... The Mark Lane Express publishes a table giving the prices of English wheat in London since 1641—a period of 245 years. The highest figure was in 1812—$30.36 per quarter (eight bushels) and the lowest in 1873—$5.30 per quarter. The present price is $7.82 per quarter.

Crops & Markets.

SATURDAY, October 23, 1886.

A telegram from San Antonio, Texas, last Tuesday, says those who are best posted on the wool market now predict that the season's clip will not exceed 3,500,000 pounds, for the reason that sheep are not shearing as heavily as expected. There was no change in prices, and holders were firm. Seven hundred thousand pounds had been received, and 678,000 pounds sold at prices ranging from 19½ to 22¾ cents per pound. Growers were well satisfied and much fewer lambs and sheep than usual will be killed this season, so as to increase the clip next year.

Here are some Cincinnati Price Current figures about wheat: Available surplus of previous growth, 25,000,000; crop of 1886, 455,000,000—total available supply, 480,000,000 bushels; domestic requirements for food and other uses, 282,000,000, for seeding, 53,000,000 total, 33 ,000,000 bushels, leaving a remainder of 145,000,000 bushels available surplus, by reducing reserves corresponding with the low point in 1882, or 120,000,000 bushels by reducing reserves to the same point as at the beginning of the year

The interruption to hog packing at Chicago, owing to the strike, didn't greatly diminish the total packing at the West, as more hogs were packed at other points. The total for all places in the West was 145,000 hogs for the week, against 105,000 the preceding week, and 195,000 for corresponding time last year. From March 1 the total is 5,150,000 hogs, against 4,515,000 last year, showing the increase to be 635,000 at date. Present prices of hogs at Chicago average closely to $4, while hog product for January delivery is selling on the basis of $3.65 to $3.70 for hogs, as cost. This would imply that if values of hog product for future delivery do not essentially improve hogs should decline 30 to 50 cents per 100 pounds to afford a margin of profit in operating.

The Canadian Agricultural Bureau reports the yield of winter wheat at 18,056,000 bushels, and of spring wheat 6,528,000 bushels, making a total of 24,584,000 bushels, or nearly 4,500,000 bushels less than the average for the last four years. The barley crop is represented by 19,656,000 bushels, or rather more than the past four years' average.

THE LATEST: Wool is easier, with a tendency toward weakness. The lockout in the knitting mills at Amsterdam and Cohoes, N. Y., checks sales and stimulates resales to some extent. The labor troubles at the Philadelphia textile mills, where a lockout to affect 75,000 employés is threatened Nov. 3 unless the latter keep agreements alleged to have been made, promise to become a disturbing influence. The switchmen's strike at Minneapolis is practically ended, after having delayed traffic for over a week. Wheat is firmer and higher on a better export demand, and the arrival of cold weather will stimulate the hog products industry. Cotton is weaker on heavy movement of new crop and pressure to sell at the South.

MARKETS BY TELEGRAPH.

SATURDAY, October 23, 1886

CHICAGO.—Compared with cash prices a week ago, "regular" wheat is 2¼c. higher; No. 2 Spring, 3c. higher. Corn, ¾c. higher. Oats, 1⅛c. higher. Rye, 1c. higher. Barley, 1c. higher. Flaxseed, 3c. lower. Pork, 2½c. higher. Cattle, somewhat higher. Hogs, a shade lower. Sheep, somewhat lower.

WHEAT.—Sales ranged: October, 72¾@74¼c; November, 73¾@75¾c; December, 75½@77¼c; May, 83¼@83¾c; No. 2 Spring, 74¾c. CORN.—Firm, Cash, 35¼c; October, 34¾@35¼c; November, 34⅝@35⅜c; December, 36½@37c; May, 40⅜@41¼c. OATS.—Firm; sales ranged: No. 2 Cash, 25¼@25¾c; October, 24⅝@25¼c; November, 25¼@25¾c; May, 30⅝@30⅞c. RYE.—Quiet; No. 2, 49c. BARLEY.—Quiet: No. 2, 53c. FLAXSEED.—No. 1, 96@97¼. MESS PORK.—Ruled active; sales ranged: Cash, $8 85@8 90; October, $8 72½@9 00; November, $8 75@9 02½; January, $9 07½@9 87½. LARD.—Steady; sales ranged: Cash, $5 70; October, $5 67½@5 75 closing at $5 70; November, $5 67½@5 72½, closing at $5 72½; January, $5 87½@5 95, closing at $5 92½. Short Ribs.—Cash, $6 87½. Boxed Meats.—Dry salted shoulders, $5 40@5 50; Short clear sides, $6 85@6 90. WHISKEY.—$1 14. For the Young.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

It was hard to say from the tone in which this invitation was shouted whether I was expected to walk off the premises or into the house. I decided to adopt the latter view of it, so I pushed open the door and walked in. I found myself in the kitchen; the members of the family not actually engaged in doing the chores had gathered there to meet me. A man, whom I found to be "Old Johnson," sat by the stove watching a pan of milk which he was heating for the calves. He had on an old, beaten hat, the rim of which lopped down at the sides and stood up straight at front and back. Through a hole at the top a tuft of gray hair stood up like an Indian's plume. A great brush of gray hair covered most of his face below the eyes. An irregular hole, apparently cut with a very dull pair of shears, had been opened in this brush about his mouth. Through this opening a set of enormous false teeth glanced into view whenever his jaws moved. He wore a ragged coat and vest and a pair of patched overalls. On the corner of the stove not occupied by the pan of milk, a young woman with very red hair and very sore eyes was frying doughnuts. A very tall, thin woman, who looked as though she had been dried and smoked for years over a hot stove, was moving wearily about at the work of setting the table, I said "good evening" and hung my coat on a nail back of the door. Old Johnson watched me keenly over his pan of milk. It was impossible to make out from his manner what he thought of me.

"Howdy, teacher," he said at last; "how be ye? Make yerself ter home. Ef they's anything ye want ye don't see, jest call fer it."

The elder woman, who I found to be Mrs. Johnson, brought me a chair. I selected a place by the stove where I thought I would not be in the way and sat down. I had had very poor luck at starting a conversation with the Bear Creek people that I had met thus far, so I said nothing but waited for old Johnson to open. He stirred away at his milk industriously for a time without a word. He monopolized so much of the stove that the red-haired young woman was driven to one corner where the wood-box on one side and the table on the other, made it impossible for her to get away from the stove. Having driven her into this inclosure, old Johnson piled so much wood into the stove that the iron in front grew almost red hot. The young womans' face grew as red as her hair, and she fairly gasped at the heat. Having accomplished this much desired result old Johnson winked at me in a way that nearly threw his false teeth out of his mouth. Then he took the pan of milk from the stove and poured it into a bucket.

"Here you Johnny," he shouted, "come here an' git this milk fer them calves."

In a moment Johnny's white head came in at the door. The little fellow smiled with pleasure as he saw me, but old Johnson's harsh voice quickly called him back to business. "What ye standin' thar grinnin' fer? Git out an' feed them calves or I'll take the strap to ye!"

The little face clouded over at once. Johnny took up the bucket and walked towards the door. It was pretty heavy for the little arms, but he tugged at it bravely. As he turned around to shut the door, there was a look on his face just like the one that had appeared when he said, "I'm gonter lick old Johnson some day."

Old Johnson leaned back in his chair with a well satisfied expression on his face.

"What ye got fer an appytite teacher?" He said at last. "Most on 'em comes here with an appytite like a hoss. The poorer the the teacher the bigger the eater—I alluz jedges 'em that way. When I wuz on the school board I alluz sed 'set by an' let me see ye eat 'afore I hire ye.' I never missed 'em onct. They done a poor thing when they 'lected this Forest in my place. I 'low we'll hev ter bridle ye up so'st ter save our vittles."

Mrs. Johnson came up to the stove to feebly defend the honor of her house. "Why Iry ai'nt ye 'shamed? He don't menn nothin' teacher—its jest his joke."

Old Johnson gave me another wink that fairly made his false teeth clatter. Then he turned his attention to the red haired young woman.

"My hired gal alluz makes it a pint to stand up for the master. She said ——"

What the young woman said must have been of a very startling nature, for the idea of having it repeated caused her to scowl in a dreadful manner,

"Look at them sour smiles," said old Johnson exultingly. "Aint that ere a putty countenance? It's lucky I got that milk offen the stove, fer that smile 'o hern would a soured it, sure's ye live. Them calves dunno how clos't they run to a sour supper."

This enraged the young woman so greatly that she shouted "shut up!" and threw a large doughnut, which, with a genuine woman's aim went as far as possible from its mark.

Old Johnson shouted with laughter till the false teeth caught at the back of his mouth and choked him into silence.

"What's the fun 'o runnin' folks ef they don't git mad? I'm sorter sorry fer ter see good fried cakes wasted, but then I s'pose they'll do ter go inter the teacher's pail 'o dinner termorrer. Say teacher, when the boy comes in I'll show ye sum fun. He's a panper, ye see. I tuck him frum the County house. His marm's sorter foolish an' he aint noways bright. You wait till he comes in."

Pretty soon Bill Johnson and Johnny came in from the barn. Johnny had soaked his face with cold water at the pump. Now he polished his red cheeks with the course towel until they shown like a bright apple.

"Say Johnny," said old Johnson, "I reckon I'll hev ter make it sos't I shall hev ter go over ter Ben Edwardses 'fore long. How'd ye like ter go an' see yer marm?

Johnny rushed forward in breathless eagerness. "When do you reckon you'll go?" he said.

"Wall," said old Johnson with a cruel chuckle, "I reckon I'll be sure fer ter go when Sunday comes in the middle 'o the week," and both old Johnson and Bill Johnson leaned back and roared with laughter at this marvelously funny joke. They seemed to wonder why I did not laugh, but I was watching Johnny's face.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: My sweet peas have gone. I am sorry to say they did not blossom till the last part of August. I waited too long. I asked Papa if the frost was out of the ground the first of May, and he said he did not think it was, so I waited till the last week of May, and I planted the seeds in fine dirt under a window and they ran as far as the window on strings. I think the reason they did so poorly is because the ground is so dry, but I watered it every night after supper when the sun was gone. But the driest part of the Summer they did not get much water because the wells and the creek were all dried up, and we had to carry all the water. Mamma has a nice verbena bed and I took care of it for her this Summer as she is not very well. We had a hard wind storm which shook all the apples off of the trees and so we will not have very many this year. Hoping I may remain a member of the Y. H. C. Your niece,

LOUISE SCHOENFELD.

DEAR UNCLE MARK: I have become interested in reading the Cousins' letters and would like to join the Y. H. C. I am a little boy nine years old and live with my Grandma and Grandpa on a farm of 160 acres. We have four horses, three calves and two cows. My Grandpa takes the RURAL and thinks he he couldn't live on a farm without it. We have sold all our hogs except one little pig which I have named Tiny. I have for a playmate a little puppy and he is a great pet and can chase rabbits and birds and I named him after the Roman Emperor Nero. I do not go to school, but study at home. For fear of the waste basket I will close now. Your nephew,

LEE BEARDSELL.

DEAR UNCLE MARK: It has been a long time since I wrote you. I expected to write long ago but something would bother that I did not get it done. I got the sweet peas, but did not plant them or any of the Rural Treasures as Mamma and I were both sick; but I will plant them next Spring, and I will write you what luck I have. We have some very nice house plants now, among them are 11 different kinds of geraniums, five different coleus, three different oxalis, two flowering maple, two hydrangea, four fuchsias, three begonias, and lots of other plants, and I have got six little orange trees started so you see I intend to have oranges to eat some day. There are no potatoes in this part of the country at all. I expect they will be high in price this year. I have got a coon for a pet. A little pedler came along one day and asked if that was a wild hog we had. Papa told him it was a coon. Your niece,

AMY UNDERWOOD.

Douglas Co., Oregon.

DEAR UNCLE MARK: It has been a long time since I wrote my last letter to you, but I hope the Cousins will excuse my silence. The weather is very fine now, just the kind I enjoy. But I don't think it will last long, for Winter is close at hand. I have been at work all Summer. I live on a farm of 200 acres, and father and I did all the work ourselves. We tended 40 acres of corn, and put in 80 acres of wheat this Fall, so I haven't had much time for pleasure, except now and then a half a day to go fishing, and there is nothing I like better than fishing. Uncle Mark, do you ever go fishing? I am going to school now. I ride to school every day four miles to Brownsville, and I have seven studies. As I come home of an evening, I drive the cows from the pasture. We have four fine calves and about 50 Berkshire hogs. Uncle Mark, couldn't you manage to crowd in a few more letters in the letter columns? I enjoy reading them so much. I wish we could have a whole page every week. The "Story of a District School" is rather comical—I like it. Uncle Mark seems shy about telling his age. My birthday will soon be here. I will be 17 years old. I went hunting yesterday and killed two squirrels. I went 'possum hunting with one of my cousins the other night, and it was nearly midnight when we got back home, and we had lots of fun, I tell you. I would like very much to correspond with any Cousin about my age, who lives in some distant state. Your nephew,

Brownsville, Mo. N. C. RIGG.

[UNCLE MARK does not go fishing very often, and when he does he has rather poor luck. He is quite a ball player though, and likes a good game of ball as well as the next one. We often play ball with a big rubber ball and a light bat. All hands take sides and some of the ladies are our best players. The dog would make a good fielder, for he will run and pick up the ball in his mouth as though he wanted to play too. I like to see boys and girls, and men and women too for that matter, play ball. It is a good exercise and does nobody harm if played as it should be.]

DEAR UNCLE MARK: Will you let me join the Youths' Horticultural Club? I am 12 years old. Pa has taken the RURAL NEW-YORKER for three years. I don't know whether you can read my writing or not. I have not studied writing much, but I am studying farming. Can you tell me what will kill cabbage lice. There are a great many on our cabbage this years. ERNEST FURLONG.

Lawrence Co., D. T.

[Buhach will kill the insects.—U. M.]

DEAR UNCLE MARK: I am a little girl, nine years old, and I thought I would write you a letter this cold day. We live by the side of Lake Champlain and it looks cold and lonesome. We can see the snow on the Green Mountains in Vermont. It looks like Winter. We have a bushel of walnuts and over a bushel of pop corn, so Uncle Mark if you will come and see us you may have some to eat. We have four pigs, two-year-old ones, and two young ones. The young ones can jump a fence as well as any boy. It is fun to see them jump out of their pen. I have a cat; his name is Spot. When he is poor he will play and is very nice, but just as soon as he gets fat he gets so lazy that he won't do anything but sleep under the stove. MINNIE SIBLEY.

Essex Co., N. Y.

[I have a great mind to stop work and come at once. It is probably more fun to see those pigs jump over the fence than it is to drive them back again. I have seen pigs before now fastened to a stake by tying a rope to one of their hind legs. Some people as well as some cats get lazy when they eat too much.—U. M.]

DEAR UNCLE MARK: I have written you several letters and have had but one printed. But I am not discouraged, and thought I had better write again, for I guess the Cousins have forgotten to write lately, by the looks of those advertising columns.

I was 13 years old on Sept. 3rd. I had quite a number of presents given to me. My sweet peas came up quite well, and were very nice (what there was of them), for between the chickens and the dry weather there were not many left, though I tried to take good care of them. My brother and sister and I have three little Bantams (two hens and a rooster) that a lady gave us. We have not named them yet. Perhaps you can tell us some nice names for them. I raised eight rows of onions this Summer; the rows were nearly four rods long. I would like to correspond with Lena Bennett, of Hector, Schuyler Co., N. Y., for she is about my age, and I hope if she sees my letter in the RURAL, and wishes to correspond with me, she will write me a letter.

Yours respectfully, SADIE E. WRIGHT.

North Ridge, N. Y.

[I should have to know more about the Bantams before I could name them. It is better to name our own things, then we will think more of them.—U. M.]

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

THE COCAINE HABIT.

THE WORST SLAVERY KNOWN—NEW REVELATIONS OF POWER.

Cincinnati Times-Star.

WHEN cocaine was first discovered, the medical world exclaimed "thank heaven!"

But useful as it is, it is also dangerous, especially when its use is perverted from the deadening of pain for surgical operations, to the stimulation and destruction of the human body. Its first effects are soothing and captivating, but the thraldom is the most horrible slavery known to humanity.

J. L. Stephens, M. D., of Lebanon, O., was intervied by our reporter yesterday at the Grand Hotel, and during the conversation the doctor said: "The cocaine habit is a thousand times worse than the morphine and opium habits, and you would be astonished," he said, "if you knew how frightfully the habit is increasing."

"What are its effects?"

"It is the worst constitution wrecker ever known. It ruins the liver and kidneys in half a year, and when this work is done, the strongest constitution soon succumbs."

"Do you know of Doctor Underhill's case here in Cincinnati?"

"That leading physician who became a victim of the cocaine habit? Yes. His case was a very sad one, but the habit can be cured. I have rescued many a man from a worse condition."

"What, worse than Dr. Underhill's?"

"Indeed, sir, far so. Justin M. Hall, A. M., M. D., president of the State Board of Health of Iowa, and a famed practitioner, and Alexander Neil, M. D., professor of surgery in the Columbus Medical College, and president of the Academy of Medicine, a man widely known, Rev. W. P. Clancey, of Indianapolis, Ind., from personal experience in opium eating, etc., can tell you of the kind of success our form of treatment wins, and so can H. C. Wilson, formerly of Cincinnati, who is now associated with me."

"Would you mind letting our readers into the secret of your methods?"

"Well, young man, you surely have a good bit of assurance to ask a man to give his business away to the public; but I won't wholly disappoint you. I have treated over 20,000 patients. In common with many eminent physicians, I for years made a close study of the effects of the habits on the system and the organs which they most severely attack. Dr. Hall, Dr. Neil and Mr. Wilson, whom I have mentioned, and hundreds of others, equally as expert, made many similar experiments on their own behalf. We each found that these drugs worked most destructively in the kidneys and liver; in fact, finally destroyed them. It was then apparent that no cure could be effected until those organs could be restored to health. We recently exhausted the entire range of medical science, experimenting with all known remedies for these organs, and as the result of these close investigations we all substantially agreed, though following different lines of inquiry, that the most reliable, scientific preparation was Warner's safe cure. This was the second point in the discovery. The third was our own private form of treatment, which, of course, we do not divulge to the public. Every case that we have treated first with Warner's safe cure, then with our own private treatment, and followed up again with Warner's safe cure for a few weeks has been successful. These habits can't be cured without using it, because the habit is nourished and sustained in the liver and kidneys. The habit can be kept up in moderation, however, if free use be also made, at the same time, of that great remedy."

"Yes, it is a world-famed and justly celebrated specific! Like many other physicians, I used to deride the claims made for it, but I know now for a fact that it is the world's greatest blessing, having sovereign power over hitherto incurable diseases of the kidneys and liver, and when I have said that, young man, I have said nearly everything, for most diseases originate in, or are aggravated by, a depraved condition of the kidneys."

"People do not realize this, because, singular as it may seem, the kidneys may be in a very advanced stage of decomposition, and yet owing to the fact that there are but few nerves of sensation in them the subject will not experience much pain therein. On this account thousands of people die every year of kidney disease unknowingly. They have so called disorders of the head, of the heart and lungs and stomach, and treat them in vain, for the real cause of their misery is deranged kidneys, and if they were restored to health, the other disorders would soon disappear."

Dr. Stephens's experience, that can be confirmed by many thousands whom he has treated, adds only more emphasis to the experience of many hundreds of thousands all over the world, that the remedy he refers to is without any doubt the most beneficent discovery ever given to humanity.

PERSONALS.

THE Grand Duke Nicholas, heir of the Czar, has consumption, and it is feared he can't get over it.

PRESIDENT CLEVELAND has appointed "Cousin Ben" Folsom to the Consulship of Sheffield, England—salary $2,500 and fees about as much more.

ANY insurance company that will insure Dan. Flowers's Montana cattle range and secure him against all loss this Winter can have $250,000. This is Flowers's standing offer.

MISS MOLLIE GARFIELD is reported engaged to Stanley Brown, who for so long had confidential relations with the late President Garfield, and was his private secretary after he went to the White House.

CHIEF-JUSTICE Waite is said to be a persistent pedestrian. He walks daily both ways between his home in the West End of Washington and the Capitol and cheerfully greets acquaintances he may meet.

THERE are in the employ of the Government 550 Smiths, 360 Browns, 320 Johnsons and 270 Joneses. The number of those who bear these names who are willing to serve the Government has never been recorded.

SENATOR WARNER MILLER is often seen on Broadway. He wears a great man's shabby hat, but otherwise cuts a disappointing figure to those who expect to see something remarkable about a Senator of this great State.

PHIL. ARMOUR says: "The day of Chicago's supremacy as a pork packing center will soon be a thing of the past. Kansas City, Omaha, Cedar Rapids and other Western points are fast taking the business away from here."

JUDGE Manning, of Louisana, the new United States Minister to Mexico, arrived at the City of Mexico Tuesday and was greeted by representative American merchants and others. It is understood that he will re-open the Cutting case.

MISS ROSE ELIZABETH has struck for $300 a month salary and a half interest in Literary Life. Capitalist Elder is undecided whether to lock out, or take the salary himself and give Miss R. E. the magazine. It was on its last legs when she bolstered it up.

THE Tennessee Republican candidate for Governor, Alfred A. Taylor, at the age of 15 delivered a lecture in Faneuil Hall, Boston, on the condition of the negro in the South, and one year later spoke from the same platform with William Lloyd Garrison.

THE President, Monday, appointed Dabney H. Maury to be United States Envoy Extraordinary and Minister Plenipotentiary to the United States of Columbia. Mr. Maury was nominated to this office during the session of Congress, but the Senate did not act upon his nomination.

GEORGE F. EDMUNDS has been re-elected United States Senator by the Vermont Legislature, receiving 228 out of 264 votes. There was but one vote against him in the Senate and 35 in the House. He first took a seat in the United States Senate on April 5th, 1866, and has served continuously since.

SENATOR GORMAN, of Maryland, was one of the few who were in favor of the sweet-wine bills which were defeated in the Senate last Winter. He is now in California, and has been invited by the Viticultural Society to visit the grape districts and make a study of the wine question at its home. He will probably go to Napa, Sonoma and Los Angeles Counties.

OCTOBER 10 Mrs. Grant received $150,000 from Webster & Co., as her share of the profits from "The Personal Memoirs of U. S. Grant." With the other payment made Feb. 28, 1886, this makes the total receipts to date $350,000. Out of the sum still due, but not collected, she is entitled to something over $100,000 more, and she receives 70 per cent of the profits on all sales while the copyright runs.—28 years.

MR. DANA, of the Sun, paid the $500 bill of Holmes & Co., for embalming Gen. Grant, and Col. Fred. Grant, on behalf of his mother, sent a check for the amount to Dana, and in the accompanying letter denied the validity of the claim, and cast reflections of Dana's motive for paying the bill. C. A. Dana was in Europe at the time, but his son Paul declined to receive the check, on the ground that Col. Grant's statement as to the validity of the claim rendered it impossible to do so.

Miscellaneous Advertising.

A Great Reward

will be secured by those who write to Hallett & Co., Portland, Maine. Full information will be sent you, free, about work that you can do and live at home wherever you are situated. That will pay you from $5 to $25 and upwards a day. A number have earned over $50 in a day. Capital not needed. Hallett & Co. will start you. Both sexes; all ages. The chance of a lifetime. All is new. Now is the time. Fortunes are absolutely sure for the workers.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1919. NEW YORK, NOVEMBER 6, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Vineyard.

THE NEW GRAPES—G. W. CAMPBELL AND BELL.

T. V. MUNSON.

In 1881 I selected seeds of Elvira and Campbell's Triumph grapes from the finest berries of the finest clusters grown on young, thrifty, four-year-old vines. The seeds were planted in open ground late in the same year in rich, loamy, sandy land, and many hundreds of each of these lots of seed came up nicely the next Spring. During the Summer every plant that showed any weakness was pulled up. About 15 of the finest of the Triumph seedlings, and probably 100 of the Elvira seedlings were planted in my test vineyard. The soil—ordinary limestone, now cultivated for nine years without manure of any kind—with the commonest kind of attention produced a healthy, vigorous growth of these vines equal or superior to the parents. In 1884 they bore a few clusters, and from the first their quality attracted marked attention. They have increased in productiveness and size of cluster, until this season when our long, severe drought materially reduced the size of both cluster and berry. The G. W. Campbell ripens about two weeks earlier than its parent, approaching the foreign Chasselas. It ripens with the Delaware, and so far seems as hardy as any of Rogers's Hybrids with much less rot. Several other Triumph seedlings are very fine; but all are late like their parents, or later, good only in the Middle and Southern States.

Quite a number of the Elvira seedlings have proved of great excellence, but the particular one here referred to is designated in my records as No. 21, and with the name "Bell." It is the finest Elvira seedling I have in quality, yellowish white, quite early persistent, productive, of excellent health and growth; skin tough and not at all inclined to crack like its parents. It showed no indication of rot, even last season when the rot was so severe here. Still I would not call it rot-proof, as even the Norton sometimes has a few rotten berries, though one of the most resistant. I think it will prove hardy wherever Clinton is hardy, and it ripens earlier. It takes the Rupertris species fully to sustain "rot-proof" claims, and of this steel-clad species we are now getting some fine improvements. In purity no species excels it.

Dennison, Texas.

R. N.-Y.—Mr. Munson sent us quite a number of his seedlings which were received July 29 in perfect order. We have selected two for illustration; *viz.* G. W. Campbell, see Fig. 410, and Bell, see Fig. 409. The berries of the first were about the size of fine Delawares, very juicy, sprightly, vinous, no pulp, one to two seeds, white with bloom, the skin tough though thin. We consider it of fine quality. The Bell is sufficiently described by Mr. Munson. Such grapes sent to Northern markets by August 1st, would meet with a ready sale.

MR. P. BARRY sends us a basket of grapes from his cold vinery. One bunch of Calabrian (white) weighs 38 ounces. Of the several different kinds we should prefer the Alicante (black) for its large, showy berries, as well as for its quality.

Floricultural.

THE WINDOW GARDEN.

WILLIAM FALCONER.

All plants should now be arranged and in place for Winter. Coleuses, alternantheras, acalyphas, dracænas and rex begonias, had better be kept in warm quarters, though not necessarily in sunny windows. Oxalises, nasturtiums, bouvardias, heliotropes, carnations and callas in bloom love the sunny windows. Sweet alyssum will keep on blooming in company with violets, pansies, carnations, Paris-daisies, meteor marigolds and mignonette, in a light window, even if the temperature will now and then descend to the freezing point. Chinese primroses now are coming into bloom and are admirable window plants: they will even thrive inside a light, cool room, away from the window for many days. I have Chelsea Blue Chinese Primrose now in bloom: the flowers are good, and of a pleasing dark lavender color. Lobster-claw cactuses (Epiphyllum) are in their fullest beauty from October into November. They don't want sunshine. Cactuses of all sorts and other succulents too, for instance, century plants, stapelias, yuccas, cotyledons and sedums, if kept rather dry at the root and overhead, may be kept in the shady places till next Spring. Ferns of all sorts love faintly shady places, while cinerarias and calceolarias love to be kept cool and near the glass; they dislike direct sunshine, and should be kept from freezing. While a slight frost will not hurt the calceolaria it will kill a cineraria as fast as a heliotrope or balsam.

REPOTTING.—Don't do this if you can avoid it. Cinerarias and calceolarias may need repotting, but very few other things will. A window isn't a greenhouse, hence you cannot with impunity repot your plants in November or December.

STIMULANTS.—If the nasturtiums, Paris daisies, callas and other vigorous plants have become tightly pot-bound and exhausted the soil, scrape off some of the surface earth and replace with a compost of turfy loam and finely rotted manure, half of each. Liquid manure is a nasty thing to use in a dwelling-house.

WATERING.—Never use icy water. That at a temperature of 50 to 60 degrees, or about the same as that of the room in which the plants are growing, is best. All plants in full growth, as callas, cinerarias, Chinese primroses, heliotropes, stevias, nasturtiums and streptosolons need lots of water, but never water them if they already are wet; wait till they begin to get dry before you give them a further supply. To stove plants, that is, pelargoniums, fuchsias, coleuses, plumbago, abutilons and the like, that you are merely wintering over for next year's garden, only give water enough to keep them from shriveling. And give very little water to your "cutting" pots, that is, the rooted slips you are keeping on in pots. Cactus and other thick-leaved plants should get very little water; indeed, there is no call for giving a cactus a drop of water before next March. Camelias, azaleas, myrtles, bays, oranges and other evergreen shrubs should never be allowed to get dry at the roots; at the same time, never deluge them.

CLEANING.—Pelargoniums and almost all plants that have recently been lifted from the open ground and potted to keep over Winter will lose many of their leaves, also a good many ends of branches may mold, or the fallen petals of flowers may lie on the foliage and rot spots in it. Look to this and remove every bit of decaying matter you may find on or about your plants. November and December are the worst two months for molding and decaying leaves.

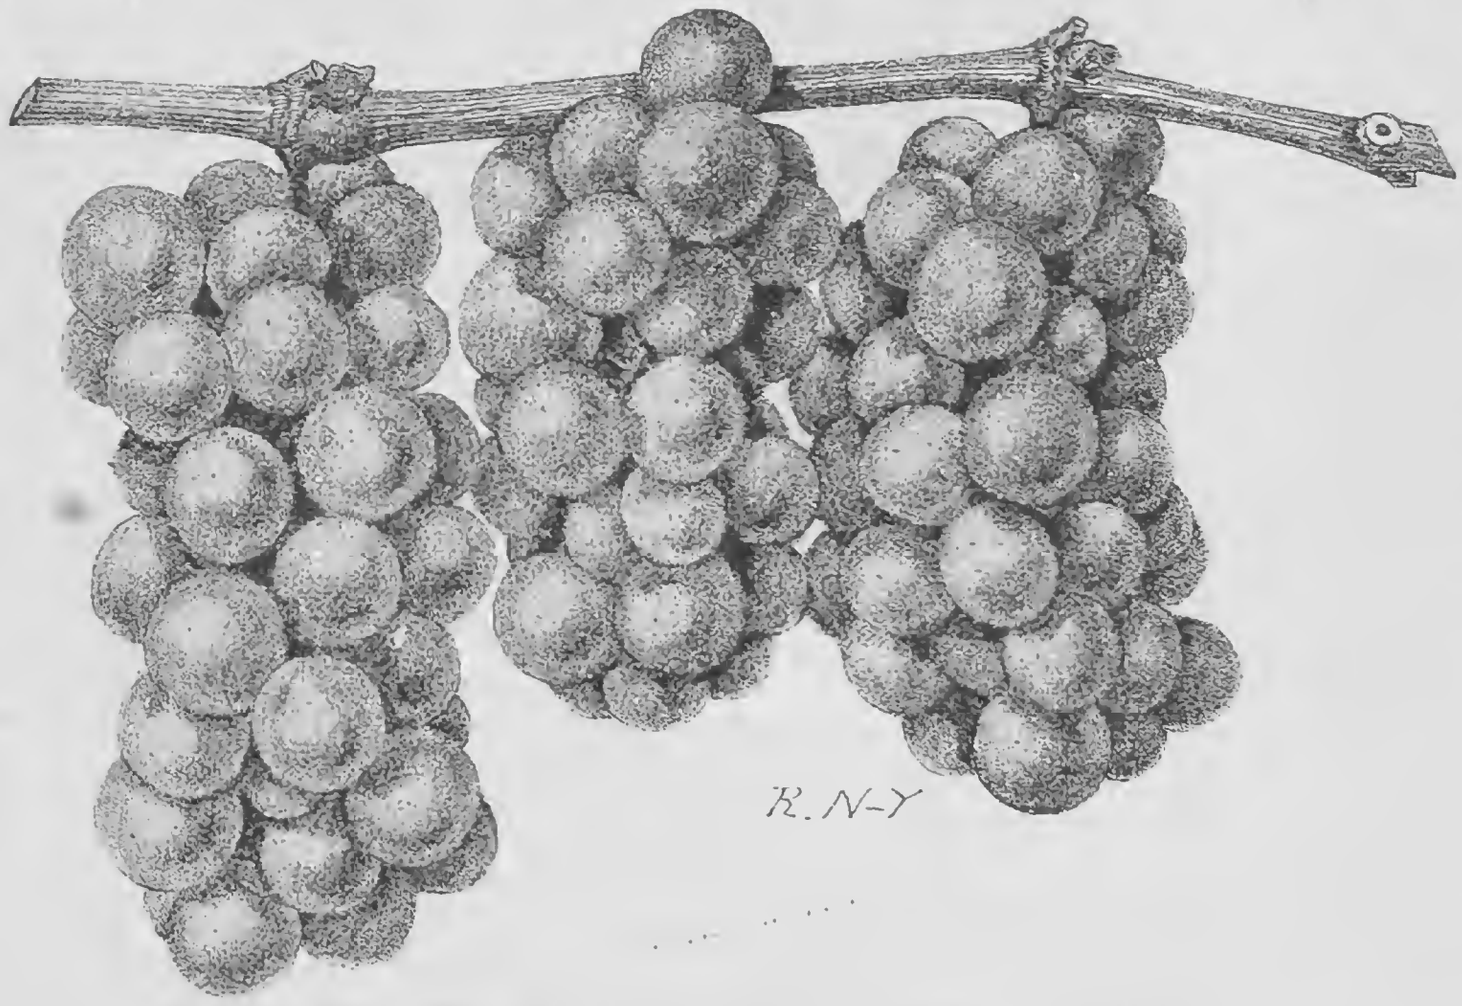
INSECTS.—Eternal vigilance alone can keep these in check. Green fly are extremely partial to calceolarias, cinerarias, the young growths and flower buds of roses, and like tender morsels. Brush or wash them off, or dip the plants (but not the roots) head foremost in tobacco water the color of very strong tea. Fumigating with tobacco smoke in a dwelling-house is too disgusting to be entertained, and I can assure you as impracticable (except on paper) as it is offensive. Red spider too have to be washed or brushed off. Sprinkling the foliage with water will never rid the plants of "spider," no matter how often you may be advised to the contrary; furthermore, it is utterly impossible to keep the atmosphere of a dwelling-house so saturated with moisture as to kill or even dispel red spider. Tobacco in any form is harmless to this rapacious little pest, and the same is true in the case of mealy bugs and scale. These last two must also be washed or brushed off. How aggravating it is to find that our bouvardias and cactuses that were planted out in Summer and looked so clean and thrifty, are now so freely sprinkled with mealy insects But such is very often the case; the bugs repair to the ground and live about the roots while the plants are out-of-doors in Summer; but on indoor plants they forsake the roots in favor of the tops. Look out for little green worms on your mignonette, heliotrope and other plants.

FROST.—While Chinese primroses, calceolarias, Paris daisies and rose geraniums will bear a slight frost with apparent impunity, chrysanthemums will bear a few degrees, and pansies, violets and carnations a good many, not one of them is benefited by frost. Therefore be on the safe side and don't let any of your house plants get frozen.

VENTILATION.—Ventilate freely in warm weather, but avoid draughts even in genial weather. In ventilating don't open the windows wide all at once, but rather a little at a time. Ventilate early and shut up early.

"DUTCH" BULBS.—Keep them cool and let them alone. If you want fine, large, showy flowers don't hang up your bulbs. The Roman hyacinths are about the first that will come into flower.

LILY-OF-THE-VALLEY. — I have a bed of this in an open sunny spot and every Fall after cutting over the leaves I mulch the beds with a heavy coating of well rotted manure. In Spring I get splendid sprays from this patch, and in Winter it yields me my roots for forcing. I lift them in large clumps, shake the earth away from them, then tear them apart into bunches just big enough to get into a nail keg. I get the empty nail kegs from the stores in the village, they don't cost anything, saw them across the middle and use the bottom ends for my Lily-of-the-Valley, and capita pots they make. By starting in September the clumps are in good condition for forcing in December, and the foliage comes up with the flowers. I leave them outside till hard frost is likely to occur, then transplant them to a cold-frame where I can get at them handy whenever I want them for forcing in Winter. After forcing, I return the plants to the bed whence they were first taken where they soon recruit themselves, grow and open, and in a year or two, are apparantly as good as ever.



ELVIRA SEEDLING (No. 21) BELL. From Nature. Fig. 409.

The Herdsman.

LIVE STOCK NOTES FOR NOVEMBER

NOVEMBER, with its fogs and sleet by day, and its frosts by night, is a rigorous month for the stock that are unprovided with warm shelter. No animals should be at large at night during this month; and none can be expected to pay its owner for the feed it consumes if it is exposed to the cold in open, comfortless

sheds. The sheds and stables should therefore be made tight and weather-proof. A good supply of leaves, if they can be procured, should be stored while dry to be used as litter. Leaves are the most comfortable and cleanly bedding for all kinds of stock, and when decayed make valuable manure.

HORSES.

The most thorough grooming should be given to all the horses, to cleanse the skin and remove the scurfy matter which gathers upon it and prevents free perspiration. This causes a feeling of cold, and chills the animal. A healthy coat of soft hair is very warm, being an excellent non-conductor of heat, and good currying and brushing secures this soft, healthy coat. If horses are annoyed by any vermin or itching of the skin, apply a little crude petroleum to the brush, and work it in the skin. If freed from these pests now, freedom will be secured through the Winter.

Brood mares should be spared from hard work and well fed. The foal is now arrived at a stage when its growth draws heavily on the mare's system. The pregnant mares should not be irritated or worried, lest the disposition of the foal should be affected by it. Good temper should be encouraged by kind treatment. A roomy, loose box should be provided for brood mares, in which they may move around freely. They are less fretful when unconfined by a halter. Work horses require careful attention after having been exposed to a cold storm. They should be rubbed dry as soon as they are brought into the stable, and then blanketed for a time. The rubbing is useful to restore the circulation in the skin.

Some persons think clipping horses in the Winter advisable, and some think otherwise. If a horse is clipped the operation should be performed at once. A horse may be clipped which has a thick, wooly undercoat, that holds the prespiration and keeps damp. This is hurtful and keeps the animal thin and poor, and often causes hide-bound. Horses with a thin coat don't need clipping.

Colts require some increase of food at this time. Over-feeding with grain is to be avoided. The best of hay should be given to growing colts, and a quart of oats daily is enough for a newly weaned colt. If a colt has not been yet weaned it should be separated from the mare without delay. Don't forget to use the brush on the young colts and weanlings. The training of a colt should be begun at once. The first lesson is to use it to the halter and to be tied up and led. The halter should be strong enough to resist all attempts to break it. If it is once broken the colt will not forget, and will make a halter-pulling horse, which is a nuisance.

The harness will now need overhauling, cleaning and soaking with oil. To clean the harness, take it all apart, wash it with warm water and soap, using a sponge and brush; wipe it dry, and rub in as much warm tallow and lamp-black as will be absorbed, and rub off the excess with a cloth until the hands are not soiled with it. Soft harness will not gall the skin.

Give salt at least twice a week; avoid condition powders, saltpeter, resin and all other popular "remedies," which do more harm than good. Feed and water regularly; use the curry-comb and brush; keep the stables clean, and your horses will need no physic.

COWS AND CATTLE.

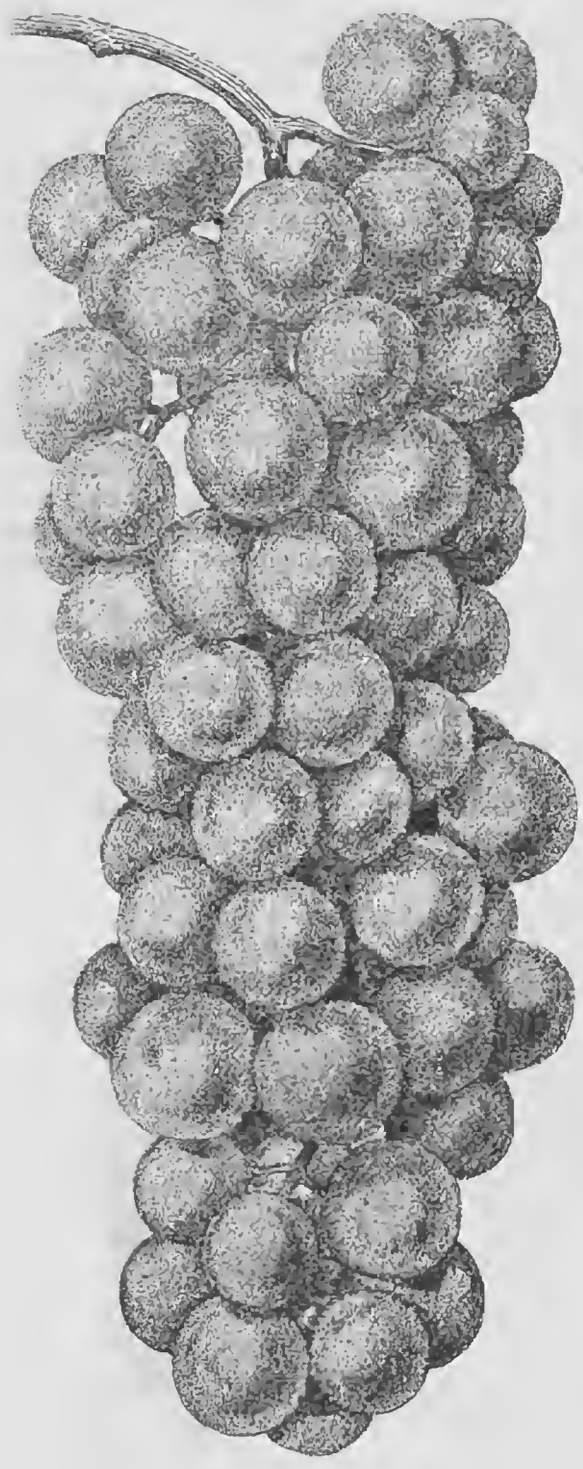
Give the cows a mess of ripe, sweet apples, sliced or chopped with a sharp spade, and a quart or two of bran with them, and note the difference in the milk pail. The cow will be grateful, if she does not return it in milk. Be careful in feeding apples or roots to cattle. It is very easy for a piece to slip down the wrong way and it is not always easy to get it back again. Remembering the danger, one will exercise due caution. The card and the brush will show the good results in the milk pail. There will be more milk and there will be no hairs in it. Ample short litter will make clean cows. Lay in a stock of dry swamp muck for use in the cows' stables.

A leather neck cover to keep rain and snow from the oxen under the yoke, will prevent sore necks. Keep ox stables clean; it will prevent sore feet.

Calves should have a pen and yard by themselves and as comfortable a lodging as the cows have: it will avoid danger of accidents (?) by which the young animals may be injured. A lousy calf will not thrive, and almost all calves will be pestered by these vermin if they are not protected against them. Fowls should be kept out of the stables or the animals will surely become infested with fleas and lice. Rats and mice also convey these pests into farm buildings. The remedy is a few well-fed cats and open places under all the buildings. Calves that are still unweaned should get their milk warm and it should be given as long as it can be furnished.

SWINE.

March pigs should be thought of now In choosing a boar for service, a year old and well grown one will be preferable to an older one. A pure bred one should be procured at any reasonable cost. Healthfulness and soundness of constitution are points that should be insisted upon. Close breeding insures weakness of constitution. Sound, vigorous parents produce strong, healthy progeny. Brood sows require exercise. A close pen is injurious to them. Grain food alone is not advisable. Cut corn fodder and clover hay, wetted and mixed with bran and middlings, are readily eaten by the sows, and make a good substitute for roots. But where brood sows are kept roots should be grown for them. Give all the store pigs a run in the cleared corn field, in the potato lots and root fields, as long as the weather permits. A temporary shed should be provided for use in stormy weather. Their usual feed, however, should be given in addition to what they pick up. A clean pig is an evidence of carefulness and thrift. It is a



R. N-Y.

G. W. CAMPBELL GRAPE. From Nature
Fig. 410. (See first page.)

rare sight, but a most pleasing one and the beauty of it is evident to the sense of smell as well as to the sight. The fattening of swine should be hastened by the most liberal feeding. When a pig has eaten all the corn it can, it will eat a little more if a lean, hungry pig is turned into the pen. When a pig is once filled up it will eat but a little at a time. More food will be eaten by a fattening animal if a little is given often, than if a large quantity is given at once. Feed the pigs at least four times a day, and for drink give water with some finely ground corn meal stirred in it. The secret of rapid fattening is to get the most food into the stomach in the shortest time. The first pork in the market is made for the least money, and brings the best price of the season.

Keep store pigs in a growing condition. As a rule, no pigs should be fed over Winter except the brood sows, and the March pigs should make the fall pork. But if any are kept over Winter they should be gaining weight all the time. Soft corn is not a fattening food If given to fattening pigs, at least one meal a day of sound, dry corn or peas should be given. Hogs which run at large on the range in the Southern States and feed upon the mast which is now fallen, will do better with one feed of corn a day. It will pay to keep a supply of corn in the lot and go half a mile daily to feed it to the swine. Sweet potatoes are excellent food for swine and where they are grown cheaply should be raised for this purpose. Sweet, ripe apples make the best of pork for domestic use when given with some corn, and they are very healthful food. The common practice of running the pigs in manure stables is objectionable, and leads to disease. At this season the bedding of the pigs in the hot manure is exceedingly hurtful and should be avoided.

SHEEP.

Push on the lambs. But to do this they must be kept in a yard by themselves. Keep the stock ram in vigorous condition by a daily allowance of corn and rye mixed. Ewes that are safely in lambs should be given a little extra food. The quality of the lamb and the strength and milk of the ewes will depend upon this. Where sheep are not sheared in the Fall, a dry shelter should be provided whenever they are kept out of doors, as in the South. Fall-sheared sheep suffer less from the cold winter rains than unshorn ones whose fleeces hold so much water that they chill and benumb the animals. This fact applies everywhere to sheep exposed to wet and cold together. Dry beds are indispensable for sheep at this season, and damp air is to be avoided. Sheep laugh at dry cold; but are made miserable by wet. An unhappy sheep will soon be a sick one.

Examine the feet of the flock and pare overgrown hoofs. When a sheep is seen upon its knees, look to the feet; they will be found in bad condition and in need of attention. See that salt is given at least once a week; and observe regularity as to the time of feeding, especially with fattening sheep.

POULTRY.

All poultry intended for fattening should be put up at once Three weeks of feeding will make a fowl as fat as can be. Clear out all the dead-heads. A fowl is a small thing, but it will eat its head off very soon. Male birds are useless and should be got rid of somehow. The cost of feeding one over Winter, will be as much as that of a good pure-bred bird from some other flock. If early eggs are desired a warm spot in a sunny corner should be made with a few hot-bed sashes, and a few hens given quarters in it. Fresh bones broken into small fragments or coarse bones are the best form in which to give lime for making egg shells. A few clean nests made of bright straw will go a long way towards the appearance of eggs from the early pullets. Clean out vermin and make the fowls happy by the liberal use of petroleum about the house, keeping the floor clean and well dusted with dry air-slaked lime. A dry earth floor well warmed by the sun will please the fowls and impel them to sing their lays all through the Winter. There will be no eggs where the fowls shiver through the dismal November days in a dark, dreary, damp, cheerless house, no matter what feed is wasted upon the flock: Warmth and sunlight are the most effective provocatives of fresh eggs at this season.

BOGUS PEDIGREES.—Jersey breeders in this country have been having trouble about bogus pedigrees. Grades have been sold as pure bloods. Prompt measures have been taken to put a stop to the matter. The English Cleveland Bay Society has also had to contend with forged pedigree certificates. Men can be punished for obtaining money by false pretenses.

THE FATTENING OF DEER for market was practiced in Hertfordshire, England, in the last century. On 250 acres 350 deer were kept through the Winter, and 30 sheep and 10 cows were pastured with them during the Summer. The winter feed was hay, straw, grain and tree foliage. The browse left in making faggots of ash, elm and spruce was saved and fed out. This was said to save hay and give a more gamy flavor to the venison. The fat deer sold at $75 per pair. Various writers of late have proposed the raising of fat rabbits on waste tracks of land. How about fat deer?

Sheep Husbandry.

Notes from the Western New York Farm.

WINTER FEEDING OF SHEEP OR LAMBS.

THE SHEPHERD AN IMPORTANT FACTOR.

No matter what class of sheep are fed, whether it be mature sheep or lambs for fattening, or ewes for early lamb raising, the profit can come only from the amount of growth as compared with the food consumed. While much depends upon the selection of sheep and of the food used, success or failure is very largely dependent upon the characteristics of the man placed in charge. It may seem strange that so much importance should be attached to the mere agent supplying food and water and scattering litter in their pens. Most people look upon these as mere mechanical operations, and think that any one, even a "wooden man," who could fill the racks with forage, and the troughs with water, and daily distribute the grain and roots, would be all that could be required; but every feeder of experience knows that there is a wonderful difference in the way in which these things are done and in the men who do them. Sheep are peculiar animals, and seem to have likes and dislikes; to some men they have an aversion and never cease to be afraid of them, and whenever they approach the yards the sheep will cease to eat and run about like mad; others they readily take to, and soon come to care nothing for their presence anywhere in and about the pens. A peculiar man is needed and the young feeder cannot be too particular in his selection.

A SHEPHERD SHOULD NOT BE a rough, boisterous, noisy, quick-tempered, or a swearing man; such a one is very disagreeable to have about; he is sure to kick and cuff the sheep and to keep them in a constant state of unrest, and, no matter how thoroughly or promptly he does his work, the sheep cannot make the highest gain with such treatment. Besides, such a man is very apt to care more for story-telling, and the society of similar companions than for the the quiet of the sheep pens, and thus be tempted to hurry up his work and be away and not to come back till the very latest moment, and such neglect though seemingly but a little matter, counts very largely on the wrong side when figuring profit.

I shall be asked, no doubt, how swearing disqualifies a shepherd. As a rule swearing men are quick-tempered and to this there are so few exceptions and a quick-tempered man is so very objectionable that it is safest to reject every swearing man when choosing for so important a position.

WHAT THE SHEPHERD SHOULD BE.—He should be *good-natured*, and this to such a degree that though the sheep in their eagerness at feeding time should happen to get him down and run over him he will not fly mad and ill-treat them (this is about as severe a test of good nature as can be given). He should be *observant*, should know the sheep and see that every one has an equal chance at its food, and if raising early lambs he should be able to select any lamb and its mother; in short, he should see that everything is right, and be able to instantly detect anything wrong with any individual sheep. He should possess *good judgment*, which with his observation will enable him to determine when the sheep are receiving as much food as they can profitably eat and digest, and when any change in the proportions of the different ingredients may be desirable. He should be gentle and quiet; every movement made about the pens should be so made as not to disturb or frighten the sheep. Of two men having the other qualifications, the one nervous and quick in every motion, the other quiet and even rather slow, I would choose the latter, for, though he might not accomplish quite as much in a day, he would do what he did in such a way that the sheep would not care for him and with the same food they would make greater gain. He should be *methodical* and *prompt*. A sheep's stomach is as good as a clock (better than some) and when it is time for them to be fed they want it, and if it is not forthcoming, they will rush impatiently around the pen and soon run off as much flesh as the feeding would gain, so that the shepherds should feed every pen promptly on time, and always in the same order. He should *love the business*, not alone for the money it brings him, but because he has a love for the sheep. No matter how much the shepherd pets and fondles the sheep and lambs, never find fault, as in this case he will never abuse or neglect them, and the sheep are as quickly won as any other animal, and if well treated they soon come to know the attendant, and his presence does not disturb or disquiet them. Of course, it goes without saying that the shepherd should be strictly and conscientiously honest; otherwise he will shirk as much as possible and when not watched neglect the sheep, and in no other animal does neglect tell so quickly or disastrously.

NEVER CHANGE SHEPHERDS unless absolutely necessary, as every change, even from a worse to a better one, disturbs the sheep and causes more or less loss of flesh. Select good ones as soon as possible, and then let each one have charge of the same pens and always of the same sheep. It is as true now as of old that the "good shepherd knows his own sheep and the sheep know his voice," and "he carries the lamb in his bosom," and when a good shepherd is secured he is a jewel, and should be retained year after year, even if asking what might be considered large wages.

THE OWNER'S EYE BETTER THAN ALL.—But no matter how good and trustworthy the shepherds may be, the sheep feeder should have a general oversight of the whole business, and not only this, but he should be always about and familiarize himself with every detail. He should possess every good quality desired in the shepherd and be able to detect the least neglect or delinquency on his part. And then every shepherd, no matter how good he may

be, likes to have the owner about to consult with him, and will naturally do better if he sees that he is working for one who is master of the business, and who takes a lively interest in it.

* * *

A friend at Lyndonville, N. Y., asks if fattening sheep and lambs will eat cut straw any better than the long, and if it would be better for them. Fattening sheep, when fed largely on bran, linseed meal and other nitrogeneous foods, and also mangels or other green food, will eat largely of straw, and it pays to give them all they will eat; but I could never see that it made the least difference to them whether it was cut or not. All the advantage I can see in cutting straw for this purpose is that the manure is finer, and can be handled a little more easily, but in this respect there is not half the difference with sheep manure that there is with that from any other stock. It will pay to put the straw under cover for in this case the sheep will eat it very much better.

* * *

Another friend in Williamstown, Vt., asks if he could stock his 150-acre farm with coarse-wooled sheep and have them do well; also if he could keep up the fertility of his farm as well with sheep as with cows; also if sheep kept for spring lamb raising should be kept as warm as for fatting.

Coarse-wooled sheep will not bear close stocking; that is, putting them in large flocks. In all the countries I have ever visited in which coarse wools are kept, from a dozen to 50 are as many as are allowed together, and even in Winter I have observed that the long-wools, when put more than 20 in a flock, always have more or less culls among the number. I should much prefer the middle-wools or cross-bred sheep. There is no doubt that sheep will keep up the fertility of land fully as well as cows. They will certainly keep it much freer of weeds. But in feeding any stock no improvement of the farm must be expected, unless other foods than those raised on the farm are used. It does not enrich a man to take money from one pocket to put into the other; no more does it enrich the soil to put manure on one field made from feed taken from another; but when bran, oil meal and other foods, rich in the elements of fertility, are brought upon and fed on the farm, and the manure is put upon the fields, then will its fertility be increased. The saving of foods by housing store sheep is as great in proportion as with those fattening, as cold has precisely the same effect upon the one as the other. If they need exercise give it to them by a brisk drive, returning to the stables at the end.

Farm Topics.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

I DO not exactly understand, Mr. Editor, why you should ask an old landlubber like me to write for your paper, when so many smart young men are filling it up with the latest and most improved views of things. When a man gets to be 60 and upwards he is generally supposed to believe that all progress and improvement have come to an end, and that it is time to rest and be thankful. Well, it is. There is no doubt of that. I am resting—when I can get a chance—and I cannot help being thankful and saying with the shepherd king, "Surely goodness and mercy have followed me all the days of my life." But certainly there is a great deal of writing in the agricultural papers yet of which it can be said, as was said once by an old minister of a young minister's sermon, that it contained many new things and many true things, but the new things were not true and the true things were not new!

One able editor expresses his opinion that "the day has passed when farmers can afford to spend their time in the study of the formation of Greek and Latin roots and all their lifetime remain in ignorance of the formation, nourishment and growth of corn, wheat and apple-tree roots." Now, as old as I am, I cannot remember the time when farmers ever did spend much time in the way named. One might travel among them many a day's journey before he could find one of the "horny-handed" who could even tell what a Greek "root" is, or how it differs from a parsnip. I have a suspicion which may do him injustice, that the writer himself didn't know. But he wanted to make the point that farmers need an education suited in some degree, at least, to their business. They do; but those who are now farmers must gather that education themselves, by experience, by conversation, by reading and, above all, by keeping their eyes and minds on the alert for knowledge that will do them good.

THERE is a good deal of agricultural knowledge among farmers. Each knows something that others do not know. I never spent half an hour going over a neighbor's farm in his company during which I did not pick up something well worth knowing. We do not visit each other enough. Each farmer has an agricultural college all around him, on his own farm, as well as on his neighbors'. Let him learn and reduce to practice what he may learn in these ways, and in time he can graduate with the well-earned degree of M. M. F.—a regular Money-Making Farmer.

IT is the fashion to call the older farmers narrow-minded, bigoted, unprogressive. But some who appear so to the hasty observer are pretty full of meat, as you may find if you know how to get it out. It is quite often the case that ways which seem awkward and behind the times are really the very best ways to follow under the circumstances, and in the conditions that exist. The newcomer may not see this. It is hardly likely that he should, for such facts have to be learned by experience. Eastern people have had a good deal to say about Western farmers burning their corn for fuel. The forestry fellows are urging the farmers everywhere to plant wood-lots. If we are to raise our fuel, who can say that we cannot raise it cheaper from seed-corn than from seed-acorns? Even manure wasting may be justifiable under certain circumstances.

ONE, and the chief cause of slow progress among farmers is, too much land not paid for. Indebted men can rarely do as well as they know, and are still less able to make experiments, or branch out into new things. While the old way may not be the best, it may be the safest way to meet one's interest without failure, and pay a little on the debt. Oh! that debt! How much better it would have been to have bought only as much land as you could pay down for. The most profitable land (and often the only profitable land) is that which is well fertilized and well tilled. Men who have sunk all their capital in a farm, and yet have not paid for it, are in poor condition to get a profit out of their farming. It is getting more and more difficult to make anything on borrowed money. That is the secret of the present low rates of interest.

WITH all the outcry about hard times, I do not see that farmers who are out of debt have any great cause to complain. Where is there any honest business that is paying any better interest on the investment, or for the work done? I do not know where to look for it. The grumbling farmers are either the unskilled or the indebted ones. The only exception I know is one who has wanted to get rich fast and has been trying to breed fast colts. But that is not farming.

DOES butter making pay? Is your granny a woman? Butter is a luxury—good butter, I mean. Corn and potatoes are staple articles, and like all that class of goods the profit per cent. is small, and much of them must be handled to make much money. But when farmers have the monopoly of something that everybody with money wants and will have if it can be had, what have they got to complain of? Some of my neighbors have been selling their butter as low as 14 cents. Others have not sold a pound for less than 25 cents. One who keeps between 20 to 30 cows says, "I haven't sold a pound of butter for the last five years for less than 50 cents." Here is a man whom oleo does not scare. He milks his herd the year round, averages 275 pounds of butter to the cow, grows every mite of his own feed, and buys not an ounce of fertilizers. Let him die to-morrow and let his next neighbor who has sold his butter for 14 cents take the farm and stock, and the first lot of butter he sends off will be graded as all his butter has always graded—near the bottom. There is more in the man than there is in the land—or the cattle.

IN Massachusetts the Democrats have nominated two farmers for Congress, and very popular farmers too, Russell, Secretary of the Board of Agriculture, and Burnett, President of Bay State Agr. Society, whose recent fair was such a success. Will the farmers of the other party vote for them? It seems to me that it is about time for us to throw off the party harness, and put our votes where they will do the most good for the people. As long as the leaders feel sure of us, they will do just as they please, and many of them are very well pleased to sell their votes to the corporations which treat all the farmers' demands with scorn. Something has got to be done to break the power of our big monopolies. The RURAL's head is mighty level on this subject.

NOW is the time for the young farmers to start up that farmers' club. Let the boys go ahead, elect their officers, and invite the old men in. Invite your mothers and sisters, too, and make the invitation strong enough to secure their attendance. Let the subjects for discussion at each meeting be so varied as to have some interest for all. Don't wait for the old men to lead off—let it be a young farmers' institution, and push it on with all your youthful vigor. Elect your most enterprising member as president, with the one with the best literary gift as secretary. The local paper will be glad to print his reports of the meetings. A good jokist is a valuable member, and such often puts shrewd thoughts in the most effective way. The farmers' club is an agricultural college that is open to all.

CORRESPONDENTS' VIEWS.

FREE AND SECTARIAN SCHOOLS IN TEXAS.—Of all the aids to civilization, free schools are hardest to start in this country. The majority of the people object to being taxed for the purpose of educating the negroes. The Catholic Church here is a great drawback to free education, as it is more in favor of parochial schools. The Baptists and Methodists have each built fine brick buildings for the education of colored people. The schools are well patronized and conducted. These sectarian schools do not encourage the public school system as they might, because they are not entitled to any benefit from the large school fund. A proposition to lay a tax of one-fourth of one per cent. on all the taxable property in the city for school purposes is submitted to the people, but cannot be carried.

Marshall, Texas. A. G. N.

DRESS BECOMINGLY.—A man rode down on the cars with me the other day who has money enough in bank to support him for the rest of his life without doing a stroke of work. He always complains that when he goes among business men he can't command the attention that other farmers do He thinks people make fun of him because he is a farmer. He had on an old hat with a broken rim and a quarter of an inch of dust in the wrinkles. His shirt collar had no starch in it, and he wore an old-fashioned stock. One leg of his pants was rolled up far above his shoe. He had not cleaned his shoes since coming in from the stable. No wonder he didn't get the respect he thought he ought to have. At a cost of $5 he could have given himself the appearance of a good business farmer. Nobody expects a farmer to but on a "stovepipe" hat or kid gloves when he goes out on business, but he can at least look respectable. H. A. J.

Orange Co., N. Y.

WE can sell our calves at $12 when a month old. Yearling heifers, common stock, sell at about the same price. According to these figures it will not pay to raise a calf unless it is extra good. We are pretty safe in patronizing a good bull, however, for even if the calf is a bull we can sell it for enough to pay for the service. If it is a heifer we can afford to raise it.

Bergen Co., N. J. V. H.

Farm Economy.

A CONVENIENT PRIVY.

WHEN we moved on our farm three years ago (for we were city born and bred), our privy was a constant offense to us; for we had been used to the clean and convenient water-closet. It was situated quite a distance from the house; but in the most prominent position, with the entrance exactly facing the road. Right adjoining our kitchen piazza I had a snug little closet built, so that we had no need to step off the stoop. I procured two common pails, and had one placed on a shelf directly under the seat. Then there was a little door opening from the outside through which the pail could be removed, which is done daily, oftener if my family is large enough to make it necessary. In front of the seat there is a step made of a box, with a hinged lid, and it is filled daily with the ashes sifted from the kitchen range, and a small fire shovel hangs beside it. Every morning the pail is taken out, and its contents are carried to the manure pit, and the empty one, which has been airing from the day before, is put in its place.

We think we have solved the problem, for the ashes keep down all unpleasant odors. We have a good earth closet, and it costs us nothing but a little time, for we built it out of the old privy—and it is a comfort never to have to step out of doors in stormy weather or at night. AN OLD SUBSCRIBER.

[R. N.-Y.—We presume coal ashes are meant. Wood ashes would not answer so well, and there are other uses to which they could be profitably put. Road dust, or dry sand or muck will answer admirably and cost nothing but the labor to secure them. This matter of farm sanitation is a most important one.]

CHEAP SHED.

THE shed shown at Fig. 415 is usually made of poles in this country; but can be just as easily made of sawed timbers. It can be of any length, but should not be more than 30 feet wide for a double shed, or half as wide for a single shed. It consists of three rows of posts two or more feet in the ground, five to seven feet apart. The middle row should be enough higher than the others to give sufficient pitch. Each row should have a strong plate 4x4 or 4x6. No cross-ties are needed, except at the ends to receive the sidings. Rafters pass each other on the ridge pole and are fastened together by pins, as our grandfathers fastened theirs. They should also be spiked

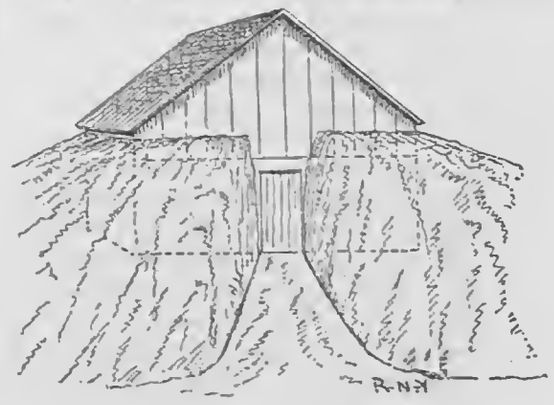
CHEAP SHED. Fig. 415.

to plates. The top can be sheathed and shingled or covered with hay or straw and weighted down. Framed barns are made in this country on the same plan. All cross-ties and beams are done away with, which makes them much more convenient for hay barns.

Corneau, Mo. GEO. W. F.

CHEAP ROOT CELLAR.

I MADE a cellar as shown at Fig. 416. Nothing freezes in it even when the mercury touches 30° below. I dug a hole in the ground about four feet deep, and then put in a frame with 1½-inch lumber perpendicularly around it, and banked it up with the earth I took out. I put in joists with a floor 10 inches below the earth banked around it, and filled in the 10 inches with sawdust, laid a row of tile drain



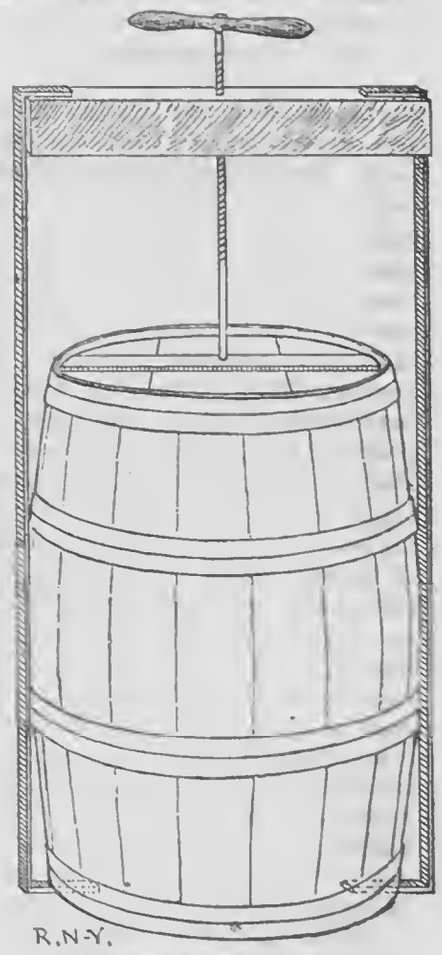
CHEAP ROOT CELLAR. Fig. 416.

just outside the heavy plank and put 2x4 scantling on the ground on which to lay a floor. This I find better and cheaper than having a cellar under the house or above ground with double walls filled in with sawdust. Rock or brick walls would be better yet, if one could find the materials handy.

Hancock Co., Ind. A. H. B

BARREL PRESS.

G. W. PELTON & SONS of Sauk Co., Wis., have in use the arrangement shown at Fig. 414. Two pieces of strap-iron two inches wide and 40 inches long, are fastened by screws on to a 3x3 oak joist 20 inches long. The straps are bent at the bottom of the barrel, as shown in the cut, and fastened both at the



BARREL PRESS. Fig. 414.

end and top of the joist. A screw is placed in the center of the joist. This plays upon a follower eight inches wide and long enough to go across the head of the barrel. Fill the barrel full, place the heads in position with the follower crosswise of the heads; adjust the screw and press the head into place.

Dairy Husbandry.

A SCRUB COW AND HER DESCENDANTS.

THE illustrations and remarks on the scrub in a late RURAL remind me of an experience I have had with the offspring of a cow during nearly a quarter of a century. Twenty-two years ago I purchased an old scrub that had been brought up on the plains of Nebraska—a poor old red, raw-boned thing that had never seen a fence and had been kept tied to a stake and fed a half bucket of hard corn ears three times a day. The hide around the base of her horns was all worn away by the rope. Cows then were very dear here and very scarce. The only noticeable peculiarity with regard to her qualities as a milch cow was the large quantity of butter made from the very small yield of milk. She never tried to pass over a fence, even when it was no higher than her knees, and she was a very delicate eater. We kept her several years, feeding her with great care. She gave milk for five years and then calved, giving milk up to calving. We got two heifer calves from her; the sires were scrubs running loose. This old cow improved somewhat in her milk yield. Her heifers were carefully treated. Their offspring were treated equally well. We now have two cows by scrub bulls from that old cow's offspring. They resemble the old cow, except that they are very fat. They are just alike, and we have made 14 pounds of butter per week for several weeks from one, besides using cream freely. No richer, nicer milk was ever tasted. The skim-milk is a delicious drink. Our neighbors around have fine, costly, pure-bred Jersey and Aberdeen-Angus cows, but there is not one among them equal to ours.

I ascribe this to unceasing daily care. Never once has either of them been neglected. They have been pets, fondled from birth. They were just as easily milked the first time as the last. They have had good pasture all Summer; fine clover hay all Winter, and nice slops of chopped feed twice a day the year round, with access to the best salt and water.

Meanwhile, people complain that fine stock deteriorates here, the climate is unfavorable! The truth is, they feed nothing but dry corn and poor hay. They are surprised to hear of "slopping" cows. After each milking twice a day, we give a good, liberal pail of mixed feed to each cow. No matter how full they may be, they are perfectly crazy to get this. They come right up to be milked to get that bucket of feed. I incline, therefore, to believe, that good feed is half breed. C. J.

Holt Co., Mo.

The Poultry Yard.

QUALITY AGAINST FEATHER.

HENRY HALES.

THE main object in keeping or raising any kind of live stock on a farm is profit. How much this has been over-looked at different times during manias for certain breeds of poultry and other animals is a matter of history. A few years ago Jersey cattle were much admired for form and beauty, while too little regard was paid to their milking qualifications. Many animals realized high prices on pedigree alone; now the butter or milk test is taking the lead. It is high time that more attention should be given to individual fowls regarding their laying capabilities. It is not enough that a breed should be entirely relied upon for its productiveness; individual hens, known as better layers than others of the flock, can always be picked out by an intelligent poultry breeder on a farm, or by a fancier. Much more benefit would be derived by selecting such hens to breed from, than by sacrificing such excellent qualities for the markings of feathers. This is especially so with the farmer who makes profit from eggs, not from the sale of birds. The fancier can select such hens from his best pens, but the fact is, we hear of nothing of the kind being done, as he pays more attention to markings. That there is a very great difference in birds of any particular breed I am sure from long experience. Take Light Brahmas, for instance; I have known some flocks where the hens laid but a very few eggs and then wanted to sit, spending most of their time eating or sitting, while another man's fowls of the same breed kept on laying all Winter. In one instance of this kind the flock of hens were shut up in a garret in the business part of New York City. In another case, a friend kept a popular breed that proved very poor layers; he changed for several different strains of the same breed with no better results; yet this same breed have done well with other people. It was not the care, but only the character of the birds that made the difference. It can be easily seen that selection for quality among the birds in any flock is of as much importance as the selection of breed that is supposed to possess said quality, and of far more importance than selection for feathers. If every farmer's wife or children who take charge of the poultry, will notice which hens lay the most and largest eggs, no matter what the breed, if good varieties, set their eggs and select the pullets for keeping—if this is done for several years, the result will be a fine prolific lot of poultry that could not be obtained by any other means.

FOWLS FOR TABLE.—At English shows, poultry fitted for the table is shown. There is found to be a great lack of skill in preparing the birds in an attractive form. A cross of the Dorking on the Game gives the best table bird. It is thought that birds from such a cross will be fit for roasting earlier than any other.

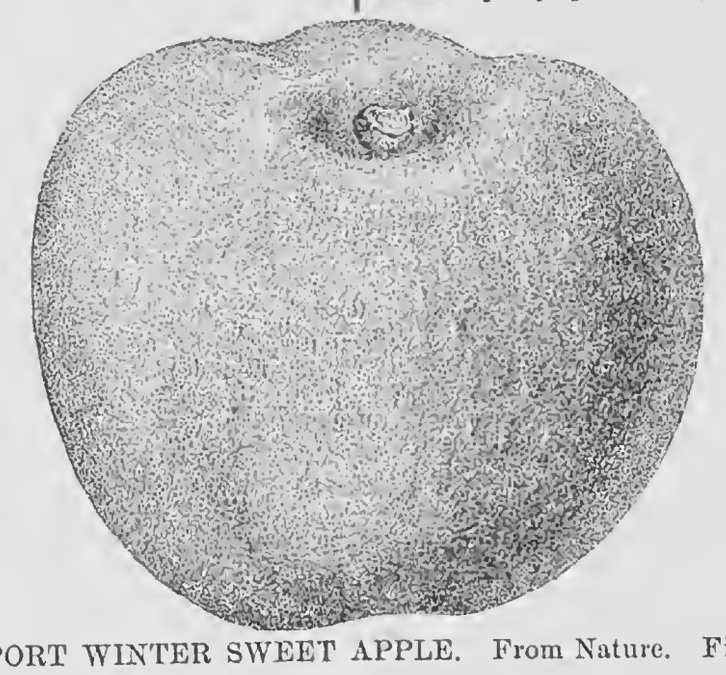
PRIZES FOR PRESERVING EGGS.—The first prize on eggs preserved for three months at the London Dairy Show was won on a lot of eggs packed in sweet bran with the small ends down. The second prize lot had been rubbed with a mixture of olive oil and beeswax and packed in coarse salt. The third prize lot had been rubbed, when new-laid, with mutton dripping and then put in powdered, dry lime. All these were in good condition for cooking at the end of 90 days.

Pomological.

NEWPORT WINTER SWEET.

T. H. HOSKINS, M. D.

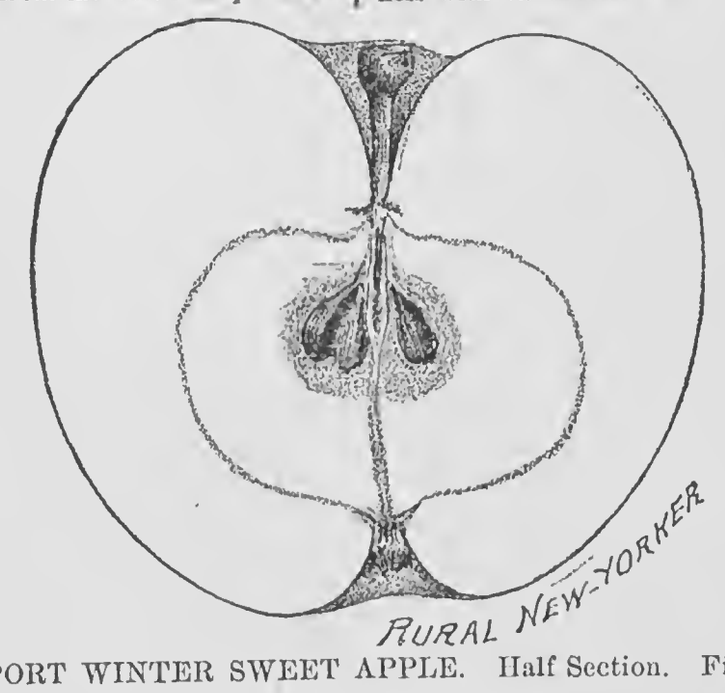
THIS apple (Fig. 412, with cross-section at Fig. 413) is a native seedling of Newport, Orleans Co., Vermont. The original tree, which, until the present season, is the only one which has produced fruit, is about 40 years old and is situated in an open field, where it sprang up, about half a mile from the west shore of Lake



NEWPORT WINTER SWEET APPLE. From Nature. Fig. 412.

Memphremagog. It is perfectly sound and healthy, and produces a large crop nearly every year. Six years ago I top-grafted cions from it upon a number of small nursery trees, which were set in an orchard the next season, and have this year produced their first fruit, from one of which the engraving is made. As these young trees, as well as the old one, passed through the fearful test Winter of 1884-85 (during which the thermometer four times went more than 40 degrees below zero, wiping out entirely my Ben Davis, Tolman Sweet, Red Astrachan, and all the root-grafted Favorites) without even the slightest injury, this variety may safely be claimed to be a true "iron-clad." It is a free-growing sort, with long, slim branches and twigs, the trees forming round heads with limbs drooping to the ground, even when grafted quite high. The leaves are a dull green, whitish beneath, quite narrow and partially folded, giving the tree a unique look, not unlike a willow.

The apple, which is a long keeper, is at maturity grass-green in color, with a brownish-red cheek, ripening during the Winter to a clear straw-yellow. In form it is roundish-conical, sometimes slightly ribbed or angular. The stem is short, not large, in a shallow, abrupt cavity; calyx small and closed in a very small, regular basin. Flesh white, core small, with smallish, dark-brown seeds. Flavor a pure sweet without bitterness or acidity, rather rich, making it considerably better than Tolman for eating uncooked, while it is quite as good for baking. In size it runs rather larger than Tolman. It seems equally productive, and I believe it would be a better apple to grow, even where the seasons would admit of a less hardy sort. The Tolman lives here through all but our hardest winters, but produces very little fruit.



NEWPORT WINTER SWEET APPLE. Half Section. Fig. 413.

Indust'l Societies.

AMERICAN HORTICULTURAL SOCIETY AT CLEVELAND.

(RURAL SPECIAL REPORT CONCLUDED.)

Improvements in marketing through co-operation of growers; bagging grapes; Ulster Prolific and Poughkeepsie Red Grapes; bagging as a preventive of rot; close of the convention.

AFTER the reading of a paper on "Horticulture in the Mountain Regions of the South," by Dr. Samuel Hape, Mr. Myrick read a paper on "Selling Peaches," by Wm. P. Corsa, of Delaware. An outline of the operations of the "Delaware Fruit Exchange" was given, and the advantages to growers fully set forth. This was the third season of active operations, he said, with increased success for the Exchange and those doing business with it. Better distribution and more uniform prices are secured, and the condition and grading of peaches are improved. The commission men, of course, oppose this method of growers selling their own produce. Many advantages claimed for the system were enumerated, and the writer concludes with the following pertinent sentence: "I believe that if a determined effort could be made in many localities to improve the marketing methods of farm products, we would introduce a wholesome thrift into agriculture that would eliminate much of the lottery nature that now palsies effort."

President Earle spoke of the necessity of bagging grapes. "Where I live we cannot grow grapes at all without bagging, they rot so badly. All through Southern Illinois, Missouri and Arkansas, the rot is universal. Almost every kind rots, no matter about the soil or anything else. Rot can be largely prevented by bagging, by which we get delicious grapes. The cost does not exceed one-half cent per pound certainly. I think, in all that region of rot, grapes can be grown with profit by bagging."

Mr. Green, "I think this discussion should not close without some mention of the Ulster Prolific and Po'keepsie, which we now have on the tables here. They certainly are very fine and promising." Inquiry was made as to how far north the Ulster had been grown, without eliciting any reply, the variety not being planted much as yet. Mr. Smith, of Wisconsin: "Bagging improves the grapes. I heard of a gentleman who sold bagged grapes for twelve cents, when those unbagged from the same vine brought only seven. Bagging makes them a few days later." Mr. Myrick had understood that bagging made the skin thinner and the grapes would not stand shipping as well. Mr. Caywood: "Such I think is the fact; they are more tender when so ripened." Members generally agreed to this. If grapes are kept perfectly dry they never rot. Mr. Crawford: "I find the Po'keepsie Red not a good grower, no better than Delaware; would like to have it much better. Empire State makes a much better growth than either Ulster or Po'keepsie."

Friday, the next day, was wholly given up to sight seeing. The members took an early train for Lake View Cemetery and Euclid on the invitation of the Eastern Cuyahoga Horticultural Society. The Garfield remains and monument were visited. On alighting from the train at Euclid, on the Nickel Plate Road, all were driven through the many extensive vineyards there, 3,000 acres in extent, and were greatly pleased with the high and successful culture everywhere shown. In the afternoon a sumptuous banquet was partaken of on the shady lawn of E. H. Cushman, where the Euclid Concert Band discoursed pleasant music. After this President Earle called out many pleasant speeches in response to appropriate toasts from members and guests, and it was nearly night when the party returned to Cleveland. H. H.

NORTH AMERICAN BEE KEEPERS' SOCIETY.

(RURAL SPECIAL REPORT.)

Converting honeycomb into beeswax; melting the comb; the solar wax extractor; its discovery; "separators"; foul brood and the remedies; honey plants; alsike, etc.; Chapman's honey plant; the "coming bee"; control of mating a prerequisite of artificial improvement.

THIS society held its 17th annual convention October 12—14 at Indianapolis, Ind., several other organizations of bee keepers joining it in convention.

The process of converting comb into beeswax was thoroughly explained in a paper by C. P. Dadant, Illinois. This can be accomplished by artificial or solar heat; but many inexperienced persons spoil their wax either by melting it without water, by over-boiling, or by using dirty iron kettles. When comb is melted over the stove it is not absolutely necessary to have an apparatus made especially for the purpose. Any ordinary boiler will answer, but plenty of water must be used and only a moderate heat should be applied. When the wax is melted a basket of wire cloth can be placed inside the boiler and sunk down in the melted wax. The wax can then be dipped up inside the basket of wire cloth which acts as a strainer, and prevents the coarser impurities from being dipped up. Even the oldest and blackest combs will make nice yellow wax when thus treated; but, as a matter of course, a wax extractor will leave the wax cleaner at the first melting. If steam is used in melting comb it ought not to be turned directly upon the comb, but into water below it, the steam often damaging the wax, giving it a granular character and greenish color. This unpleasant result is sometimes brought about by over-boiling. If some wax remains in the dregs it is not advisable to throw it away; put it in a box and expose it to the weather which will dissolve the foreign substances, but not the wax, when it can be re-melted. Cappings of honey, removed when extracting, ought first to be allowed to drain, and then be washed, the sweetened water thus obtained can be used in making vinegar. The solar wax extractor makes the best wax, as it not only melts but partially bleaches it. So far but little use has been made of this invention, but the time is not far distant when it will supersede the steam or stove wax extractor.

O. O. Poppleton, Iowa, said that he discovered the use of solar heat for melting wax, about 10 years ago, when he was experimenting in wintering bees under glass. The heat of the sun melted the wax. The melted wax from a solar wax extractor ought not to stand

n the shade, but in the sun's rays, where the wax will remain in a liquid state which allows the impurities to settle, when the pure wax can be dipped off the top. From 500 old combs, each one foot square, he had secured 100 pounds of wax. A. I. Root, Ohio, said that those who had small quantities of wax to render could put the combs into a sieve, set the sieve and contents in a dish pan, and place all in a stove oven, when the wax would melt and run through into the pan.

Mr. N. N. Betsinger, of New York, gave a history of "separators;" that is, sheets of wood, tin or some other substance placed between the sections for the purpose of compelling the bees to build straight combs. Glass was first used, but the breakage was great, and the bees attached many combs to the glass. They also attached combs to wood, and, strange though it may appear, the smoother the wood the greater the trouble. This same objection applied to the use of tin. Mr. Betsinger believes that the use of any unperforated substance for separators lessens the crop of honey, hence he has, for the past four years, been using wire cloth for this purpose. The meshes are four to the inch, which allows the bees to freely pass through. After the wire is woven it is dipped in molten metal, which fixes the wires so that the meshes will remain of the same size. Mr. B. has a patent upon his invention.

A paper written by A. J. King, New Jersey, entitled "Foul Brood," was next read. Mr. K. has spent a year in Cuba managing an apiary of nearly 400 colonies, and when he first took it in charge he found nearly 100 colonies affected with that dread disease called foul brood. He thought it was first introduced into the apiary by purchasing queens from infected districts. He cured it by using what is known as the "phenol" cure. The method he employed is as follows: some phenol crystals are dissolved by placing them in a bottle in hot water. To one part of the dissolved phenol is added 499 parts of a mixture composed of one-third pure honey and two-thirds water. This is heated to 150 degrees Fahrenheit and then fed to the bees. At the close of the reading of the essay, Mr. R. L. Taylor, Mich., said that he thought that the descriptions of foul brood were not always interpreted correctly; many think that before the bees have foul brood the combs must be full of dead brood, and the odor is so great that it can be detected by simply walking in the vicinity of the hive. This description may be applicable to the advanced stages of the disease; but when it first appears only a few cells will be affected, and the odor is not noticeable unless the nose is brought close to the diseased brood. The brood, when dead, is of the color of coffee with milk in it. If a pin is thrust into the dead larva and an attempt is made to effect its removal, it will draw out "stringy" to the length of an inch. It finally shrivels and dries up, and looks like a speck of tar upon the lower side of the cell. He is curing it in his apiary (where it was spread by feeding honey taken from infected colonies), by what is known as the starvation plan. The bees are shaken from the combs into an empty hive, and shut up until they have consumed all the honey in their sacks, when they are given their liberty and fed.

Upon the subject of "Honey Plants" Mr. A. I. Root, Ohio, said that it is desirable that a plant should be cultivated for something aside from the furnishing of honey. For this purpose Alsike Clover stands at the head; buckwheat comes next, then rape and raspberries. He was not certain that there are any plants that it would be profitable to raise for honey alone; possibly there are a few. Sweet clover, figwort, spider-plant and the so-called Chapman honey plant, are the most promising of any plants that yield honey alone. The latter yields honey during a drought better than any plant with which he was acquainted. It is a biennial resembling a thistle, blossoms just after basswood and continues in bloom about three weeks. It is self-seeding and requires no attention after it is once started. The seed should be sown in early Spring. Mr. Root had visited Mr. Chapman, of N. Y., last Summer, for the purpose of learning more in regard to the plant. Mr. Chapman had two acres of the plant in bloom, and his 130 colonies of bees were gathering honey from it in such quantities that they were building comb in the sections and storing it with honey. The honey is white, and of a nearly pure sweet taste. Mr. T. F. Bingham, Mich., mentioned that the stalk is of a very fibrous nature and perhaps the fiber might be utilized in the manufacture of straw paper. Mr. H. Chapman, N. Y., had ground 2¼ pounds of the seed, and pressed from it nine ounces of fine, clear oil.

R. S. Taylor, Mich., read a paper upon "The Coming Bee," in which he took the ground that nature had, for centuries been turning the bee in exactly the direction most desirable, which has not been the case with some of our domestic animals, and, until the mating of the queens and drones can be controlled, there is little that can be done for the improvement of our bees; but if this is ever accomplished, we can do with bees in 10 years what would require 100 years in breeding cattle. If ever an improvement is made in our bees, Mr. Taylor thought it would be done by a crossing of varieties.

C. P. Dadant, Ill., thought prolificness is a very desirable trait. A. B. Mason, O. disagreed; the most prolific queen he ever had was the least profitable. Large quantities of bees were reared, but they stored no great quantities of honey. W. Z. HUTCHINSON.

Genesee Co., Mich.

What Others Say

PITTING POTATOES.—A writer in the Philadelphia Weekly Press remarks that if many potatoes are to be kept over Winter, pitting them is much preferable to putting into the cellar. Only enough should be put into the house for use during severe cold weather when the pits cannot be got at. Much sickness in farmers' families in Winter is due to keeping large quantities of potatoes and other vegetables stored under sleeping rooms. Besides, in the pit potatoes can easily be kept at a uniform low temperature without freezing. Most cellars are too warm the greater part of the time, and yet are liable to freeze in sudden cold spells. In pits the temperature varies only slightly. Potatoes for pitting should be dry and covered, first, with six or eight inches of straw. Then cover with four to six inches of dirt, leaving a hollow around the heap with an outlet on one side to carry off water that may settle there. Just before cold weather add a second light covering of straw and a heavy coating of dirt. If the ground is frozen so that dirt cannot be got, use manure from the horse stables. At the first covering a wisp of straw should be left sticking up through the center for ventilation. At the second this may be covered up with soil or manure. Potatoes thus kept will not freeze and will come out in Spring hard and sound, with only trifling loss of weight. In warm cellars there is often a loss of one-sixth or more by evaporation, shrinking and rotting.

VICTORIA.—After all we have said in favor of Miner's Victoria Grape, we are glad at length to have a little support from other grape authorities. Mr. J. T. Lovett, of Little Silver, N. J., prints the following in his fall catalogue: "The Victoria is the best white grape yet introduced. I have carefully and thoroughly tested the entire collection of Concord seedling grapes raised by the late T. B. Miner, and I find that Victoria far exceeds in value all others, and is of remarkable merit. I have now fruited it for several years, and find it without a fault, both in vine and fruit. The clusters are large and handsome, berries medium to large, most attractive, greenish-white with light bloom; pulp tender, rich and sweet, quality good to best. Vine exceptionally free from mildew, a strong grower, entirely hardy and very prolific. One of the few grapes that have not as yet been affected by rot. This invaluable grape has been figured and frequently commented upon editorially by that best of agricultural papers, the RURAL NEW-YORKER, and I can fully indorse all that has been said in its favor."

COLORADO TOBACCO.—Among the exhibits made by the State Agricultural College at the Exposition, Pres. Ingersoll writes us that there were eight "hands" of tobacco, representing seven different varieties, grown by Professor Cassidy in the Agricultural College grounds from seeds furnished him by Mr. Colman, the Commissioner of Agriculture. In the opinion of Professor Cassidy the showing made by Colorado is a very favorable one. The climate and the soil are both suited to the growth of tobacco, and the question as to whether it would be a profitable industry depends for its answer upon the quality of the tobacco raised. Owing to the fact that the conditions of the soil and climate in Colorado are different from what they are in the East, it is possible that a peculiar and very excellent kind of tobacco may be grown.

CATS AS RABBIT EXTERMINATORS.—Some portions of Australia have become literally covered with rabbits. They eat crops and gnaw the trees in a most disastrous manner. The idea of exterminating them with cats was conceived. Large numbers of cats were bred for the purpose. These are kept for a time in wire cages and fed upon rabbit meat entirely. When they are released they are left to support themselves. The Agricultural Gazette says that the plan has worked admirably. The cats multiply and the rabbits are killed in vast numbers. It will be as hard to get rid of the cats, eventually, we fear.

SEVERAL cases have occurred in England of late where people have been prosecuted for keeping poultry because the roosters made such a noise in the morning that late risers could not sleep. Of course, such trouble arose in towns where the houses are close together. A screaming rooster is as bad as a howling dog—so think the people who like to turn day into night. Poultry lovers in such cases will be forced to let the roosters go and keep hens alone. A rooster that will not crow is worse than a hen that will.

WIDE AWAKE ITEMS.

IN an old book on horse breeding, published in 1721, we are informed that no stallion should ever be used before he is six years old; that 20 mares in a season is an extreme limit of service, and that a foal should suck until it is 12 months old. Did they have better horses in those days, or has not improvement in horses kept pace with progress in other sorts of breeding!.....

PERMANENT PASTURES are looked upon by Prof. Arnold as a stumbling block in the way of progressive dairying and a thing to be avoided, except under peculiar circumstances. He tells the Farmers' Advocate that permanent pastures and meadows are great institutions in the eyes of lazy and dull men, and perhaps are as well suited to their capacity as anything .....

PASTURE land in its best state generally pays the poorest of any of the arable part of the farm, and permanent pasture poorest of all. There are several reasons why this should be so. First, the grass in a pasture is necessarily unthrifty, because it is so frequently cropped. No plant can flourish and be vigorous which is denuded of its green herbage. Every time it is wounded by cropping its growth is put back. It stands still, or grows but feebly, till it recovers from the shock and has time to gather renewed energy sufficient to throw out new shoots, only again to be stunted, and to repeat the same thing over and over again through the season, or until frost silences any attempt at growth. The present season has furnished a sorrowful demonstration of the short-sighted policy of subjecting cows solely to the uncertain supply of food furnished by pasture only, even if of the best and freshest sort. Almost all sections have suffered more or less. And this is repeated to some extent every year. Cheese factories and creameries have been closed for lack of milk, and the returns from private dairies have dwindled to a ruinous pittance almost everywhere, and loss is common. Prof. Arnold takes the view that all this is avoidable—not a necessity. Such men as Hiram Smith, of Wisconsin; John Gould of Ohio; Harris Lewis, of New York, and Edward Burnett, of Massachusetts, and many others of the same sort, go through such crises without wincing at all, and make money while others are losing. These men have learned that it is unwise to put their sole trust in pastures, especially old ones, and that tillage and rotation of crops are better, and by their steady success, whether drought prevails or not, they are public examples of the fact that, be the seasons what they may, hot or cold, wet or dry, dairying is one of the most profitable and certain of all agricultural industries when a fair share of common sense is employed in its management. .....

A WRITER in our London contemporary, the Fanciers' Gazette, is of the opinion that it does not make as much difference as people think, whether hens are allowed to sit or not, except in often-sitting breeds. In others, if they are debarred they lay rather sooner than if allowed; but to set against this, they usually get broody again very much earlier, so that in a year's account there is not much difference .....

NEAR Stockholm (Sweden) a farmer and his father before him have successfully cultivated tobacco upon the same few acres of land for nearly 50 years.....

THE Agricultural Gazette (England), says that silage to subserve the best ends must be *made* with judgment and *used* with judgment.....

THE same journal says that fat calves and fat heifers rarely develop into good dairy cows. Moderation is the golden rule. The calf, for a milch cow should never be allowed to lose ground, but it should not be allowed to become fat.....

THE American Garden knows of a man in a New York town who makes a handsome income by buying rough and unattractive house-lots, staking out the outline of a house, and then making a neat lawn of the rest of the lot, with shrubbery and flower beds in proper order. Then the lot is ready for sale at a large advance on its first cost, the lawn being the sole cause of the increased value, and its own advertisement.....

MR. J. T. LOVETT finds the Springfield (cap raspberry practically the same as, if not indentical with the old Davidson's Thornless..

THERE is a class of people, Mr. Hersey says in the Ploughman, who make farming a side issue, getting their bread and butter from some other occupation, who make themselves ridiculous in the eyes of those who are thoughtful tillers of the soil by trying to convince the public of the great profits of farmming and by extravagant statements generally. Well, to show how ridiculous this appears to the farmer, let us suppose that a few hundred well educated farmers, who for recreation, dabble a little in medicine, and doctor their sick neighbors, should also take up the pen to write for medical journals, instructing physicians how to treat diseases, and showing in columns of figures the great profits of the business, giving the exact details as to how many visits, at two dollars each, a good smart physician can make in a day, how many in a year, and what would be the profits at the end of five years. Would any real practicing physician thank such men? Would they feel that their condition was being improved by such writers?..... .....

THE man who thinks he can run successfully some professional business, and at the same time run a farm so much better than others as to enable him to become a public teacher, deceives himself, for if he gives his attention to the farm sufficiently to keep in the front ranks of progress, his professional business must suffer, just the same as a farmer's business would suffer if he should devote a considerable portion of his time to the practice of medicine, law, or mechanics..... .....

MAJOR ALVORD mentions that a cow years ago was considered good that gave 6,000 pounds of milk in a year. Nowadays cows giving 10,000 pounds a year are not uncommon. He has lately been watching a cow whose milk record was 26,000 pounds of milk in a year.....

"POTATOES will be raised, in the future, in large tracts more and more," says T. B. Terry in the Ohio Farmer. "There are men this year who have hundreds of acres. With the smoothing harrow and planter and digger, and other tools, they can handle such large fields without any trouble. Particularly is this true on the mellow soil of the West. Now whether this is wise or not, it will be done, and the railroads will move the potatoes to city markets at low figures. Machinery has enabled the big farmers of the West to make wheat almost a drug. If it wasn't for the twine-binder wheat would bring $1 to-day, Mr. Terry thinks. Look at the low price of Timothy seed. It is raised by the thousands of acres on some farms, and harvested with binder and thrashed with huge steam thrashers. So tools will work a revolution in potato raising. Unless a farmer can raise enough to afford the tools, his profit will soon be about the same that it is on 75-cent wheat."..... .....

KEEP seed-corn, squashes, tube-rose bulbs, canna roots in warm, dry places.....

PUCK thinks that the city out-countries the country. The countryman sends to the city to buy his trees and feeds his squirrel on nuts bought in the city. If you want fresh eggs or fresh vegetables the city is the place to get them. You can get a stronger dose of malaria in Central Park in a week than you can get in the country in a year. You can get sweeter and lovelier roses in any florist's shop in the city than ever grew in the country. No one thinks of buying meat in the country because country meat is not good. Even country sausages are made in the city.. ....

EDITOR CHEEVER says, in the N. E. Farmer, that a market garden makes a most excellent school for a family of growing children. They can all help earn their living and at the same time acquire ideas of manly and womanly independence, that will aid them in after life whatever occupation or profession they may follow.....

MR. O. S, BLISS says, in the N. Y. Tribune, that he keeps but one Leghorn cock to 36 or even 40 hens. In May last he set 65 eggs and 57 hatched.....

WHEN the editor of the Garden, Mr. E. H. Libby, visited Dr. Jabez Fisher's vineyard, recently, he specially noticed the thrift of the vines, their freedom from disease and the high quality of the fruit. Dr. Fisher attributes this result largely to the fact that he now uses only chemical fertilizers, which supply all the food of every sort that the vines need for the varied wants of stem, leaf and fruit. In the former use of stable manures, Dr. Fisher found that they produced strong vines, with but little fruit, and that rust and mildew were common.....

AT the London Dairy Show a class was

made for butter from cows feed on silage alone. The prize went to cows fed on a daily ration of 50 pounds of rye silage. Other prizes were offered for ornamental designs in butter; also for modeling in flowers.....

Everywhere.

Colorado.

MONTROSE, Montrose Co., Oct. 18.—Everything is grown here by irrigation, and although crops are lighter than ever before in this valley, there will be a very fair average, excepting potatoes, which are only one-half a crop, but of extra quality. Prices are only fair: wheat, per 100 pounds, $1.50, oats and barley, $1.90; potatoes, $1. N. N. J.

Illinois.

CHICAGO, Cook Co., October 26.—No general break-up as yet in the beautiful seasonable weather which October has so far given us. It might have sent us a little more rain in Southern Ohio, Indiana and Tennessee for the newly sown wheat, as already complaints are coming in that the ground is getting too dry for the newly sown crop. In Dakota and Northern Minnesota fall plowing goes on steadily, but under difficulties. Much stubble land will lie over, and there has been but little breaking up this Summer. In Stanton, Kidder and Burleigh Counties, along the line of the Northern Pacific, less than two inches of rain have fallen since harvest and not a thorough wetting in over twelve months. All surplus wheat beyond seed is moving out as soon as thrashed, and farmers accept fifty cents as readily as though that was a boom figure. I have as yet no hard frosts to report, with a week of very mild weather up to Monday night. The corn is drying out slowly. With the absence of frost there does not seem to be any desire on the part of farmers to gather the crop, and dealers are not anxious to take hold of it while it is as green as now. Millers are reporting a very excellent and in fact heavy demand for mill feed. I think this goes to show conclusively that neither the corn nor the oat crop is as large as is generally supposed. Another fact which confirms this statement is that the cribbed corn at railroad stations is yet in large supply. Farmers and grain dealers continue to report that the standing corn is in very poor condition for a wet Fall. Hog cholera does not seem to be very prevalent this Fall except in some counties in Southern Ohio and Indiana, and no matter how fatal and widespread the disease may be, the area of our country is so great that it actually seems to make very little difference at the end of the season, in the number of hogs which are packed, whether we have had any disease or not. Farmers this Fall seem inclined now to fatten their hogs as early as possible and get them into market irrespective of prices. There never has been a season when farmers have taken prices so freely as they have this Fall, rather than to wait for an advance. R. N.

Montana.

FRIDLEY, Gallatin Co., Oct. 15.—The crops in this county are all gathered in and no one seems to complain of the yield, and prices are good. No frost yet. Tomatoes not hurt yet. Onions are one of the best paying crops here; they are never less than three cents per pound, and generally five cents, and we raise as nice, large ones as I ever saw. Potatoes this year run about 200 bushels to the acre, and bring 75 cents per bushel. Oats and wheat are selling at 1½ cent per pound. We have the finest kind of land here for all kinds of farming purposes, and the very best of spring water. One of the best locations for a creamery that I know of would be here in the vicinity where I am. Plenty of fine pasture, and nearly double prices of Eastern markets for butter and cheese. I suppose some time some one will go into it—there is a fortune in the business in a short time. Butter from a good-sized creamery can be sold at an average of 35 cents for the entire season right here. Vegetables of all kinds bring good prices and ready cash sale, and plenty of places can be got reasonably for such business. The ranchmen as a rule don't pay much attention to anything else than looking after increase in their herds of cattle and horses. B. P. VAN H.

New York.

JAMESTOWN, Chautauqua Co., N. Y., October 25.—The grape season on the Lake Shore region in this county has about closed and plethoric pocketbooks attest that it has been a very profitable one to the growers. While the south shore of Lake Erie rises into hills a few miles back from the water, the most of the way from Buffalo to Cleveland, the locality which receives especial attention from viniculturists is mainly in the town of Portland, in this county, the railroad shipping station of which is Brocton, on the Lake Shore and Michigan Southern and Nickel Plate Railways. From some unaccountable reason grapes are said to grow larger and to attain a greater degree of richness of flavor in that vicinity than elsewhere along the Lake Shore, and land owners are taking full advantage of that fact, for where a few years ago one could purchase farm lands at $50 per acre the figure is now three or four times that price. In 1885 a very profitable season was experienced, the bearing being exceedingly large and the market ready and at good prices. But the season just closing has exceeded anything ever known. From Brocton alone considerably over 200 cars have been loaded with grapes and sent East and West, New York, Chicago and St. Louis taking the bulk of the crop, which will net the grape growers of the town of Portland between $100,000 and $200,000 in addition to the receipts from the sales to the immense wine houses at Brocton and to peddlers who take them inland. The Concord grape is the staple, while the Delaware, Pocklington, and especially the Niagara, are the choicest and hightest priced varieties. About three cents a pound is the average price which the growers receive, and so profitable is the industry that last Fall the acreage devoted to grapes in Portland was doubled, and the ratio promises to be even greater this year before Winter sets in. The contrast between the prosperity of the grape-growers on the shores of Lake Erie and the dairy farmers of the central and southern portions of Chautauqua County is very marked and not altogether agreeable for the latter to contemplate. Should there be several successive good seasons the lake shore portion of the county will become immensely valuable as the center of the grape-growing interests, and nearly every acre will be set out to vines. L. M. K.

UTICA, Oneida Co., Oct. 25.—There was a fairly active cheese market opened to-day, with sales much smaller, ruling the same as last week. The sales amounted to 8,529 boxes, ruling at 10⅞ cents, as follows: 3,006 boxes at 10⅞ cents; 1,026 boxes at 11 cents; 328 boxes at 11⅛ cents; 1,123 boxes at 11¼ cents; 867 boxes at 11⅜ cents; 1,087 boxes at 11½ cents; 410 boxes on private terms, and 692 boxes on commission. It is probable that the next Board will show a slight falling off. Little Falls sold 6,115 boxes cream and 945 boxes dairy—total, 7,060 boxes, ruling at 11 cents. There is a fairly good demand for best dairy. The butter market is falling and the make is becoming poorer, as the pastures have thinned out, and in some places have been frosted. There is plenty of medium butter for sale, but buyers are shy, and while the prices are nominally the same, the bottom has fallen out. Really first-class, however, readily commands more than quotations, and there is considerable of this laid down. Only 110 packages reached this market last week; the dairy selling for 22 to 24 cents, and creamery at 25 to 28 cents Little Falls to-day sold 90 packages dairy and four packages creamery at these quotations; bulk at 22 cents and 25 cents. Nothing new in hops, and everybody waiting for something to turn up. Dealers do not feel like moving under present circumstances, and there is general apathy. Prices are therefore nominal. Old dealers say they will do nothing at present, in fact, cannot. Commissioner Coleman announces his intention to thoroughly investigate the hop pest in this section. Reports of unusually fine hop crops in Oregon and Washington Territory tend to make buyers reluctant to invest at present prices here; and high prices cause the use of many adulterating substitutes in beer-making. ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper

KINDS OF DUCKS; AILING CHICKS.

W. A. L., Kingville, S. C.—1. What is the difference between common ducks and "ring ducks"—the latter, I think, are called Rouens. Don't both kinds lay light, greenish-blue eggs? 2. What kind of a duck is the Avery? Have canvas-back ducks ever been domesticated? 4. The combs, ear-lobes and gills of my chicks are sore and festered, and their eyes are watery. They eat well, but move about sluggishly and look drooping; what ails them?

ANSWERED BY H. HALES.

The domestic duck in all its varieties, except the Muscovy, which is another species, is bred from the mallard (Anas boschas) which in its wild state inhabits all the wild parts of the Northern Hemisphere and northward to the arctic regions; on our continent from Mexico northward. In Europe, when not disturbed, they become very tame, coming to a call to be fed by a person who regularly feeds them. In Aberdeenshire, Scotland, hundreds live on a mill-dam and are so fed. From some other places similar instances are reported. The Rouen duck is nearer in color to the wild mallard than other domestic ducks, having the white ring on the neck more perfect than that on the others. The superior size has been gained by selection and feeding. The white ring is not as well preserved in many tame ducks as in the wild ones. There is a variety of wild sea duck known as the ring-necked duck (Fulix collaris) which has a tufted head, which with the upper neck is greenish-black, with purple reflections. On the neck is a brownish-red ring, widest in front. It is met with along the upper coast and in the interior. It swims, dives and flies well: and its flesh is said to be excellent. Eggs of all the varieties of the domestic species are bluish-green; but in the white varieties some of the eggs are nearly white, especially the last eggs of a clutch. 2. I know of no duck called Avery. 3. The Canvas-back duck (Aythyta vallisneria) is entirely a North American species, breeding principally from Oregon north to the Yukon River, and the lakes and rivers of the fur country. I never heard of any being bred in domestication; such a case is highly improbable, as they are wilder in their nature than the mallard. In Winter they migrate as far South as Central America. 4. I suspect the chickens are suffering from small ticks, which, in the Southern States, attach themselves and burrow into the combs and exposed skin of the head; or the trouble may be chicken pox, in which case the scabs are first small and whitish, enlarging all over the comb and head, closing the eyes. The description of the trouble is not clear enough for me to judge. If the first, anoint the head with carbolic salve (carbolic acid and lard). If the latter, kill off every affected chicken; for the disease is highly infectious.

PREPARATION FOR GRAPE-VINE POSTS; MUCH ABOUT THE JAPAN CHESTNUT.

F. A., Jefferson, N. J.—1. Is pulverized charcoal boiled in linseed oil a good preparation for grape posts; and how should it be fixed? 2. How near together should Japan chestnuts be planted; that is, how large do they grow? 3. What is the earliest-ripening, grafted, reliable variety, and how large are the nuts? 4. Will it do to top-work sapling chestnut trees? 5. Would it be better to chop them down and graft the suckers on land that has never been cleared, or would it be advisable to let the American chestnut grow?

ANS.—1. We think coal tar or roofing pitch would be better and cheaper than the charcoal and linseed oil. The best of all are cedar or locust posts. 2. So far as known the Japan nuts in this country are of dwarf habit as compared with our native kinds, and may be planted like cherry or pear trees, say, 20 feet apart. 3. The trees propagated in this country are seedlings, and, like other seedling fruits, differ greatly. Care is being taken to graft from the best, though nothing entirely reliable is on the market as yet, as the first graftings were of a mixed lot, and it will take time to ascertain which are most worthy to propagate from. 4. The trees seem to be of species or varieties sufficiently different to make grafting not very easy, like apple and pear worked together. Cleft grafting on large stocks has not been very successful, as the wound seems difficult to heal often forming a sort of callus, the graft growing for several years and finally blowing out. A friend who has had much experience, always succeeds best in splice grafting with cion and stock nearly equal in size, and they must be cut very smooth and fit well, and be well covered with wax, and even then there will be many failures. The best way of all is to graft the roots of one-year-old trees. 5. It might do to try in some-years'-old suckers; but let only one or two grow at a stump. 6. For timber, the American grows very rapidly; but it may be many years before it fruits. Then, too, comes the seedling problem: some will bear when 10 or 15, others not until they are 30 or 40 years old.

SQUANTUM AND POTTER'S EXCELSIOR SWEET CORN, etc.

A. A., Holyoke, Mass.—1. In a late RURAL a correspondent says the Squantum and Potter's Excelsior sweet corns are the same; why then, does Gregory catalogue both kinds? 2. Is the Optimus Tomato as smooth as the Favorite? 3. Which sweet corn is the best for market?

ANS.—Squantum was introduced about three years ago. The ears average six inches long, about two inches in diameter at the butt tapering to the tip. Rows variable—from 10 to 18. Kernels large. Plant about the hight of Concord. It bears its ears low. Potter's Excelsior was introduced eight years ago. The rows are often so irregular that they can not be traced. The ears average shorter than those of the Squantum and taper less towards the tips; rows less variable as to number; kernels not quite so large. Plants about the same size and habit. The above and Concord grow to just about the same hight and mature about the same time. Evergreen is a taller plant and bears its ears higher. 2. The Optimus Tomato is fully as smooth as the Favorite, and is more solid and a better keeper with us. 3. Our choice of the varieties of sweet corn mentioned would be Excelsior for intermediate and Evergreen for late.

FUTURE PRICES OF POTATOES AND OTHER CROPS.

L. D. (no address).—What are the prospects for higher prices for potatoes?

ANS.—The only basis on which we or anybody else can form a reasonable estimate with regard to the future price of any product is an approximate knowledge of the probable yield thereof, and demand therefor. With regard to any crop the surplus of which is marketed in other countries where there is a competition with similar surpluses from other nations, we must have a pretty accurate knowledge of the yield not only at home, but in all other competing countries also, including that in which our market lies, before we can make even a good guess at the future prices. Potatoes are so bulky in comparison with their price, that it will not pay to export them to Europe, except, perhaps, from the Atlantic States when they have a large surplus, while there is a great shortage across the water, so that while prices are unusually low here, they are unusually high there. The great comparative expense of transportation to which this is due, also prevents us from supplying the shortage in one section at home from the surplus of any other section, if the two are far distant from each other. Thus if New York had a very abundant potato crop and Kansas a very scanty one, the shortage there could hardly be made good from the overabundance here. Prices, therefore, might be high in Kansas and very low in New York at the same time. The difficulty would be less where the price of the product is higher in comparison with the cost of transportation, as in the case of wheat or flaxseed; and greater where the price is lower in comparison with the freightage, as in the case of pumpkins or watermelons. With our present knowledge of the crop hereabouts we do not think that the price of potatoes will rise enough to compensate for shrinkage, rot and interest; but the case may be different in some other sections, and we do not know where our correspondent lives. Great care is taken to collect all attainable information with regard to crops at home and abroad, and condense it every week under the caption "Crops and Markets." If our friends will read that Department carefully every week, they will be able to form a very fair idea of the yield of the various crops not only in the whole country, but also in the different parts of it, and in the rest of the world, and in this way be in a position to form a pretty correct idea of what prices will probably be.

FRUIT QUERIES.

"Amateur," Delaware Co., O.—1. What apples are likely to succeed in Central Ohio, hardiness of tree and quality of fruit to be also taken into consideration? 2. What about Jonathan, Pewaukee, Sops of Wine, Wealthy and Yellow Transparent? 3. What are half a dozen of the hardiest peaches? 3. What about the Kilbourne Ironclad Peach? 5. Will the grafting of cions from two-year-old apple trees into bearing trees hasten their bearing? 6. In Spring can the tops of small trees be grafted at the same time the trees are transplanted?

ANS.—Belmont, Ben Davis, Grimes's Golden, Peck's Pleasant (Winter); Rambo (late Autumn); Red Astrachan (Summer); Red Canada (Winter); R. I. Greening (Winter); Rome Beauty (late Autumn); Summer Queen (Summer). To these we could add many that succeed in many localities in the State; but the above are those that succeed generally. Baldwin, Bullock's Pippin, Early Joe, Early Strawberry, Esopus Spitzenberg, Fameuse, Garden Royal, Gravenstein, Jefferis, Melon, Mother, Newtown Pippin, Northern Spy, Rawle's Genet, Primate, Porter, Summer Rose, Swaar, Wagener, Westfield, Seek-no-further—all of which are of the best quality, thrive well in some parts of Ohio. 2. The Jonathan is a very good winter apple of medium size. It is an American apple suitable for family or market. The Pewaukee is a large American winter apple of fair quality only. Sops of Wine, medium size, fair quality, early Autumn. Wealthy is of medium size, very good quality—Winter—American. The Yellow Transparent is of Russian origin, medium size, fair quality, early Summer. Alexander is a Rus-

sian of fair quality, large, ripens in Autumn. 3. Oldmixon Free, Stump the World, Red-cheek Melocoton, Royal George, Crawford's Early and Crawford's Late, George the Fourth and Grosse Miguonne. 4. No. 5. Yes. 6 It would not do.

LAMPAS; INTESTINAL WORMS IN A HORSE.

A. H. G., Lawrence, Kans.—My seven-year-old horse and two-year-old colt are troubled with lampas, swelled gums and itching tails. Both are in good condition, but are uneasy and disposed to rub against the fence or stable. The horse often has small boils where the harness presses and under the collar; what should be done?

ANSWERED BY F. L. KILBORN.

"Lampas" is a symptom of digestive or other disorder, or is due to local irritation, as from teething or injuries, and is not a disease of itself. In the old horse it is evidently due to digestive disorder caused by intestinal worms. With the young animal it may be due in part to the same general cause or entirely to dentition. In either case the old custom of burning out should be condemned as barbarous and unnecessary. The congestion, if severe, may be temporarily relieved by slight bleeding with the knife between the front teeth and the third wrinkle. For young, healthy animals nothing more should be required, and the "lampas" will disappear after the eruption of the permanent teeth. Feeding dry, hard corn in the ear is often practised with benefit. For the intestinal worms in the horse give five drams Barbadoes aloes; the following morning before feeding give two drams tartar emetic and one dram each carbolic acid and sulphate of iron, and continue for six consecutive mornings; on the seventh day give a second dose of the aloes, varying the size of the dose either more or less according to the action produced by the first dose. Injections of several quarts of a strong solution of quassia will be useful in removing the worms in the lower colon and rectum. If worms are suspected in the young animals, the two-year-old may receive one-half, and the spring colt one-eighth of the above dose. Following the above treatment, half an ounce each of gertian, ginger and sodium carbonate in the evening, and two drams each niter, aloes, and sulphate of iron in the morning, continued for two or three weeks, will aid in bringing the system into a healthier condition. Thorough daily grooming will also greatly improve the condition of each.

COMBINED ICE-HOUSE AND MILK ROOM.

E. B. D., Columbus, Kans.—How would a practical dairyman build a combined ice-house and butter-making room for a dairy of 25 to 30 cows?

ANS.—A building 16 x 30 feet would be about right, and if half of it was over a cellar, all the better. In the absence of a cellar if the site is not suitable to have one, it would be well to have the building two stories in hight; the ice-house being 16 x 16 and the butter room 14 x 16. Instead of having the ice-house run from the ground to the top, we would have a cold store-room, with ice above it. The ceiling of the cold store-room should be inclined and made of galvanized iron, water-tight. Fill with ice above, to the roof, and have the sides and roof built in modern ice-house style—three thicknesses of ceiling and paper with two air spaces. So built, little or no saw-dust packing is needed, so the ice is quite clean for butter making. The cold store-room is needed to hold and keep the butter cold for a short time till sale-day. The butter making room, 14 x 16 feet, is large enough for the creamery tanks, a 100-gallon churn, the butter-worker, etc. The chimney for the make-room should be put as far from the ice-room as possible. This would leave a room over the make-room; but such a room never is empty on a farm. The room would be large enough so that the herd of cows might be enlarged to 50 or 60 and still have space enough, while to make it smaller would be a mistake, because there would not be passage-way between the tools that must be used. The ceiling of the cold store-room should be made to incline towards one side of the building so that the drip of the ice could be used in the creaming tank, and so much anti-caloric saved. This could easily be done by having the cross joists put higher upon the studding on one side. Of course, to hold the ice safely the cross joists must be strong or supported in the center.

POULTRY RAISING.

W. P. C., Augusta, Ga.—1. In a late RURAL a correspondent, speaking of poultry raising, says: "Let a man invest $1,000 in the enterprise, and if he has any gumption whatever he can, the first year, realize six per cent. on his capital." Is there not some mistake about this? If that is the only hope a fellow would have for his money, to say nothing of the "strictest attention," "wide-awakedness," etc., etc., necessary, it is but poor encouragement. 2. What is the best incubtor?

ANSWERED BY C. S. COOPER.

1. The profits in poultry-keeping will depend entirely on the proportion of chickens a man can hatch and his success in rearing and marketing them. A novice will be always less successful in the business the first year than afterwards, especially if he enters it in a large way without any previous study or practical training. It would be always prudent before investing even $1,000 in it, to obtain some practical experience from those who have successfully handled fowls extensively. The raising of poultry in large numbers for eggs or fowls for market seems an easy business to those who have not tried it; but it is risky for a new beginner, though many who have experience make it very profitable. A good brooder is as essential as a good incubator. The Buckeye, made by the Buckeye Brooder Company, Ada, Ohio, I know to be good. Of incubators there are several good ones. I have the Perfect Hatcher, which is very good; made by Perfect Hatcher Co., Elmira N. Y.; but it is well to dispense with the clock work if one can. The Monarch, made by Jas. Rankin, South Easton, Mass.; the Thermostatic, for sale by E. S. Renwick, 19 Park Place, N. Y., the Eureka and Andrews' Hatcher I know are all good and successful machines.

KILLED BY DRINKING TOO MUCH.

J. C. K., Peru, Ind.—My eight-year-old cow dropped a calf at noon, and she and the calf appeared all right; in the evening she was given all the cold water she wanted; next morning she couldn't get up: her feet and legs were cold; she kept on getting worse and died in 48 hours after drinking the water. What was the matter?

ANS.—Probably she was killed by drinking too much cold water. A cow in her condition should have received very little, if any, cold water. She should have had water "with the chill taken off," and warm mashes given frequently in small quantities for at least 24 hours before allowing free access to cold water. There would have been little hope of a recovery with the best of treatment.

HEELING IN SMALL FRUIT VINES FOR WINTER.

W. W. T., Waterville, O.—Can plants of raspberry, blackberry, grapes, etc., be taken up in the Fall and wintered without a cellar? If so, how can it be done?

ANS.—Yes. Select a sheltered, well-drained place in the garden or anywhere. Dig a hole or trench as needed, and place the plants in it. Work the soil well in among the fibers and roots the same as in planting them. The plants may in this way be placed so near each other that the roots touch. This is called "heeling in." A slight cover of leaves or straw may be placed over the trench when the weather becomes cold. If properly done, plants treated in this way will often start earlier in the Spring than if set out now where they are to remain.

CONTAGIOUS FOOT ROT IN CATTLE.

A. G., La Center, W. T.—Last March a cow of mine became lame, but I could notice nothing the matter with the hoofs; but now there are sores between the toes. She doesn't seem to be pained much, and she travels as far every day for feed as the other cattle, and eats as fast. A calf she dropped in March is also somewhat lame, but not so badly as the dam. On the calf the sore is between the toes on the front right foot, running all the way from the front to the rear. It discharges a bad-smelling pus. The place is very raw and the discharge appears to have rotted the skin to the flesh. The cow is affected in the same way only worse. In neither case is the leg so swollen as to be noticeable. There is no sore where the hide and horn join outside the hoof. The pasture is not wet. What is the matter?

ANS.—Clean the foot and pare away all diseased horn to expose the whole diseased surface. Cauterize thoroughly with commercial hydro-chloric acid, using a cloth swab on a stick, so as to eat away all diseased tissue. Then apply a dressing of tar. Also apply a light dressing of the acid and tar to the healthy feet as a preventive. Examine the feet and dress once or twice a week until cured. The disease being contagious, all sick animals should be kept apart from the healthy until healed.

Miscellaneous.

E. W. B., Sanford, N. Y.—1. I have a sick cow and lost another by the same disease. First, the eyes run; then turn white and milky and bulge out, and in 48 hours the animal becomes blind; the nose grows sore and matter runs from it and the mouth. The animal is hot and feverish, has a good appetite, but loses flesh rapidly. The second one has been sick about a week. What is the matter? 2. Who is the N. Y. State Veterinarian?

ANS.—The symptoms are unsatisfactory; but if the cattle had access to low, damp, marshy places, or were otherwise exposed, it is probably malignant catarrh. If this is the case, treatment is not very satisfactory, except at the very outset. Better to prevent the disease by removing the cattle from such localities, and protect from exposure. 2. Dr. James Law, Cornell University, Ithaca, N. Y.

R. A. B., Monroeville, N. J.—For six weeks my two-months-old colt has stepped on the toe of the left fore-foot, and "crinkled" forward in walking. It is lamer sometimes than at others. On examination I can't see what is the trouble; can the RURAL? 2. The two teats on the right side of a Jersey calf are fastened together just by connecting skin; could a surgeon separate them?

ANS.—1. We suspect the back tendons are too short and require cutting across, an operation requiring the services of a competent veterinary surgeon. If our diagnois is correct all other treatment will be useless. 2. Yes; any good surgeon can safely separate the teats.

W. M. K., Washington, D. C.—1. My cow's teats keep very sore all the time, though I grease them after milking; what is a remedy? 2. Would it do to put crude petroleum on hens under the feathers, to get rid of vermin?

ANS.—1. What is the nature of the sores? As to the cause, you give us no clue in your brief description. Try cauterizing the sores with a stick of nitrate of silver, after which apply daily an ointment of equal parts of spermaceti and almond oil. The teats must be kept dry and milked carefully. If milking by hand appears to irritate the sores so as to prevent healing, it may be necessary to use milking tubes until healed. 2. Yes; in small quantities. But it must be used cautiously.

S. S. S., Dover, Del.—My young horse chews up all the harness he can get hold of; what is the cause and what a remedy?

ANS.—Either a habit, occasionally contracted by young horses from pure wantonness when idle, or a depraved appetite. In the first case, the very simple remedy is to give the horse something else to do, so that he will have less time for such practice, and to keep the harness out of his reach when necessarily idle. If due to a depraved appetite, the animal is out of condition and needs a course of treatment. But if such is needed we should have a careful description of the case to enable us to prescribe.

J. K. P. A.—(*address mislaid*)—Can I get a cheap mill for grinding corn meal or Graham for table use?

ANS.—The Frank Wilson No. 0. mill will do good work. We have examined a specimen of Graham flour made in this mill; it is excellent. Price $5. Wilson Bros. Easton Pa.

T. B. H., Wellsville, Pa.—The tree is evidently a seedling. Oftentimes seedling pears and apples do not blossom or fruit in many years. The pear will grow on the apple—the apple on the pear. But usually they will be short-lived.

H. G., Hamburg, Conn.—Is it advisable to plant potato onion setts in the Fall? 2. In what proportion should kainit and raw bone be mixed for application to plum trees, and, 3, how much of each should be applied to trees planted two years ago next Spring, now in thrifty condition?

ANS.—1. No—in the Spring. 2. This can not be answered because we do not know whether your land most needs phosphoric acid or potash. We should advise using one bag (200 pounds) of kainit to one bag of bone. 3. The trees being thrifty, apply not over at the rate of 800 pounds of the combined fertilizer to the acre. This would give a couple of heaping handsful to each tree.

DISCUSSION.

AGRICULTURAL COLLEGES AND AGRICULTURAL EDUCATION.

L. E. B., LINCOLN, NEBRASKA.—The RURAL advises farmers to stop nagging at the agricultural colleges and to support them by sending their children. Such advice should not pass without comment. If it is supposed that the attendance at one of the agricultural colleges necessarily means that one will get a farm education there, I must object to the RURAL'S advice. It is well known that a large part of the income from the agricultural college endowment is used to educate anything but a farm spirit. Those who want their boys to become farmers find little inducement held out by these schools. Before the college course is over it is a fair chance that their boys will be led into some other field of thought. While this uncertainty exists these schools cannot ask the support of earnest farmers, and it is no wonder that they are reticent and inclined to ask "leading questions." We know that but very little successful work in agricultural education has been done in this country. This is not from lack of opportunity, but from lack of men who have the work at heart and are trained for it, and can carry interest and enthusiasm into earnest effort. I write this after some experience in farm school work. I know that farmers are awake to their best interests in educational matters, and do not think they deserve the scolding the RURAL gave them.

R. N.-Y.—The RURAL'S opinion is that the farmers of the country have the power to make a grand success of a majority of our agricultural colleges. This opinion is based upon a personal examination of two of the most successful institutions and a study of several feebler ones. In Michigan, Mississippi and Kansas we have agricultural schools that offer no apology for existing, and are not ashamed to place their course of instruction beside that of any school. The progressive farmers of Michigan made their college by sending their boys there and keeping them there. If in the beginning they had hung back and sneered at the school and sent their boys to sectarian colleges, the institution would long since have been swallowed up. There is an enthusiasm about numbers that counts in colleges as in any other place where men meet. Surely if Michigan, 30 years ago, could find men to start her college, other States can get them to-day if they care to look for them. If the farmers do not believe that agricultural education is possible, and that their boys can make better men by learning poor Latin and worse Greek at a second-rate college than they can at any possible agricultural college, that is their own affair. We believe, 1, that it is possible to create, in every State in this country, an agricultural college that will be a positive benefit to the State; 2, that the farmers of any State have the power to make or unmake these colleges just as they wish. The history of the half-dozen colleges that can be rated as anything of a success will prove these propositions. Let the farmers' organizations of any State all pledge themselves to give their agricultural college their warm and hearty support for five years. Let them send boys there as students and committees there to investigate, and keep up the work honestly and fairly and the result would astonish them. You will say you do not care to experiment with your boy's education. What else do you do when you send him to any other college? Can you tell what he will make as the result of his college training? One favorite argument of farm writers is to the effect that farmers' boys should never be surrounded by any education or influence that would draw them away from the farm. There is far more sense in permitting a boy to select his own profession. He will be a happier and a better and more successful man for such a selection. There are natural farmers, natural doctors and natural lawyers. They are frequently found in the same family. Give them special training and you make three good men; give them all the same training and you make three second-rate men. We have normal schools for teachers, special schools for lawyers and doctors—we need them for farmers. We can have them when we send our genuine farm boys together. They will make the institution and give it dignity.

Purify the Blood.

We do not claim that Hood's Sarsaparilla is the only medicine deserving public confidence, but we believe that to purify the blood, to restore and renovate the whole system, it is absolutely unequalled. The influence of the blood upon the health cannot be over-estimated. If it becomes contaminated, the train of consequences by which the health is undermined is immeasurable. Loss of Appetite, Low Spirits, Headache, Dyspepsia, Debility, Nervousness and other "little (?) ailments" are the premonitions of more serious and often fatal results. Try

NEW STAMPING OUTFIT FREE!

The Fireside at Home is a mammoth 16-page, 64-column *Illustrated* Literary and Family paper, filled with the most interesting and instructive reading matter for all. Its publishers, wishing to introduce it into thousands of homes where it is not already taken, now make the following *unprecedented offer: Upon receipt of only* **Twenty-Five Cents**, *we will send* **The Fireside at Home** *for* **Three Months**, *and to every subscriber we will also send* **Free** *and post-paid, a new and valuable* **Stamping Outfit**, containing the following patterns: 1 set Initials, 1½ in. high, 1 Dancing Girl, 9 in. high, 1 drooping Bay, 1 in. high, 1 spray Daisies, 5 in. high, 1 bunch Roses, 4½ in. high, 1 cluster Apple Blossoms, 3 x 4 in., 1 Owl on branch, 4½ in. high, 1 bunch Peaches, 1 cluster Daisies, 1 spray Wheat, 1 spray Morning Glories, 1 Calla Lily, 1 bunch Forget-Me-Nots, 1 Rosebud with leaves, 1 spray Pansies, 1 spray Bachelor's Button with grasses, 1 Pink, 1 Day Lily with bud and foliage, 1 spray Vinca, 1 bunch Daisies, 1 Japonica Bud with leaves, 1 Fat Boy (comic), 1 cluster Forget-Me-Nots, 1 Pansy, 1 spray Daisies, 1 Star Flower, 1 spray Spanish Rose, 1 Outline Design, 1 Vine, 4 patterns for flannel embroidery and 3 smaller designs for Crazy Patchwork, making in all 35 Elegant Patterns, worth at retail from 5 to 20 cents each, and 1 Complete Alphabet worth 25 cents, also 1 box best Powder, 15c., 1 Improved Distributor, 10c., and 1 Complete Book of Instructions, 15c. Remember, we give the entire Outfit described above *free* to every one sending 25 cents for a three-months' subscription to our paper. This Outfit is entirely new, has never been offered before in any way, and must not be confounded with the cheap catchpenny affairs advertised by others. Five subscriptions and five Outfits will be sent for $1.00. Do not miss this chance! *Satisfaction guaranteed.* As to our reliability, we refer to any publisher in N. Y. Address,

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, NOVEMBER 6, 1886.

We want a complete volume of the Rural New-Yorker for 1883, bound or unbound. We also want copies of the issues of July 3 and 31, 1886. Those having these numbers to dispose of will oblige us by notifying us at once.

We are now about to give up our Wyandottes, having tried them for three years, and told our readers all we know of them. Our conclusion is that they are a first-rate all-purpose fowl—as good as any. The only fault we have to find is that their eggs are rather small. We have now the Langshans to try next. We endeavored to procure a stock from eggs last year but failed.

While we are reforming the nomenclature of fruit names, it would be well to make a change in the words "basin" and "cavity" as applied respectively to the depression about the calyx and stem. There is nothing about these words to impress them upon the memory. We would suggest the words "stem basin" and "calyx basin," or "stem cavity" and "calyx cavity." These terms would be understood by all and need no fixing in the memory.

Thirty-two carp were put in the little lake at the Rural Grounds nearly three years ago. They varied in size from two to five inches in length. That was the last of them so far as we know. The lake is about 150 by 100 feet in area, occupying a natural basin, and averages four feet deep. It is fed by many springs that never fail, and the excess of water flows over a dam five feet high and thence by a circuitous route to the Hackensack River four miles distant.

At the late convention of the Knights of Labor at Richmond a resolution was passed, on October 18, to appoint a committee "to promote fraternal relations between the Knights and the Patrons of Husbandry." There is no reason why a very friendly feeling should not exist between the workers in the shop, road and factory and those on the farm. The object of both classes is the same—to obtain for their own benefit a juster proportion of the proceeds of their own labor.

The time is now coming when we may expect to hear fresh account of deaths from trichinosis. The season for extensive pork eating is now at hand. It appears that there are far more cases of trichinosis than people imagine. The disease is not always fatal. Many cases of so-called typhoid fever, rheumatism or diarrhea are really due to this disease. Cases of a general attack of bowel complaint among the company at picnics or other gatherings, have been traced to the serving of large quantities of underdone ham. There is only one safe way to serve pork, and that is to cook it thoroughly.

In this State we have a law which forbids the killing of of "any wild bird other than a game bird," and, furthermore, it is provided that no one shall "purchase or have in possession or expose for sale any such song or wild birds or any part thereof, after the same has been killed." This law applies not only to the man who offers song birds or any part of them for sale, but also to the woman who wears them. It is now in force. There isn't a milliner's store in this city or in any other town in the State where it isn't violated. Lawbreakers are met with on every street in this and other towns in the State. Wouldn't it be well to make some attempt to enforce the law and put an end to an infamous business?

The Ear-leaved Magnolia, M. auriculata of some, M. Fraseri of Gray, does not seem to be well known though far better suited to small grounds than the Cucumber Tree, M. acuminata. It is very hardy at the Rural Grounds and bears two crops of its yellow blossoms every season—one in May the other in September. It does not grow so tall as the Cucumber Magnolia, while the leaves are as large and the habit more compact. Another item in its favor is that it retains its leaves fresh and green for two weeks or more after frost, while those of the Cucumber Tree are blackened by the first frosts. The hardy magnolias are not half appreciated as ornamental trees. They should be transplanted in Spring.

The North Jersey Water Company proposes to supply pure water to the cities and towns in the Passaic and Hackensack Valleys. The design is to secure possession of the range of hills running through Northern New Jersey. In these hills it is proposed to construct reservoirs in which the water from springs and brooks can be stored. The great elevation of these natural reservoirs will easily enable the projectors to force water into any part of the large cities between the hills and the river. Much of the water used in these cities is at present indescribably filthy. About Paterson the river is simply blue, yet human beings are expected to drink it. The village sewage, cesspools and privies all add their quota of disease to the supply of drinking water. The sending of pure spring water into these cities will be an inestimable boon.

There is no fouler blot on the face of our country to-day than the grog shop. Honest men who love their homes should hate the saloon as they hate a loathsome disease. There is no reason why the rumseller should be regarded by honest men as any better than a criminal. The temperance movement in this country will make wonderful progress when the rumseller is placed just where he belongs in the estimation of respectable people. The saloon has no respectability because it works only to destroy the elements of self-respect. It replaces hope with despair, kills courage, dims manhood, and ruins health. It has no right to the respect of man, and he who gives it even the encouragement of silence is an enemy of morality. See to it that no son or daughter of yours can ever learn from you that the saloon is entitled to anything but their abhorrence.

There is a great deal of discussion in the South with regard to reducing the cost of growing and handling cotton. It is insisted that the cost of growing and spinning can both be reduced, and that the changes possible would make cotton growing as profitable as it was before the war. It is proposed, in the first place, to save one cent a pound by doing less work with the hoe and more with the cultivator. With the new cotton-picking machine, which, it is claimed, is nearly perfected, a saving of a cent and a half a pound can be made in gathering. Then it is proposed to have spinning mills alongside the cotton fields. The following calculation is made: Cost of cultivating and gathering, 4½c.; cost of spinning, 2c.; total 6½c. per pound; sale of yarn, 14c. This leaves the grower 7½c. per pound after all expenses are paid. If the cost of transporting the raw material to the mills of New England and Europe can be saved, the planter, of course, will be the gainer.

The Supreme Court of the United States, in the case of the Wabash, St. Louis and Pacific Railroad *vs.* the State of Illinois, has just rendered a decision which is of great importance to the public. A State law forbids discrimination against persons or places in railroad charges, and the State Courts had decided that the law applied to rates charged on shipments from points inside the State to points outside it. A test case was taken to the United States Supreme Court which has just decided that legislation by any State against discrimination in rates applied to transportation which is continuous over several States, including the one whose lands are in question, is in contravention of the Constitution. A majority of the Court rules that such legislation is not within the province of State Legislatures; but that Congress alone has the right to pass laws regulating inter-State commerce. Chief Justice Waite and two of his associates dissented from the opinion of the majority, so that, while the principle is affirmed, there is a good deal of doubt as to its application in the particular instance before the Court. Whatever else may be the effect of this decision, it ought to insure the prompt passage of either the Reagan or Collum inter-State commerce bill, which the railroad agents in the last Congress managed to shelve.

"Self help is the remedy for all evils of which men complain." So said Abram S. Hewitt in a recent speech. No truer words ever came out of the mouth of man. There is a fair chance for every man in this country. Every man who makes an honest effort to help himself will be helped, and all cowards who fall back at the first obstacle will be cursed. The stern justice that makes this decree cannot be moved to change it. Every self-made man has the same story to tell. He can point to times in his life where had he given up and called for help, he would have ended his life dependent instead of independent. Instead of giving up he pushed on, helped himself and made a way. He found that every self-denial made the next one easier, that every determination not to give up, added just so much strength to his character. All this has been proved true time after time. The young men of this country should understand that it lies in the possibilities of every healthy man's life to make of himself just what he will. There is another thing to be considered. Excellence in any line of work is simply the representative of so much self-denial, so much energy and solid work. This has been said over and over again, but it is true every time it is said.

THE KIEFFER ON LONG ISLAND.

In the R. N.-Y. of August 14, page 527, is given an account of how Kieffer cions were worked on a pear tree 100 years old. The grafting was done three years ago. The grafts bore two peach-basketfuls the second year, and this year they were loaded. Mr. Augustus T. Hewlett, the owner of the tree, now (October 26) sends us 16 of these pears. They weigh four pounds 12 ounces an average of nearly five ounces each. They are mostly keg-shaped, the rest Diehl or pyriform. The color is yellow, often with a red cheek. As to quality, they were pronounced "relishable" by those who ate them. There is a sourness about them peculiar to Kieffers and hard to describe, which is agreeable to some and disliked by others. It is more the sour of some apples than the sprightliness of pears. They were very juicy, tender in some parts but for the most part coarse, with many lignine grains. It may interest many of our readers to know how the Kieffer succeeds in the sandy-loam soil of the south side (ocean) of Long Island.

THE CHICAGO MENACE.

The official report just made by Dr. Salmon, Chief of the Bureau of American Industry, with regard to the outbreak of contagious pleuro-pneumonia at Chicago, confirms all we have said on the subject. The inspection of city and suburban herds leaves no doubt that the contagion has been very widely disseminated. The existence of the disease has been known since 1884 to the owners of distillery-fed cows; but they tried to conceal its presence and to lessen the loss from it by inoculation. While this did lessen the losses, it scattered more widely the contagion. The experience of the world with this plague leaves no doubt that the only reliable way to exterminate it is to slaughter every affected animal and, as a precaution, every animal that has been exposed to contagion. In the present case, Dr. Salmon says such a measure cannot be carried out without additional legislation, both State and National. Neither the State law nor the appropriations are adequate to the emergency, and the cattle industry is declared to have "reached a crisis."

A press dispatch yesterday says the owners of quarantined cattle "continue killing their healthy animals" under the inspection of the State Veterinarian. The flesh of unsound animals is sent to the rendering tanks; while that of healthy beasts is sold in the markets. Another dispatch declares that milk from the distillery cows is constantly smuggled into the city, and that numbers of the quarantined cattle are "spirited" away every week. The cattle dealers of Chicago have done more than any other class of men to create doubt and suspicion with regard to the existence and nature of the plague, but it is very likely that the delay in suppressing it, which is largely due to their action, will entail well merited punishment upon them. But even for the satisfaction of punishing them the vast cattle interests of the country—amounting to over $1,200,000,000—should no the exposed to prolonged danger.

HELP THE GOOD WORK.

The United States Department of Agriculture is engaged in a work which, if carried out fully in the line proposed, will be of immense benefit to the cattle interest of this country generally, and to breeders of pure-blooded stock particularly. It is collecting information from which it expects to be able to present a full and accurate report showing the number of pure-bred cattle of each established breed in each county and State, and their ages and sex; the general average prices for which such cattle were sold last year; the cash values of so-called "scrub" or native cattle, and of animals sired by pure-bred bulls of the several breeds. An effort will be made to show what increase in weights of beeves resulted from the use of pure-bred bulls; also, what increase in the quantity of milk, butter or cheese produced per cow per year has resulted from the use of Ayrshire, Guernsey, Holstein-Friesian, Norfolk-Suffolk, Short-horn and Swiss bulls. The difference between the cost of beef produced by high-grade cattle and that from common native or scrub cattle, and the difference between the cost of milk, of butter and of cheese from grades and that from natives, will be shown, if possible, as will also the average duration of productive life of "scrub" cattle, and of improved cattle, the average number of calves born for each hundred pure-bred cows, each hundred grade cows, and each hundred "scrub" cows, so-called, and what percentage of these calves reach maturity. Many efforts have been made to show the value of the influence of pure blood in cattle, but they did not cover the ground fully and satisfactorily—indeed the work is of too great magnitude to be successfully done by individuals. Even the Department of Agriculture itself can not carry out the plan without the aid of the thousands of breeders who, having experience with cattle of the various kinds mentioned, and intelligence to observe and note the results of their work, are competent to give valuable evidence bearing on the subject. Prominent breeders express a very cordial appreciation of the project and a desire to see it completed at an early day. The details of the work are under the charge of Mr. E. W. Perry, 234 La Salle Street, Chicago, who has for many years been known as a student of and writer on live stock interests.

BREVITIES.

We would call the attention of our lady readers especially, to the Rural's list of book premiums, which will be presented in our supplement of the Thanksgiving Number. The terms upon which they are offered should engage the services of all.

A heavy mulch or dressing of sifted coal ashes about currant and gooseberry bushes is said by some writers to keep the currant worm away. The experiment thoroughly tried at the Rural Grounds for two years past has not had this effect. The mulched bushes were just as much infested as those not mulched.

The farm papers reiterate the perennial advice to gather the fallen leaves and add them to the manure pile. We gather most of the leaves at the Rural Grounds as much with a view of keeping the place tidy as to profit. We doubt if it pays to gather the leaves. It requires the services of a man for a day to gather enough leaves to make, when decomposed, a barrel of soil. Is the barrel of soil worth a dollar or more?

And the drought continues—the severest of this season we have ever known. The air is filled with smoke from many burning woods and meadows. It is worse than useless to plow for rye and much remains unsown. Early sown rye is burning up in places. Many of the wells in the country about the Rural Grounds in New Jersey and the Rural Farm on Long Island are dry. Later: October 27. The drought has been broken by showers.

Poultry supply a good proportion of the meat on most farmers' tables. It should supply more. We have been discussing breeds, crosses and grades of cattle and sheep, why not discuss meat poultry? What breed or what cross gives the best meat, and is there the same difference between scrub poultry and thoroughbred poultry as there is between scrub beef and thoroughbred beef? People who have looked into it say there is. If this is so, it will pay any farmer to look into it.

Well, is it satisfactory to have the question officially decided by the highest authority in the land. Webster's Unabridged, the cyclopedias and common opinion have hitherto regarded the tomato as a fruit; but the Government, through the Treasury Department, has just decided it is a "vegetable." The Collector at this port insisted on assessing duty on tomatoes as "vegetables" instead of as 'fruits," under which head importers claimed they should be assessed, and the Treasury Department has sustained the action of the Collector.

The opinion of those who examined the preserved eggs at the London Dairy show was that no plan seems superior to putting them in dry salt, without any other precaution. Strange to say, this plan was not followed by any competitor. This matter of preserved eggs is an important one. It would be a great convenience to farmers' wives if eggs could be cheaply and easily packed while they are plenty. Specimens are sent to the managers of English poultry shows 90 days before the date of the exhibition. They are kept until the opening of the show and then examined and tested. Our poultry shows should include classes for preserved eggs and dressed poultry.

Miscellaneous.

TRANSCONTINENTAL LETTERS. LXVIII.

MARY WAGER-FISHER.

Peach Spring Station; a nice breakfast; on the way to the Grand Cañon of the Colorado; Farlee, the cosmopolitan "boss"; a "tremendous ride" on a "mud wagon"; "the most marvelous road in America"; nothing overwhelmingly wonderful; a six-mile trip in the Grand Cañon.

PEACH SPRING STATION is an important point for railway trains on the Atlantic and Pacific Railroad, as it affords an unfailing supply of water of great excellence, which in Arizona, where rain does not fall sometimes for a year or more, is worth more than gold. The spring is four miles distant and the water for the town is conveyed through a pipe. Some peach trees were planted several years ago near the spring which gave it its pleasant name, and as we rode past them on our road into the Grand Cañon they were in full bloom. It was the second day of April.

Although Peach Spring is the station to alight at for the Grand Cañon, comparatively very few people have as yet stopped off to visit this unparalleled scene of desolation, where one fairly sees where the "foundations of the earth were laid." The visitors of most note have been scientific men. The railroad through here is of comparatively recent construction, and while the place has for several years been known as one of the "seven wonders" of this country, its renown is still a thing of the future as a tourists' resort. Railway folders announce it as being 18 miles from Peach Spring Station, and I have seen spirited pictures of the stage coach drawn by four horses conveying travelers from the station to the cañon. But I can only write of it as we actually found it. The station is the usual forlorn place of these arid regions—shanties planted about, saloons, maybe a land office; but here there is a tolerably good eating-house, large and airy. However, the railway officials had advised us, if we wanted a good breakfast, to go to a certain shanty where a "nice white woman" did the cooking, and served meals. Thither we went, and sat on high stools by a counter, and watched the "nice white woman" cook the breakfast over a stove on the other side of the counter. Although she fried the beefsteak in fat, we had the satisfaction of seeing that the cooking was done neatly. She gave us hot biscuits, griddle cakes, fried eggs, boiled potatoes, coffee and bread and butter at 75 cents for each of us. Every article of food was imported. We bought bread here for our lunch basket, each small loaf costing 20 cents. Two days later we breakfasted in the railway eating house, or hotel, and had an equally good meal

Meantime Anaximander had found Farlee, the proprietor of the stage coach and the road leading to the cañon, and had engaged him to take us into the cañon and bring us back to the station, and for this service we were to pay the usual charge of $10, for each person. Farlee said the distance was 23 miles; that it would take us about 3½ hours to go and six to return; that we could stay as long as we liked; that we could take our own "provender" or he would furnish our meals at 75 cents; that he had built a hotel in the cañon where we would find comfortable lodging. As Farlee was an individual character, it may be of interest to add that he had been all over the United States, had served in the war, had been in a rebel prison, had been shot and maimed, had at one time been nearly "done for" with lung trouble, but had come into the wonderful air of Arizona and was then as healthy and handsome a man as one would find in a day's travel. He went into a corral near the station and took out a pair of small horses which rejoiced in the names of Pop and Rowdy, and hitched them to a two-seated buckboard. This was the actual stage, and into it we clambered. It was without cover, the sun was hot, it was dusty for the first few miles, but the air was altogether delicious, marvelously dry and pure. It must have been the atmosphere that sustained us for the undertaking, tired as we were at the outset from loss of sleep and a fatiguing journey. I wore my gloves into tatters hanging on to the seat, and if there had been any unoccupied places I should have been bounced into them all during that tremendous ride.

Peach Spring Station is 4,890 feet above the sea level, and from there to a ridge a mile or so distant there is an ascent of 200 feet. The road from the ridge to the Colorado River level descends 3,960 feet. The road follows the bed of what is called Peach Spring Cañon, and Farlee told us that he had spent several thousand dollars in making the road traversable, and several more will be required to make it a good thoroughfare. However, Pop and Rowdy knew every inch of the way, and wormed the buckboard in and out among the rocks and boulders, and to hear Farlee screech to Rowdy for any misbehavior was equal to the scream of a steam engine. Although this road through the Peach Spring Cañon is undoubtedly the most marvelous road in America, it probably impresses no one as being such in making the descent. At all events, I was silently disappointed at not being more profoundly impressed. I remembered when I thought Watkins Glen quite a gorge, and Williams's Cañon and the Ute Pass in Colorado were not to be spoken of derisively. I knew that all the gorges I had ever seen—including the Marshall Pass which Anaximander had seen—and which a flood had prevented me from having crossed—were mere pigmies in comparison with this, still nothing was overwhelming as I expected. Some curious rock exposures rose high in the air—one was called the Great Chimney. It was 60 feet perfectly square—it looked the size of an ordinary chimney. Another point was called the Beehive. There was a great deal of trap rock in places supporting enormous layers of sandstone, the strata of which were perfectly horizontal. Everywhere cacti were growing—some in bloom—Farlee said there were 17 varieties of cactus in the cañon. A part of the way we rode through an avenue of Ocatiro (Fouquiera splendens) just bursting into bloom, and most of the flowers and shrubs were new to us. Finally we came to the "hotel" which Farlee had built with his own hands—a rude affair, but delightfully clean, and a precious haven of rest. We had dinner—Farlee was a capital cook; he had pretty decorated china and nice silver—he was tidy, deft, ingenious, a jack-at-all-trades, and good at all.

Refreshed by our meal, we set out with Farlee for guide, who took us into a tributary cañon called Diamond Creek. The water in it is clear, but there are no diamonds. We had not proceeded far before it became evident that we were too heavily weighted with clothing. The laddie flung off his blouse. Anaximander and Farlee took off their coats, and I parted with the skirt of my woolen frock. As we were to return by the same route we hung our cast-off clothing on the limb of a tree. The cañon was utterly uninhabited by human beings, as the Indians from some superstition never enter it. We had previously listened to a statement from a scientist in California that one peculiarity of the cañon was its freedom from noxious creatures. To be sure we saw horned toads—one was caught for the laddie—and georgeous lizards and strange insects. But presently Anaximander came to a halt and quickly said: "Hello, Farlee! What do you call this?" Farlee stopped and exclaimed "By jolly! if it aint a rattlesnake! I fairly lived in the cañon for three years, and that't the first varmint ever seen here," putting the heel of his high boot upon its neck. The poor thing had but one rattle and seemed harmless enough; but it made me think of similar "varmints" occasionally during our six miles' tramp that afternoon. But we encountered nothing unpleasant.

CATALOGUES, ETC., RECEIVED.

THE PREVENTION OF FIRE.—Pamphlet by Wm. P. Gerhard, C. E.—Published by the author at 9 Aster Place, New York.—Most of the matter in this work refers to methods to be employed in preventing fire in large buildings where many persons are found at one time—like churches, hospitals, asylums, etc. There is much that will be useful to the occupant or builder of an ordinary residence however. It is stated that the origin of a fire, incendiarism excepted—is always traceable to carelessness either on the part of the builder or occupant. There are too many cheap, shoddy buildings put up. They look fairly well from the outside, but within are filled with inflammable material, while the spaces between partitions and ceiling joists form concealed passages for rats, foul air and odors as well as smoke and flames. Through these a fire can spread with marvelous rapidity, while it is next to impossible to reach it with water. The first step towards the prevention of fire, then, is to see that the house is well built. Some excellent advice is given regarding sound building construction. The hollow spaces between floor boards and lath and plastering are objectionable. We often find them filled with chip shavings, painters' rags and other inflammable material. Rats and mice revel in their spaces. Rats often accumulate unburs. matches and also oily waste and greasy rags. Many a mysterious fire can be traced to these collections. All such spaces between floor joist should be closed by completely filling in from the sill or girder upon which the floor joists rest, to the wall, with concrete, plaster or brickwork. It is thought that for a roof on a country house, shingles laid over mortar are better than slate laid in the ordinary way. The careless manner in which timber is placed near to the masonry of flues and fireplaces is often the cause of fires. Where woodwork is placed near stoves it should be covered by bright tin. Warm air furnaces frequently prove causes of fire. They should be inspected frequently, from the furnace to the register. Furnaces should always be of ample size. If too small there are times when they must be forced to redness. It is safest to locate hot-air registers in side walls. When they are placed in the floor fine wire netting should cover them—otherwise combustible substances may be dropped into the flues. Hot ashes should never be placed in wood receptacles, nor piled up in the cellar nor against the building. Matches should be kept in tin or earthen boxes out of the way of rats, mice or children. Safety matches are best. The so-called "parlor" matches are dangerous. Speaking of protection against strokes of lightning, it is stated that the French Academy of Sciences formulate the rule that a conductor protects a circular area whose radius is equal to twice the hight of the rod above the roof. There are many excellent hints in the pamphlet which all builders or superintendents of public buildings will find interesting. Price, 60 cents.

MISSISSIPPI INDUSTRIAL INSTITUTE.—This institution is located at Columbus, Miss. It is, as we understand, the first school of its class for girls. At several other industrial schools, girls are admitted, but this appears to be the first one from which boys are excluded. The school is doing an admirable work. There are 341 young women in attendance, as we learn from the last catalogue. This is a remarkable showing for a State where local tradition so violently opposes an industrial training for women. The design of the institution is to fit young women to help themselves in the world; to make them independent and selfreliant. We should say that the institution had attempted too wide a scope. There are four departments; viz., Collegiate, Normal, Industrial and a Department of Music, and Fine Arts. Mississippi has already a normal school, and the university and other colleges are open to women. There are now, unfortunately, too many teachers of music and "fine arts." We should prefer to have the school more like that for the boys at Starkville, where the industrial side is so well advanced that one can see no other. The industrial department includes instruction in telegraphy, type writing, cutting and making garments, etc. We should prefer to see classes formed in dairying or poultry raising. It will be interesting to note the kinds of work these young women prefer. We find that 86 are studying type-writing, 52 telegraphy, 51 printing and 32 dress-making. Many are taking more than one of these studies at one time. We should prefer to see fewer typewriters. In order to obtain profitable work typewriters will be obliged to go to the cities. There are no large cities in Mississippi. The young women could do more good to themselves and their State by studying dairying, housekeeping and woman's part in agriculture. This would be more practical and profitable.

A LEAF OF THE CUT-LEAVED NORWAY MAPLE. From Nature. Fig. 411.

Arboricultural.

THE CUT-LEAVED NORWAY MAPLE.

ONE of the best of maples for small places or where round-headed trees are desired is a variety of the Norway called Dissectum (Acer platanoides dissectum). The specimen at the Rural Grounds has been growing about nine years; that is, the tree was received from the nursery nine years ago and was two or three feet high. It is now about 12 feet high, and being round-headed is also 12 feet in diameter. The stem is eight inches in diameter at the base, and branches out two feet above. The branches are crooked, or rather most of them changed their direction at every joint. The tree is well clothed with leaves, which as shown in the illustration, Fig. 411, are deeply cut into three parts, while each part is variously lobed. The leaves remain green later than many other kinds of maples, and do not change to the beautiful fall colors which we see in the Sugar and Swamp Maples.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

THE WOMAN OF TO-DAY.

[POEM READ BEFORE SOROSIS.]

As you walk the broad highways of culture and art,
O sweet, earnest women, of beautiful lives,
In your care of the intellect slight not the heart—
That germ of the old-fashioned mothers and wives.

The fair fields of progress are lovely, indeed,
With the white robes of women who march on to fame,
And the world is as ready to wish them God-speed
As once it was ready to hiss them to shame.

Oh! ho! for this era! this age of progression!
Be glad that you live in this wonderful time.
From the ruts of old creeds that bred wrong and oppression
We are marching out into a future sublime.

No more 'midst the sneers of an insolent throng
The woman of talent must make her gifts known.
Now the world doffs its hat as she passes along;
She is courted and sought, like the queen on her throne.

The feminine "doctor," once rudely assailed
By ridicule's shafts, has attained her true place;
And daintily habited, booted, and veiled
She enters sad homes like a vision of grace.

The pert paragrapher falls flat in his mirth
When he jests of the "blue-stockings" careless array
Her exquisite toilets are models for Worth
(Sorosis itself proves my statement to-day).

The women who *think*—in our cities and towns—
Are no longer objects of insult or fear;
"Society" copies their coiffures and gowns,
And whenever they speak the world pauses to hear.

Then, ho! for this century! Thought is the fashion!
The pathways are crowded to culture and art!
But, alas! for us all, if the warm springs of passion
Run dry in that time-honored organ, the heart.

In the drama of life, full of pathos and pain,
The scenes call for sympathy, tenderness, fire;
And the women whose hearts have dissolved into brain
Are not the star actors, who teach and inspire.

We were meant to be creatures of sweetness and love
Though the highways of knowledge are lofty and broad,
I know of fair hilltops that tower above—
The hills of affection that lie close to God.

In your strong, earnest efforts great good to attain,
Oh! earnest-souled women, remember this truth
It was love and compassion, not talent and brain,
That Buddha and Christ brought the world in its youth.

Brave, beautiful army, march onward and pray
For the truest conception of duty and right;
You can haste the dim dawn of a wonderful day
When the fair brow of Justice shall shine with new light.

A day when the sins of your fathers and brothers
By the eyes of the world are regarded the same
As the errors and sins of your sisters and mothers—
When men shall admit there is no sex to shame.

Formed by the same clay, by the same God created,
By the same passions stirred, the same temptations vexed,
Why should not our faults by the same rule be rated?
Why pardon one sinner and sentence the next?

This age is for women! The pathway is clear,
The boulders are gone that obstructed the past;
There is much to be hoped for and little to fear,
Your purpose and strength are respected at last.

The gates are wide open to knowledge and art:
As you cultivate gardens in intellects soil
Sun the fruit of your brain in the warmth of your heart
And the world shall acknowledge the worth of your toil.

ELLA WHEELER WILCOX.

OF INTEREST TO WOMEN.

EDELWEISS is now a fashionable bridal flower. They are dried in their European home, and steamed before using to restore the shape. This flower is an illustration of the glamor cast over the common place by poetic associations. It is a very ordinary woolly little thing, that would hardly attract attention were it not for its habit of growing on inaccessible precipices, or on the borders of glaciers. It is not half so pretty as our pearly everlasting, and greatly resembles the little mouse-ear so common on our hillsides in early Spring. If we honor the plant for its courage in growing on these bleak hillsides, why not give equal honor to the pretty, but not specially romantic cranberry? This chooses even more forbidding places of growth than the Edelweiss; we saw some tiny, careworn cranberry plants brought by the Greely expedition from Cape Sabine.

We saw an encouraging little incident on the Sixth Avenue Elevated Road recently. The cars were crowded, and seats were at a premium. An aqueduct laborer, covered with mud and clay, got up and offered his seat to a middle-aged woman, evidently returning from a matinee. She thanked him profusely, but energetically refused the seat, and insisted on his sitting down again, saying she knew he was returning from a hard day's work, and needed rest far more than she did. Such an example of courtesy on one side, and consideration, that is the essence of courtesy, on the other, needs no further comment.

ANXIOUS MARTHAS.

Some of Ruskin's sharpest and most trenchant words are directed against what he describes as "immoral cheapness"—cheapness so much below the actual value of the article, that it tells of dishonest workmanship or underpaid toil. The great critic continues to tell us that nothing is ever really *cheap*, and if we purchase an article for one-half its market value, some one must be cheated. This same rule holds good applied to household labor; there is a class of energy we may describe, after Ruskin's adjective, as "immoral industry." It is this that reduces a woman to a machine, and makes her forget all the graces that might have been in an unceasing round of drudgery. She is indeed a very Martha cumbered with many cares, too busy to listen to the voice of her Divine Master, even though He sit in her very household.

Domestic work does not always mean domestic drudgery. It simply depends on the point of view. But to make it more than drudgery, we must needs possess "a soul above buttons." Household cares must not be the main end in life, but simply a means to that end.

Morally speaking, the wife and mother has the highest of destinies, and her character and intellect should receive the highest cultivation. But alas! she does not always take this view, and too many appear to think that their duties end with their material cares.

And so they toil, until sweetness and comeliness is fled, and intellect or spirituality mere empty sound, perfectly content if they can be described as the most energetic and forehanded housekeepers in the district.

How we do feel for their children? Poor little predestined victims; to whom "mother" means no friend of loving sympathy, but an energetic machine, wound up for life, with no idea of duty save in making bread and butter, and pickles and preserves; in rubbing and scrubbing, and sweeping and dusting, until the very enumeration of her duties becomes a weariness of the flesh. This is not the type of every energetic housekeeper. We know many like "Josiah Allen's wife," who, in the midst of many cares, have practical sympathy for the suffering, aid for the needy, and a ready interest in every good idea agitating the community. And this is the type of busy housekeeper we honor. She is energetic in mind as well as body, and though she recognizes the material necessities brought before her, she does not confine her active mind to this alone.

It is a popular error—and a popular sneer—to say that the woman with a "mission" or the professional woman, is neglectful of her home duties. This may sometimes be a fact, but it is not by any means a self-evident axiom. It seems to us that a woman who gives herself up to material drudgery, to the extinction of intellectual growth, is as greatly to blame, as she who ignores the sweetness of working for those she loves. Domestic works alone, or intellect alone, will not make a perfect woman, she needs the combination of both. But, ah me! how full of briars is this work-a-day world, if we do but step out of the beaten path on either hand.

AN ILLOGICAL PROTEST.

"ELEANOR KIRK."

THE sensible article of "Worker" in last week's issue of your paper has stirred me up to send you a letter recently received from an indignant "wife, mother and housekeeper."

It is the strangest of all strange things that the busiest and most overworked women are the ones who usually resent any suggestions or advice in the matter of labor-saving, and generally insist that their daughters shall follow carefully in their footsteps. This is the letter:

DEAR MADAM: It seems very singular to me that a lady who boasts that she is an experienced cook and housekeeper should advise all of her sisters to become type-writers, stenographers, photographers and what not. I want to ask you if all the women rush to professions who is going to take care of our men and what will become of the children? Is it possible that you believe in giving up our kitchens to foreign servants? Now, I think there is as much credit in being able to cook a meal of victuals as to write a good story for a newspaper or take a photograph of a mass of rocks; and it is very wrong to keep saying to women, as you and some other woman's-rights women do, that they are overworked. In fact, I think it is a great shame. It is the fashion for women to complain now-a-days and blame their husbands for their own shiftlessness and laziness, and it is very easy to make some women nervous and dissatisfied. And then for you to make a mountain out of such a little mole-hill as the making of yeast. I can make yeast that will keep and make good bread and at a less expense than bought. I believe in saving my husband's money. In fact, I do all my own work for nine in the family, and make every garment that we wear, excepting shoes and boots, and if I was put to my stumps I could make them too. I don't ask any odds of anybody, and that was the way I was brought up. As a sample of the effect of such writing as yours, my daughter, who can't bear housework, said after reading one of your letters, that if she ever kept house she wouldn't break her back making soap and yeast, and her husband might starve to death before she would get up cold winter mornings, as I did, and make the fires.

It seems to me that such teaching is very dangerous. We are told in Holy Writ to do what our hands find to do with all our might, and though the shirkers of the world may have an easier time here, a day of reckoning will surely come hereafter.

Now, I haven't intended to hurt your feelings, but when I see a thing that I think is wrong, I feel that I have a commission to set it right. Yours respectfully,

MRS. ————,
Wife, Mother and Housekeeper.

"P. S.—I want to say that my husband is willing and able to hire help for me if I thought best to have it. In the Summer I average 50 pounds of butter a week."

The above is doubtless as honest an expression of opinion as ever came from the heart of woman, but how frightfully narrow and illogical. And what a showing! Fifty pounds of butter a week, and all the cooking, washing and ironing, scrubbing and sewing, for nine persons. It does not seem credible, and yet I am sure that every word of this dreadful story is true. I have seen and talked with just such ambitious workers, women, who at night are too tired in soul and body to read or visit, and who drag themselves out of bed every morning in the year, wan, weak and unrefreshed. Some go to pieces in harness, others suffer from chronic maladies, and some become helpless invalids. Others still lose their good looks, and their good nature, and grow as sour as the pickles they are so fond of making and spoiling their children's stomachs with.

Then look at the moral and religious side of this subject. How much spiritual growth is possible to the woman whose time from year's end to year's end is entirely occupied with the practical details of housekeeping? My correspondent asks what will become of our children, and who will take care of our men? God knows what would become of them if all our wives and mothers were like this one. Then she imagines that she performs all her duty toward her family when she washes their clothes, fills their stomachs and darns their socks? Is there no higher service than this? A woman can set a greater value on the ability to "cook a meal of victuals" than the writer. In her opinion, no woman has approximated toward an education until she can cook enough dishes to comfortably feed a family in an emergency, and knows how to care for the sick in practical fashion. She may sing with the sweetest of the poets, calculate an eclipse, or preach the most eloquent sermons. Sometimes these talents, grand as they are, have seemed like the veriest rubbish when some dear one has needed the special service that alone could preserve life, or make life endurable until the physician and nurse could be summoned.

Only a few days ago I heard a most accomplished woman remark that she had seen the time when she would gladly have exchanged every talent she possessed for the ability to make "a bowl of drinkable gruel."

No, No! Let us have as thorough a domestic foundation as possible, but let us at the same time instruct our girls that it is a sin and a shame to waste their strength and nervous energies anywhere, in the parlor, in the church, in the ball-room, in the kitchen. If women are so situated that they must do all of their own housework—as unfortunately too many of them are—wash, iron, bake and brew for "nine in a family," heaven grant them grace and patience. But when as in the case of my correspondent, this is unnecessary, may they come to have more sense than she has shown for if they do not she may well ask who will take care of our men, and what will become of the children?

Surely "Big oaks from little acorns grow," the acorns in this case being an innocent little yeast cake, a photographic camera, and a type-writer.

During the past Summer my heart has been cheered by the sight of girls striking out in new and unexpected directions, and I have not hesitated to make mention of these facts. Now, was it not for a woman who loves her sex, a novel and cheering spectacle to see young, intelligent and attractive women earning good money by taking photographs? There have been several such artists on the Rhode Island coast this Summer. One of these was an invalid from the effect of late hours tight lacing and fashionable life generally, in obedience to the infernal practice of dressing to please the eye of some rich man with a view to marriage. This girl not only took first-class pictures, but she entirely regained her health.

The next count in the indictment is the writer's advice to busy house-keepers to raise their bread with Fleischmann's yeast cakes instead of puttering and failing with home-made experiments.

In the name of common sense why should women add to their heavy burdens when skill and science have done so much to save them?

The time may come and perhaps is not far distant when this active and ambitious housekeeper will be very glad to have the baker stop before her door and leave the loaves which now she doubtless holds in as much contempt as the labor-saving material above mentioned.

HOBBIES.

ALICE GOLDSMITH.

"A HOBBY is one of the most useful things in life, and something which every young person should cultivate."

There is a world of truth and thought in the above. With a hobby the poorest clerk or the richest millionaire is supplied with a cure for *ennui* or worry, that will save him many a doctor's bill. If a young man who is confined to his desk for 10 hours a day, has a decided taste for botany or geology, he will employ his holidays in making excursions into the country, and the arranging of the specimens he may collect, will while him from sadder thoughts in the evenings. A talent for woodcarving, painting, mechanics or any of the many pursuits requiring deftness of hand, or quickness and correctness of eye, will prove a resource against business worry that will add years to his life. Children should be trained to encourage a taste for simple and wholesome pleasures that do not depend upon money for their gratification. To aid a child to develop his natural taste for any pursuit is the best way to form a "hobby." If a boy takes kindly to tools or mechanics, help him along; skill in any handicraft is a valuable possession. If he shows a partiality for any science help him to make a collection, or to do some original work, start him toward his hobby. If he has an enthusiasm for study and work, the subject makes little difference. At that critical age when the confidence of the youth is not tempered by the judgement of the man, devotion to a hobby, may serve to prevent the formation of habits which might wreck a career.

It is the inability of the business and professional men of this country to take rest from the wearisome routine of their life which drives so many of them to madness or suicide. Newspaper men are especially liable, by including Sundays and holidays among their workdays, to bring on a state of mental collapse that is almost as distressing as downright insanity. A little devotion to a "sane madness" for growing tulips or fancy peas, or raising birds, has saved more than one life. When a man has no resources of recreation in himself, business becomes a treadmill, and if he persists in it for many years, he will decrease in mental and physical vigor to an alarming degree.

I once knew a boy who had a hobby for collecting postage stamps. His time and money all went in collecting and arranging his beloved stamps. This only lasted for a few years of his boyish life, but even this was not useless. He was saved from idleness and its attendant evils, and from bad associations. He became a connoisseur in stamps and their values, and while gathering knowledge about them learned much that was worth knowing about the countries that produced them. When at 10 years of age he became the proud producer of a small printing press, he threw all his acquired habits of work and research into the production of his amateur paper, and to-day at the early age of 22, is a successful journalist standing high in his profession, still, however, with a "hobby"—this time for music.

Individuality is not encouraged as it should be in our schools. Teachers are overworked and have little time to study the mental peculiarities of their pupils. A child with a good memory may outstrip in class honors many a schoolmate simply by virtue of the superficial knowledge of all the studies which he has no trouble in acquiring. A boy or girl of an original turn of mind asks questions, wants to know the why and wherefore of things, and revolts at the mere memorizing of lessons, that he does not understand. The chief object of the best educators is the development of this tendency to ask questions and to refuse to be content with the mere learning of rules.

Life is too short to master more than a single department of any science. The ten-

dency of the day is in the direction of specialties. Law and medicine have been split up into specialties and if a man would make a name for himself he must narrow his field of work and cultivate it to the highest point.

GOLDEN GRAINS.

HAPPINESS consists not in possessing much, but in being content with what we possess. He who wants but little, always has enough....

To feel with and for others—what a glorious widening out and enriching of one's life that is? How it increases our joys because of the pleasure that we take in the joys of others! How it renders selfish brooding over our own woes impossible because of the sympathy we must give to the sorrows of others! Not generosity only, not kind-heartedness only, nor courtesy, nor unselfishness, nor keen perception, nor quick understanding—it is all these, and more than these.....

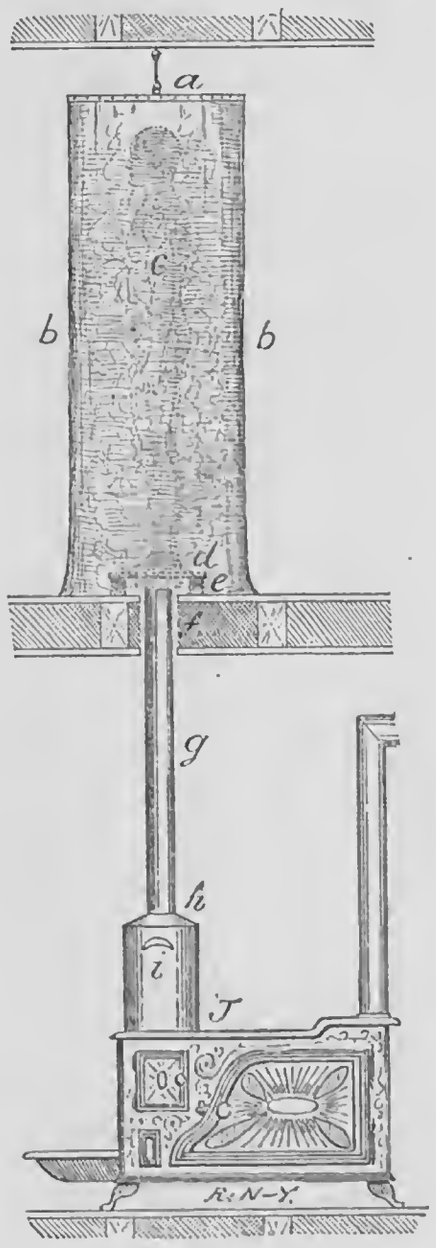
THE end of man is an action and not a thought, though it were the noblest.....

MAZZINI says: "Seek not to isolate yourselves; imprison not your souls in sterile contemplation, in solitary prayer, in pretending to a grace which no faith not realized in works can enable you to deserve. You can only save yourself by saving others. God asks not what have you done for your soul? but: what have you done for the brother's soul I gave you? Think of these. Leave your own to God and His law. Labor unweariedly for others' good. Such is the holiest prayer."..... .

LAY by a good store of patience and be sure to put it where you can find it..... .

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.



A STEAM BATH.

THE above illustration shows how the luxury of a steam bath can be enjoyed by any person in his own home at a small expense. I have had one in successful operation in my own family for over a year. To those who believe in keeping the body clean it will, I think, prove a boon.

A is a round piece of wood about two feet in diameter, and suspended from the ceiling of the second story. B is a large blanket tacked around A and reaching to the floor. C shows the position of the bather. D is a piece of board 18 inches square, resting on buttons E.E. (the ends being left open for the steam to come up) and placed over the opening in the floor F. The stove pipe G, which sets over a hole nearly as large as itself in the cover H, of wash-boiler I passes up through the opening in floor. To use it, build and maintain a "baking fire," put half a pail of water in the boiler, and place over the fire. Put up the pipe, which should reach entirely through the floor to prevent the steam from escaping. When the steam comes up in a cloud, step in, having previously placed a cloth by the openings at D, with which to regulate the flow of steam. Steam will soon condense on you, but that is not perspiration. In 10 or 12, possibly 15, minutes the perspiration will start in earnest. If the steam becomes too oppressive put the nose out between the edges of the blanket. Rub yourself all over from head to foot, thoroughly while in the steam. When the perspiration begins to trickle down the body step out and rinse down with plenty of cool water, and rub quickly until dry. The cold water and rubbing are necessary to prevent taking cold.

L. C. HOLMES.

IT is poor economy to scrimp in fires and lights.

MUSHROOMS.

THE GENUINE ARTICLE AND TOADSTOOLS. A DISTINCTION WITH A DIFFERENCE.

THIS most delightful and delicate edible, which Marion Harland calls a "contemptible and ill-smelling fungus," is most plentiful at the East in September and after the early fall rains. In San Francisco they may be had all the year, but, of course, are most abundant after the rains set in. At such times they are sold at very reasonable prices, and in the country may be had for the picking. The wild variety are much superior to the cultivated kinds, and there is less danger of poisoning from eating the former than is generally supposed. If you buy them from a reliable dealer you are not likely to purchase toadstools; if you gather them yourself you will soon learn the difference between the true mushroom and its less virtuous kindred. The first are of a dirty white color on top, and pink or salmon underneath, when they first spring up; after 24 hours, whether gathered or not, the pink turns to brown. The poisonous kinds are of all colors, some of them very beautiful, but like many other beautiful things, very dangerous. Those of a dead white above and below are especially to be avoided. The skin can also be easily peeled from the edges of a real mushroom, which is not the case with the false. If you are still in doubt, stir them while cooking with a silver spoon, and if it turns black, you will be on the safe side if you throw them away.

Beefsteak and mushrooms is a dish that few can resist. To have it at its best, lay a porterhouse or sirloin steak an inch thick upon a hot frying-pan. Use no fat except such as is on the steak, cook for three or four minutes, turn and cook on the other side. Season with salt and pepper *after* it is done, lay on a hot dish containing some bits of butter. Have ready a pint or more of mushrooms, according to the size of your steak, that have been peeled, washed and drained on a napkin; if they are large, slice them. Put a tablespoonful of butter in the same pan in which the steak was cooked, lay in the mushrooms, season with salt and pepper and cook for five minutes. Pour them over the steak; put a little water in the pan, give one boil, and add it to the gravy that will have already formed in the dish. This dish is greatly inferior if made with canned mushrooms.

Stewed mushrooms make a delicious little entrée at breakfast or dinner. Place a quart of peeled mushrooms, stems and all, in a stewpan with a very little cold water, and cook for fifteen minutes; mix a tablespoonful of flour with three of cream, and stir it into the boiling vegetable, add butter the size of an egg, and salt to taste.

Mushrooms of the larger size are nice for baking. Lay them, tops down, upon a baking dish; season with salt and pepper and place a bit of butter in each inverted cup. Bake in a hot oven for twenty minutes, basting several times with butter and water. If they are at all dry, pour a little melted butter over them when going to the table, and in any case, squeeze a few drops of lemon juice over them. The larger sized ones may be broiled on an oyster gridiron. Score the tops, dip them in melted butter, season well and broil over a clear fire. About two minutes on each side will suffice. Lay on a hot dish, and pour a little melted butter and lemon juice over them.

Mushroom patés should never be indulged in unless made with the freshest of mushrooms. Choose the small button size, stew them in as little water as will keep them from burning and add, for a pint of the mushrooms, a half cupful of hot cream, and thicken them by stirring one tablespoonful of flour in one of melted butter. Season to taste and place in ready-baked shells, freshly heated. Sprinkle a little finely chopped parsley over the top of each.

A mushroom catsup, much superior to that ordinarily sold under the name, can be made as follows: Lay mushrooms and salt in alternate layers in an earthen vessel, in the proportion of three ounces of salt to two quarts of mushrooms. After several hours break them in small bits, and set in a cool place for three days, stirring them every morning. Then strain, and to every quart of juice allow half an ounce each of allspice and ginger, a teaspoonful of Cayenne, and half as much powdered mace. Put into a covered stone jar, set it in a pan of boiling water, and do not let it relax its boil for four hours. Empty it into a porcelain or granite kettle and boil slowly an hour longer. Let it stand for twelve hours in a cool place; pour carefully from the sediment and bottle in very small bottles, as it spoils quickly when exposed to the air. PALMETTO.

KITCHEN TALKS.

ANNIE L. JACK.

THE Poultry Tender wonders if feeding on grapes is really bad for the hens: she does not get many eggs, and all the poultry have free access to the vineyard now that the crop is off. There are always unripe bunches left, and the chickens spy them out and eat them even after frost has made them quite tasteless. Some people say it is injurious to them, but we have never seen the question decided. Certain it is that eggs are a valuable article of food and well repay the necessary care given to the hens. They ought to be freely used at every farmer's table, for they, like milk, contain all that is required to make a perfect food. An egg contains about as much nourishment as an ounce of meat, and an ounce of bread. The Spaniards have 360 ways of cooking them, but to make a good omelet, and to boil, fry, scramble and poach them to perfection might satisfy any family. The "Epicure" looked delighted at the prospect of an omelet for supper and then with his usual "Why don't you," asked the reason we never made coffee with whipped egg and cream on it. The Amateur Cook said because good coffee like "good wine needs no bush" or egg to improve it. The white of an egg is very good for burns, and the skin of an egg is a cure for a boil. It is also a cure for a bruise if at once applied. So as the shell and white are useful to settle coffee, there is no part of the egg without its use. And it is encouragement for those who keep poultry to know that there is always a ready market for such merchandise. So far it is profitable to give the chicks the very best of care and to study the subject with intelligence. The old Plymouth Rock rooster crowed loudly at the door, and as the children drove him away, they repeated the old saying that "visitors were coming."

GLEANED FROM A STORY.

A STORY in the Overland Monthly, by Henrietta R. Eliot, entitled "Janet," contains a beautiful description of a daughter's love for her mother. The mother had married a man whose ideal wife possessed a true heart, a pleasing exterior, and youth with its large possibilities. Being a good little maiden, the daughter of a ranchman, and very pretty, her lover believed in the "large possibilities." But when he had married her, he found that he had mistaken an empty mind for one capable of being filled.

The husband died young leaving the mother to educate their daughter. This she did faithfully, and after the school days in the best Eastern schools were over, three years of careful study were spent in Europe before the mother and daughter returned to the mining town where Janet, the daughter, was born. Janet shrank from the society of the town—flashy, material and essentially vulgar, and for awhile so longed for the atmosphere of some Eastern city with its lectures, reading clubs, libraries and concerts, that she was almost ready to urge a removal thither.

Then she realized, without allowing the thought to fully shape itself, that where society is crystallized there would be no circle congenial at once to her mother and herself. This was decisive, for to take the devoted mother, who lived but for her, into surroundings that would constantly emphasize her deficiencies was a thing of which she was incapable.

At 19 she had been thrown into constant companionship with her mother. Before that she had nursed wild hopes that from constant association her mother's mind and tastes might grow like her own. But her hopes were now dead, and she had learned to take the fair gift of a mother's love as God gave it, and to let it manifest itself without that pecking surveillance with which the love would quickly have acquired a chronic attitude of semi-apology. For Janet's mother was as quick to feel a wound aimed at her heart as she was slow to take an idea aimed at her head.

"It is not given to one person to do much" was Janet's thought, "or if it is, the greater will grow from the less, but it is time that I, who have so long received should in my turn begin to give and help to improve my social surroundings if in ever so small a degree, instead of running from them." Are there not many educated daughters who might enrich their own lives and the lives of all about them by an equally unselfish attempt to make the most and the best of the society in which they find themselves placed? And especially by giving loyal love to those of their own homes, like Janet, allowing no pecking at peculiarities and deficiencies to fill their homes with painful unrest. ALICE BROWN.

THE fruit of the barberry makes a pretty garnish for meats and adds to the attractiveness of mixed pickles.

WE think plum and other boiled puddings are better if steamed instead of boiled in the water. The principle is the same and there is no danger of their becoming water-soaked.

DOMESTIC RECIPES.

RICE PUDDING.

One pint of boiled rice, one quart of sweet milk, four eggs and a spoonful of butter. Beat the rice, butter, milk and yelks together, bake one-half hour. Beat the whites of the eggs for frosting, add a little lemon, put this on the pudding and let it stand long enough in the oven to dry.

COTTAGE PUDDING.

Two cups of flour, one of sugar, two tablespoonfuls of butter, one teacupful of milk, one teaspoonful of baking powder, one egg. Stir together as you would cake, bake and eat with vinegar sauce.

GRAHAM PUDDING.

Two-thirds of a cup of molasses, two-thirds of a cup of sweet milk, two tablespoonfuls of butter, one teaspoonful of sugar, a little salt, two teacupfuls of Graham flour. Raisins if desired. Season with cloves, cinnamon and nutmeg. Steam one hour.

APPLE JELLY.

Pare and slice the apples. Take two quarts of water for one dozen large, tart apples, boil soft and strain through a flannel bag. Add to one pint of juice one pound of loaf sugar and the juice of one lemon. Boil 15 minutes, putting in the peel, and strain again.

LEMON JELLY.

Rind and juice of one lemon, one cup of sugar, one tablespoonful of water, one egg, one teaspoonful of butter, one of flour and thoroughly scald together. AUNT RACHEL.

Clergymen

Lawyers, Actors, and Singers, are often troubled with loss of voice, resulting from a slight cold, weakness of the vocal organs, or inflammation of the throat, and in all such cases may be promptly relieved by the use of Ayer's Cherry Pectoral.

I would not be without Ayer's Cherry Pectoral on any account. It is an invaluable remedy in Bronchitis and Lung Complaints, and speedily relieves Hoarseness or Irritation of the Throat, caused by public speaking.—Rev. E. Bethune, Janesville, Tenn.

I have been so much afflicted with Bronchitis that I should be unable to perform my clerical duties without the use of Ayer's Cherry Pectoral.—A. G. Kirk, Pastor Baptist Ch., Hillsville, Pa.

Ayer's Cherry Pectoral,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.
Sold by Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 3118, Boston Mass.

PURE MILK.

HOME NEWS.

SATURDAY, October 30, 1886.

UNTIL about three years ago a duty of 10 per cent. was imposed on goods imported from the Spanish West Indies or on Spanish vessels, more than on similar goods imported from other places and on other vessels, because Spain imposed similar duties on American goods and on goods imported on American vessels. Pres. Arthur removed such discriminating duties on the understanding that Spain would reciprocate. Spain insisted, however, that the treaty referred only to American goods imported on American vessels, whereas we insisted that it applied to any goods on American vessels—that the flag covered the goods. Two weeks ago, President Cleveland, by proclamation, restored the 10 per cent. discriminating duty, and it went into effect last Monday. Spain at once accepted our interpretation of the treaty, so the duty is again removed..... .....The great Minneapolis switchmen's strike is "petering out." The roads have appealed to the Federal Courts for injunctions and protection against the strikers. It was the action of the Federal Courts that caused the collapse of the great St. Louis strike..... ..... The great St. Louis Exposition just closed has cleared $80,000 in its 40-days' run... .....The world base-ball championship was won by the St. Louis American team at St. Louis Saturday, the sixth game with the Chicago League champions resulting 4 to 3 in favor of the home team .....The 50,000-candle-power electric light at Hell Gate this city, the only one of its kind in the world, proves a failure and will be discontinued by the light-house board. The light was so dazzling that pilots were blinded on emerging from the circle of light into the darkness beyond.....Rose Elizabeth has no more connection with Elder's Magazine—illness some say; fraternal displeasure say others..... .. Corporation Counsel Hoffman of Chicago has decided that bucket-shops in the city should not be protected by licenses and the mayor has been asked to close them. He said that he would rather have 50 gambling-houses in Chicago than one of the dangerous bucket-shops.....William Walter Phelps says that Mr. Blaine will not be a candidate before the next convention unless "the minority of the party—those who opposed him last time—ask for his nomination in 1888"..... .....William Gillespie Walker, nephew of James G. Blaine, has entered the Order of Jesuit fathers at Santa Clara, California. He is 19 years old and has been a student at the college for a year. Mr. Walker's mother was the favorite sister of Mr. Blaine and was buried on the day that President Cleveland was inaugurated.....We're having the liveliest sort of a canvass here for Mayor between Henry George, labor agitator, and land reformer; Abram Hewitt, Congressman, and manufacturer, and Theodore Roosevelt, ranchman, hunter, and good young fellow generally. The last is likely to got the solid Republican vote: the other two will divide the Democratic vote. Judging by the positive assertions of the followers of each, we are sure to have three mayors for the next two years, as each of the three is certain to be elected.....Blaine has been "stirring up" the Pennsylvania Republicans as vigorously as he ever "stirred up" Ben. Hill, but after a diametrically opposite fashion..... ....The Grant Memorial Fund has reached the sum of $123,503.....The hard coal owners of Penn., having formed an iniquitous combination and put up the price of coal, the soft coal owners are now plotting a similar combination for the same purpose. How long will the people endure such monopolistic extortion?..Four of the Pinkerton men engaged in the shooting among a crowd after the stock yard strike at Chicago, have been held for trial for the murder of Begley.... A patent has been issued to George Westinghouse, Jr., of Pittsburg, Pa., inventor of the Westinghouse air brake, for a new system of distributing electricity to be used for lighting and other purposes. The new invention will, it is said, effect a saving of about 95 per cent, in distributing main wires, as compared with the present system.....Baltimore is to have a crematory. Two years ago there was but one in the country; now there are 12 ....Much carping in Virginia and the South generally because President Cleveland on his visit to the Virginia State Fair at Richmond, last week, was not accompanied by Mrs. Cleveland. Many say she would have gone were it not that she would have had to "receive" with Winnie Davis, daughter of Jeff and of the South, and, however popular Frankie is, or was, in "Dixie," Winnie is far more popular.....Ex-Head-Chief Le Flore of the Choctaw Nation has died at the age of 75,--a man of rare administrative ability, considerable culture and high character. Was Governor for eight years and has been State Auditor since 1870.....Geronimo arrived at Pensacola, Fla., Monday and is confined with 14 other warriors at Fort Pickens on Santa Rosa Island, opposite the town. Chief Maugus, the last of the hostiles captured, with two or three followers, is to share his quarters.... The number of immigrants arriving at United States ports during the nine months ended September 30 was 294,720, against 268,688 for the corresponding period of 1885 .....It is estimated at the Treasury that the ultimate issue of the new $1 and $2 silver certificates may aggregate $50,000,000 and of the $5 silver certificates $60,000,000. This is an increase of the currency.....Any amount of disgraceful election scandal is still being ventilated in Ohio—bribery, ballot-box stuffing, election forgeries, etc., etc., have already sent several rascals to prison and are holding others under heavy bail for trial.....Sargeant Brainard (now a lieutenant) of the disastrous Greely arctic expedition, wants two years' time and $50,000 tod is coverthe limits of Grinnell Land. .....The President has suspended M. E Benton, District Attorney for the Western District of Missouri, a Democrat; and W. A. Stone, District Attorney for the Western District of Pennsylvania, Mugwump, for taking too active a part in politics contrary to the policy of the Administration.....From all indications it is pretty certain that the Canadian Government is preparing for general elections before the end of the year. Although the Liberals have carried the Province of Quebec, the present Conservative Government need not resign until the Provincial Government meets next year and the Ministry is defeated, and Sir John Macdonald thinks he will gain most there if the elections take place while his friends, the Ross Administration, are still in power. In the other Provinces also he expects to gain more if the elections are held this year than if they are deferred..... Cornell will henceforth grant no honorary degrees.....The Northwest Council has decided to appoint a committee of elected members to devise a scheme for dividing the Northwest Canadian Territories into Provinces and securing responsible government at the earliest possible moment ....Barnum's show took in $14,000 at Charleston in one day, since the quake!.....The mackerel season for 1886 has been one of the most discouraging ever known to New England fishermen. The total amount of mackerel packed at Portland, Me,, only foots up 2,000 barrels against 80,000 in 1885, and 155,000 in 1884. The amount packed there this year is the smallest known in the history of the place with two exceptions. The total catch of the New England fleet for 1886 foots up 69,000 barrels against 310,000 in 1885 and 404,000 in 1884..... ....Thursday 20,000 troops from this city and State and the neighboring States, tramped here through mud and slush caused by heavy rains for the most part of the previous 24 hours, from Madison Square to the Battery—a distance of 3½ miles—in honor of the unveiling of the colossal statue of "Liberty Enlightening the World," just erected on Bedlow's Island in New York harbor. A million of people, more or less, in spite of light showers, lined the muddy sidewalks, or stood on the steps and other elevations along the route. The President and most of his Cabinet, and a host of other celebrities added dignity and glory to the occasion. What with loss of wages, suspension of much business and extra extravagance, the thing must have cost New York $1,000,000 outside of the legitimate expense of the display. What a harvest the grog-shops gathered, and what a harvest the doctors must gather!..... .....It is estimated there are 1,000,000 French Canadians in the United States. A large meeting of them held Monday, at Chicago, enthusiastically favored annexation; their brethren in Canada, they said, also favor it,.. .... .. Postmaster-General Vilas says there was a postal deficiency of less than $1,000,000 on the last fiscal year against $9,000,000 expected. About $1,000,000 were lost by reduction in newspaper postage and $2,000,000 by the cheaper postage on letters .....Tuesday night, Oct. 25, the express car on the St. Louis and Pacific Road was robbed of $50,000 near Pacific Mo., by a man who brought the messenger in charge a forged note purporting to be from the route agent of the express company at St. Louis, telling him to instruct the bearer in the details of the business, as he was to be an extra hand. When the messenger was thrown off his guard, the stranger, after a struggle, overpowered, gagged and bound him; took all the bank notes and jewelry, leaving a great deal of silver as too bulky. The robber said he was "Cummings," one of the old Jesse James gang .. ..

AGRICULTURAL NEWS.

SATURDAY, Oct. 23, 1886.

TREMENDOUS rain storms have destroyed the Scotch oats and barley crops.....The steamship Rowena, fitted out with refrigerating compartments by the Anglo-American Fresh Meat Company of London, has arrived at Galveston, Tex., to take the first cargo of fresh meat to Loudon from any Texan port. She will carry 300 tons on her initial trip, though she has a capacity for 1,400 tons. If the venture proves a success the Rowena will make regular trips, and other vessels will be constructed for the Texas trade .....A telegram from New Orleans yesterday says: "White frost is reported at all points along the Mississippi Sound and within ten miles of this city. At Baton Rouge the mercury fell to 40 degrees above zero this morning. There was a killing frost at Jackson, Miss".....The Illinois Grain Dealers' and Shippers' Association at their meeting last week, appointed a committee of five to prepare a bill for presentation to the next legislature for the purpose of securing such legislation as is regarded important in the way of securing better inspection of grain and more uniform rates of transportation.....Two California tramps who took possession of John Joy's granary, near Chualar, helped themselves to some poisoned wheat which had been prepared for squirrels. Joy had hard work to keep them alive until the doctor came and gave them antidotes..... The price of milk delivered at the condensing factory in Elgin, Ill., from October 1 to April 1, averages three cents per quart net, and the farmers are dissatisfied, because in 1882-3 they got 3.8 cents. The average price at the Duchess County (N Y.) condenseries for this Winter is 3.21 cents per quart, or only about six per cent. higher than the Elgin price.... .. American apple buyers are making heavy purchases of Gravensteins in Nova Scotia, having lately bought 15,000 barrels in a fortnight. No import duty on apples; but most of the purchases were for European markets.... ....F. F. & and C. M. Austin, poultry and game dealers, in Faneuil Hall Market at Boston, received last week a consignment of live geese by rail from New York, which were to be fattened for market upon their farm at Mansfield. The geese were in crates, piled one upon another, and upon arrival 1,600 were found to be dead from suffocation. The remaining 1,400 are in bad condition and many will die. Loss about $2,000.... ...Hog cholera very virulent at the Westfield town farm, Mass. Affected hogs to be killed ..... A firm of cider manufacturers in Massachusetts has closed a contract with a party in New Hampshire for 50,000 bushels of apples at nine cents a bushel, delivered on the cars ready for shipping.....New Mexico is overstocked, and will, it is expected, market 50,000 beeves this Fall, unless the markets are ruinous..... The Anti-Horse-thief Association of Ohio, a growing body, held a meeting at Chillicothe a few days ago .....The exports of live stock from the port of Montreal from the opening of navigation to this time have been 55,533 head of cattle and 72,413 head of sheep against 56,060 cattle and 36,847 sheep in 1885, and 52,091 cattle and 50,443 sheep in 1884.....A parliamentary orator states that there are 800,000 less men employed in British agriculture than ten years ago.....The potato crop of Europe is reported to be much below the average in quantity, as well as somewhat affected by disease.....The American Cotton Oil Trust Company continues to be the subject of discussion in the Southern press. The whole matter is being thoroughly aired in the Texan papers and a very firm determination shown in that State to resist the monopolistic tyranny of this great corporation. There is a rumor that a number of New York capitalists are to start opposition mills in the largest planting districts as soon as the consolidation puts on the last twist of the screw. By selling the Oil Trust stock "short," they expect to make a pile by the fall in its price after the new mills are started..... .. .Attorney-Genera. Garland has given an opinion that the oils or samples used in the manufacture of oleomargarine are not subject to the tax unless made in imitation or semblance of butter.....The French Commission appointed to consider the question of an increase of duties on imports of grains and flour into France, will recommend a fixed duty of five francs per hectoliter—about 26½ cents per bushel. It is said French farmers can't pay their taxes unless they get higher prices for their products, hence the rise is likely to be made in spite of the workingmen's protest against dearer bread.....Prime Minister de Freycinet, of France, in reply to a deputation of merchants and workmen of Bordeaux, asking for a revocation of the embargo on American pork, the other day, said he had no doubt that the meat properly cooked is harmless, and promised to bring the matter before the Cabinet; but nothing is likely to be done unless we retaliate by imposing prohibitory duties on adulterated French wines, etc.....

Offers great inducements. Send for free illustrated circular and maps. J. F. Manch, Claremont, Va.—*Adv.*

Crops & Markets.

SATURDAY, October 30, 1886.

WITH regard to the potato crop, the last report of the Department of Agriculture says that while the average condition in July was 96.6, that of August declined to 88.3, the lowest for any August on record. Drought at time of planting, in some of the States of largest production, was the cause of this poor condition so early in the season and this, aided in New England and the Eastern States by rot, and more or less in every section by the Colorado Beetle, lowered the average still further, to 81.4 on the 1st of September. Since that time the decline has been very slight, standing now at 81.0, the lowest October average, with three exceptions, since the commencement of crop reporting in 1858. Usually the falling off in this month has been very sharp, ranging from three points in 1880 to 11 in 1885. In the New England States there has been little change in the condition of the crop, though rot still continues in many counties. The product in that section will apparently differ but slightly from that of last year. The States bordering the Atlantic, from New York to Georgia, show a marked decline, ranging from two points in South Carolina to 10 in New Jersey. This heavy falling off is attributed to excessive rotting, especially in New Jersey and Pennsylvania, with damage from Colorado Beetles and white grubs in various sections. The crop of New York is a medium one, fully one-third more than the product of last year, the average being 90 against 66. That of Pennsylvania is also a little better than that of last year. According to the September report, the Gulf States made the best showing, condition being high, and but slightly lowered from August. In this section the past month has wrought but little injury, and the average is still high, promising a crop of good quality and medium size. In the Ohio Valley and Northwest, the condition, while still very low, has materially improved since last report. The rains which broke the protracted drought of some sections, while too late to repair the injury from dry weather, were sufficient to essentially help the late crop. Some complaint of damage from rot and bugs comes from these States, but the short crop will be almost entirely due to unseasonable weather. The Michigan crop is this year far below an average. condition 71, last year 890 Ohio has a medium crop, and Indiana nearly an average one, while Illinois and the States beyond the Mississippi suffered greatly from the drought, causing a comparative scarcity in the West. In Kansas the injury from drought has been supplemented by serious damage from rot, and there was a decline of 13 points during the month. There has been a like serious falling off in California, Oregon and Dakota, attributed mainly to the injury from drought, its effects becoming more apparent as harvest is begun.

The area devoted to the sweet potato crop was largely increased in those States where it is a material part of the agricultural production, and the condition on July 1 was high. The wet weather in the South during that month was not conducive to good growth, and there was a slight falling off in the average of the larger States. This decline was continuing and more marked during August, and the figures of condition on September 1 gave evidence of local injuries from supersaturation in some sections and drought in others. There has been a further reduction during the past month, mainly from drought, in portions of South Carolina, Georgia, Mississippi, and Louisiana. Condition in principal States is: North Carolina, 93; Georgia, 90; Alabama, 92; Mississippi, 92; Tennessee, 95, and South Carolina, 94.

The supply of hogs at leading markets has been somewhat irregular the past week, being quite liberal a portion of the time, with some days of light receipts. The aggregate packing appears to be about 230,000 hogs for the week at all points, against 145,000 last week, and 265,000 for corresponding time last year. The approximate total packing from March 1 to date is 5,380,000 hogs, or 415,000 in excess of the aggregate to the close of the month last year, which was 4,965,000. In prices of hogs there was a decline at the beginning of the week at Chicago, and on Wednesday there was a further decline, prices averaging 30 cents per 100 pounds lower than a week previous, and about 20 cents per 100 pounds higher than a year ago. At Cincinnati prices are 15 to 20 cents lower than a week ago. Present prices of product at Chicago for January delivery are on the basis of $3.80 to $3.85 for hogs, while the average price paid last Winter there was about $3.70.

MARKETS BY TELEGRAPH.

SATURDAY, October 30, 1886

BOSTON.—APPLES.—King, $2 00@2 50; Baldwin, $1 37@1 52 per bbl; Hubbardstons, $1 50@1 60; Harvey, $2 00; common, 75c@$1 00. I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
in my Remedy, I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.
"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.
"Have used the remedy with success."—D. G. BARBER, Easton, Md.
This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.
"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIN, Grant City, Mo.
"We would not risk feeding a pen of hogs without the remedy."—WHITE & Co., Gibsonton, Pa.
"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.
"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.
"It has never failed to arrest the disease yet."—JONES & MUSSELMAN, St. Paris, O.
"I have sold over $3,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.
The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.
Prices, $2.50, $1.25, and 50 cents per package. 25 pound cans, $12.50.

For the Young.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

JOHNNY tried hard not to cry. One big tear squeezed out over his red cheek, but he bravely brushed it away with the sleeve of his jacket. The disappointment was great, but Johnny bore it well. His face worked a little, but he crept round behind the wood box where nobody could see him. I was glad to see the red haired young woman hand him a big doughnut while old Johnson was trying to straighten out his false teeth. Johnny kept his face in the shadow, but he put the doughnut into his pocket all the same.

We took our seats at the table in response to old Johnson's invitation—"Set by 'an see ef we can't take some 'o the heft offen these table legs," he said, and this answered every purpose.

He filled my plate so full that passing it was a dangerous operation. "Now then," he remarked "We won't call on you fer no remarks till ye clear that up. I jedge you ter hev a good idee of the vally 'o vittles. Thar won't be no room in your mouth fer no words whilst that plate holds out."

Bill Johnson could only roll up one eye in approval of these remarks. He had already begun a masterly attack upon his plate and could not talk. Johnny soon forgot his troubles. He tried to eat and watch me at the same time. This made rather dangerous business, for on several occasions he lost the range of his mouth and nearly ran his knife into his eye.

Mrs. Johnson was very polite. "Will you have your tea seasoned, professor?" She asked. I did not know exactly what the "seasoning" might be, but determined to risk it. I found that tea was "seasoned" when it contained both sugar and milk.

Old Johnson stopped his eating for a moment. "What be ye perfessor off" he called out in his harsh voice. "Don't wunter take no names thet don't belong to ye in this deestrict." I had no answer to make, so a silence fell upon us, broken only by the industrious knives playing upon the plates.

At last old Johnson pushed his plate away with a sigh of satisfaction.

"I guess I'll finish in the mornin'" he said after a careful survey of the table. "Ef you fellers eats this way right along, I'll hev ter kill another hog termorrer."

After supper I took my old place by the stove. Bill Johnson put on his hat and tilted back in his chair against the wall The ladies began to clear away the dishes. Johnny got out a broken slate and seated himself on the wood-box, where he worked laboriously at some writing.

"Say, teacher," broke in old Johnson's file of a voice. "I've got an idee for ye. When ye git sorter tired o' wanderin' round, why don't ye come here an' make yer suppositions to my hired gal. Il'l say a good word for ye whenever ye need it"

Here the young woman rushed frantically from the room with her apron over her face. Old Johnson's laugh spurred her on to extra speed.

"Now Iry, ain't ye 'shamed? You ain't settin' no example. What will you do with all them things ter answer fer—" said Mrs. Johnson solemnly. She took her hands out of the hot dish-water to hold them up on either side of her head. The steam from the hot water formed a thin frame about her face.

"Jest hark at them Methodist groans," said old Johnson with a chuckle. "Them's genewine Methodist groans, them is. Makes a feller feel sorter doleful, I reckon"

Mrs. Johnson went back to her dish washing with a deep sigh. The "hired gal" did not make her appearance again though old Johnson did his best to induce her to come. While he was shouting at her Johnny brought his slate to me. He kept his finger in his mouth and his eye on old Johnson as I read. This is what he had written:

"I recken ile bile Himm."

As soon as he saw that I understood it he hastily rubbed the writing out and went back to the wood box.

Shortly after the table had been cleared away, there came a loud knock at the door. Without waiting for any invitation, the door opened and a strapping young fellow walked in. He nodded to the company, hung his hat on the nail and brought a chair up to the stove. There he tilted back and put one foot up against the woodbox, pushing Johnny into one corner. There was no formal introduction, but I soon learned from the conversation that this was the redoubtable Jack Brawn himself. He paid little attention to me, so I had a good chance to examine him.

He was a strong, well-built fellow, with great arms and shoulders that were fairly bunched with muscles. I was obliged to admit to myself that if he should once get hold of me, my chances of remaining master of Bear Creek school would be decidedly dim.

Jack was evidently far from being at his ease, though he was dressed in the very hight of Bear Creek fashion. His boots were well greased, the "store lines" had not been rubbed out of his clothes and great cuffs and a collar were making his wrists and neck as uncomfortable as possible. His hair was well oiled and a bright red necktie gave him a very gallant appearance. But in spite of all this finery, Jack was ill at ease. He crossed one leg over the other, pulled at his collar and cuffs a dozen times and sharpened his knife on his boot.

Old Johnson seemed to understand matters. "Walk in an' see how things is Jack," he said. "Don't let nobody stand in yer light. Teacher here sorter frightened her away, but I'll lay you'll find her in the front room. I've set some wood in yunder, when thet burns up its time ter go home."

Jack glared fiercely at me during this speech. It was like a big dog looking at a smaller one. After some futher bantering he got up and walked into the other room. It is to be supposed that he found the red-haired young woman as he did not return.

I went to bed early. I did not care to listen to old Johnson's harsh voice, and I was tired. I had been asleep several hours when I was awakened by a step in my room. I started up suddenly to find Bill Johnson standing by the bed. He carried a bag in one hand while with the other he motioned me to be silent.

OUR drought is over at last. The rain came with a rush when it did come. I was caught out in it too. It began to rain just as I got off the cars to walk home. It was so dark that an owl couldn't have seen anything. The rain came right into my face. I borrowed an old umbrella and started. It was pretty hard to keep in the road. It is almost impossible for people to walk in a straight line when they can't use their eyes—did you know that? They are sure to go to one side or the other. I ran into several trees and apologized thinking they were men. I guess if I had run into a man I should not have said a word. I got home at last, all right, but pretty wet. There is only one thing to do in such a case and that is to get dry just as soon as you can. I took off my wet clothes and rubbed myself with a dry towel. After supper I "toasted" my feet in the oven. I am all ready for another night just like it now—doubly ready because I have brought a pair of rubber boots and a rubber coat. If I am going to be out in bad weather I mean to be dressed for it. I think it is pretty poor economy to try and save some money by not buying comfortable clothes, and then get cold or sick from exposure. Every dark and rainy night now, you can imagine Uncle Mark with his rubber coat and boots walking through the mud.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I am 13 years old. I live on a farm 20 miles from Pittsburgh. I have been reading the letters from the Cousins for some time back. I would like to join the Club if you will let me. Please do not put this letter in the waste basket.

I planted the Garden Treasures last Spring, but they did not grow very well. I set 30 hens last Spring, some with 18 eggs under them. They nearly all came out well; I raised over 250 fine chickens. I would have had 300 only for the rats killing some of them. I set two hens with turkey eggs. They came out middling well, but I only succeeded in raising one turkey. I suppose I killed them with kindness.

I drive a buggy to the store every week. I milk three cows and do half of the kitchen work. I intend going to school to-morrow. We had a fine crop of apples—1,000 bushels in the cellar and 500 bushels of potatoes.

I am trying to learn penmanship. Do you think I will succeed?

Yours truly, LIZZIE GARDON.

[Yes, you are going to be a very good writer. You are a good worker, too. I guess you are going to make a business woman. That is the kind Uncle Mark likes to see.]

DEAR UNCLE MARK: I am a little boy nine years old. My Grandpa has taken the RURAL ever since I can remember. I would like to join the club. I had a garden of my own for three years and sometimes the seeds did well and sometimes they didn't. I saw in the RURAL May 8, 1886, some Bantams I would like to have. Will you please tell me where I can get the birds, or eggs, and oblige

HENRY H. STEVENS.

[The Bantams were owned by Mr. Belmont Perry, of Woodbury, N. J. They were good ones, too.—U. M.]

DEAR UNCLE MARK: I am a little girl 13 years old, and would like to join the Cousins. Mamma has taken the RURAL for four years. I live on a farm of 80 acres. I live three miles from school. My riding horse died this Summer, so I have to walk now. The seeds that you sent us came up, but were killed by hail. The rest of the flowers did not do very well, because it was so dry. I have 15 ducks and one turkey. Your Niece,

Warrensburg, Mo. ELLA LAMB.

I have been wondering if Uncle Mark would give old Aunt Gerusha a chair for a few minutes in the Cousins' corner. I would like to tell them I have been surprised that they have not been more successful with the Garden Treasures from Uncle Mark. Now the seeds we get more than pay for the RURAL every year. If I don't want a hotch-potch of a flower garden, I just pour the seeds on a paper, take a pen-knife and in a few minutes separate them. I wish you could see an evening primrose that came from these seeds. It is a lovely lemon color and is the admiration of every one. In the afternoon it is covered with lovely lily-like blossoms which last until the next day, when new clusters appear. I took a slip last Fall which blossomed nearly all Winter in our city home. (We leave the farm and go home in the Winter.) You ought to see the admiring glances turned to our parlor window in the cold, stormy Winter at this beautiful flower. I have others very handsome, but fear my letter will be too long if I tell you about them now. I think I must say something about Uncle Jonathan's seed, else he will look cross. He has quite a field of thousandfold rye, which he saved from last year's yield, which is just splendid. The farmers come to look at it, and you ought to hear him brag. He sowed it the same day with the old kind, and it looks three weeks ahead of it. The Angel of Midnight Corn is also nice. I think that a queer name, don't you? but it yields well, and "what is in a name."

I fear if I tell about the peas and melons my letter will be too long and Uncle Mark won't let me visit you again? AUNT GERUSHA.

[Why, yes, Aunt G., we are glad to hear you talk. Come again and bring Uncle Jonathan with you.—U. M.]

DEAR UNCLE MARK: I would like to join the Y. H. C. and become one of the Cousins. I live on a farm of 320 acres, so there is lots of work for me to do. Our potatoes are not dug yet, so I will have to pick up potatoes, a job which I do not like to do. We have 95 sheep and lambs, 22 cattle and 10 horses.

Yours truly,

Brockway Centre, Mich. JOSEPH FOSTER.

[Your letter came some time ago. I hope the work is over.—U. M.

DEAR UNCLE MARK: I wrote to you once before and I saw it in your paper so I thought I would write again. My sister planted the flower seed. They were nice. We got one hive of bees last Fall. They swarmed in May then again on the first of June and the last of June. Our grapes are ripe. I want you and the Cousins to get some to eat. We have got 300 or 400 vines of different kinds. We have got the Concord, Pocklington, Niagara and two or three other kinds. We have a clover lot but musk-rats have just ruined it.

Your nephew.

Green Co., Pa. ALFRED P. STEVENSON.

DEAR UNCLE MARK: I thought I would write again. I am seven years old. I am going to school and reading in the Third Reader. Corn husking is at hand. Crop good. We have been having considerable company; some from Walla Walla, W. T., Iowa, Illinois and Indiana. We are having fine weather now. We have no bearing apple trees, but Pa has some coming on, and I hope they will bear soon. We thought the Garden Treasures were treasures indeed. Pa likes the RURAL very much. Which do you think the most profitable chicken? From your niece,

Edinburg, Ind. ALPHA A. DEUFREE.

[That is hard to say. I like Wyandottes and Plymouth Rocks pretty well, but the neighbors think they can make more out of White Leghorns.—U. M.]

We had a great time here at the celebration. The parade passed directly in front of our office. I shall say more about the Statue of "Liberty" next week. Perhaps, though, you all know about it now. We can't know too much about such things.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

A NEW VIEW OF CONSUMPTION.

And one which Appeals to Common Sense. Many Curable Cases.

[*Medical Stilys.*]

"MANY persons die of Consumption who could easily be cured," says Dr. S. C. Clark, of Watertown, N. Y., "if they should go at it right. I have a new view of the disease. Consumption is not always of lung origin."

"How so? What is it then?"

"Many cases of consumption are secondary. The disease itself prevails everywhere, but the best practitioners refuse to attribute it entirely to inheritance or the weather. If a person lives in the most favorable climate in the world and has any tendency to lung weakness, if certain conditions exist in the system, that climate, however favorable, will not prevent development of the disease. The disorder in such cases is only a secondary symptom in the lungs of some other ailment, and can never be cured until approached through its source."

"Yes, doctor, but what is the method of its approach?"

"If you dip your finger in acid you burn it; do you not?"

"Yes."

"If you wash this burnt finger every second with the acid, what is the result?"

"Why, constant inflammation, festering and eventful destruction of the finger."

"Precisely! Now then for my method, which commends itself to the reason and judgment of every skilful practitioner. You know certain acids are developed in the body. Well, if the system is all right these acids are neutralized or utilized and carried out. If the system is run down by excesses, anxiety, continual exposure or overwork, these acids accumulate in the blood. If there is any natural weakness in the lung, this acid attacks it, having a natural affinity for it, and if the acid is not neutralized or passed out of the system, it burns, ulcerates and finally destroys the lung. Is this clear?"

"Perfectly! But how do you prevent the accumulation of these acids in the system?"

"Irregularities of the liver and kidneys create this excess of acid and the supply can be cut off only by correcting the wrong action of these organs. The kidneys alone should carry out in quantity, in solution, enough of this acid daily, which, if left in the blood, would kill four men. When the stomach, the liver and the kidneys are *all* conspiring to increase the acid, the wonder is that weak lungs resist death as long as they do!"

"But you have not told us how you would treat such cases."

"No, but I will. The lungs are only diseased as an *effect* of this acid or kidney poison in the blood. After having exhausted all authorized remedies to correct this acid condition, I was compelled, in justice to my patients, to use Warner's safe cure; though a proprietary remedy, it is now recognized, I see, by leading physicians, by Presidents of State Boards of Health and by insurance physicians, as a scientific and the *only* specific for those great organs in which over ninety per cent. of diseases originate or are sustained."

"Is this form of treatment successful?"

"It is wonderfully so, and for that reason I am only too willing that you should announce it to the world of consumptives."

Note by the Publishers:—We have received the above interview from H. H. Warner & Co. Rochester, N. Y., with the request that we publish it *for the good of suffering people.* In a foot note to their letter they say:

"The experience of Dr. Clark is not strange to us. In our correspondence we have found that many thousands of people are suffering from what they think is Consumption, whereas the real difficulty is with the liver and kidneys, proven by the fact that when these organs are restored to health by the use of Warner's safe cure, the consumption disappears, and so does uremic or kidney poisoning, which causes so many symptoms of diseases that the human system is subject to. The same may be said of rheumatism, caused by an acid condition of the system. We insist upon what we always have claimed, if you remove the cause, the system will soon *perfect the work already begun.* Mrs. Rev. Dr. Theodore Wolf, of Gettysburg, Pa., wife of the editor of the *Lutheran Quarterly*, said her friends thought her "far gone with Consumption," but after a treatment with Warner's safe cure, she says: "I am perfectly well." We can cite thousands of such cases, but one is enough. If you publish the above article, *kindly send us a marked copy.*"

We gladly give place to the article, for if we can in any way stay the ravages of Consumption, which carries away so many millions yearly, it is our bounden duty so to do.]—PUB.

PERSONALS.

THE Crown Prince of Germany turns an honest dollar by selling milk from his dairy farm near Berlin. Sales 1,000 quarts a day

BARON FREDERICK FERDINAND VON BEUST, the distinguished German statesman, is dead in his 78th year.

HARRY GARFIELD, eldest son of the late President Garfield, is soon to marry his cousin, Miss Mason, of Cleveland, O.

ONE Australian farmer has just offered $75,000 for a rabbit-proof wire fence to extend 203 miles.

PRESIDENT FRANCES E. WILLARD and all the old officers of the National Woman's Christian Temperance Union have been re-elected.

MISS FORTUNES didn't come singly to Thomas Fortune, of Columbus, Wis., whose wife presented him with three girl babies at once the other day.

THE Rev. A. L. Dobson, of Quogue, has been awarded one of the four prizes of $25 each offered by Austin Corbin for the best crop of peanuts grown on Long Island.

WHILE chopping down a tree the other day Gladstone was stung on the face by a wasp; the papers reported that a swarm of them had put a horrible head on the Grand Old Man.

PRINCE ALEXANDER BATTENBERG, late of Bulgaria, has just bought the Charlottenfeld estate, near Schaffouse, Switzerland—price $100,000. He is reported to have feathered his nest pretty warmly.

A DISPATCH to a Chicago paper says: "Michael Davitt is soon to be married to Miss Yare, of Oakland, Cal. She is an orphan and lives with her aunt, is pretty, 20 years old and is highly accomplished. She has, it is said, $00,000 in her own right.

DURING the recent Western tour of Jay Gould, son and daughter-in-law, Jay told the people of Kansas City that their town would yet be a far greater city than Chicago, because it "has no lake to cut a large cantle out of its agricultural territory."

THE Pope has refused to allow any ornament to be placed on Liszt's grave, beyond an unpainted wooden cross bearing his name and the words: "Orate pro nobis." The more that becomes known of Liszt's life the more shamefully immoral does it prove to have been.

MR. W. W. CORCORAN has just started a suit to protect his title to land purchased by him in Washington 50 years ago. In the bill which he has filed he states that he is an adult and has been for more than 87 years a resident of the District of Columbia.

GOV. PATTISON, of Pennsylvania, says that at the conclusion of his present term of office, next January, he will return to his West Philadelphia home and resume his law practice. Being considerably under 40, he feels that his professional career is still before him.

IN Berlin, Tuesday, General Von Moltke celebrated the 86th anniversary of his birth. He is hale and hearty, rises at six o'clock every morning and passes much of his time in looking after the field laborers. He has constantly in his hand an ax, which he uses in chopping and trimming trees.

SINCE the Chevreul centennial celebration a great crop of centenarians has sprung up in France. The woods are full of them. It is seriously proposed to get a hundred of them together at a public dinner, M. Chevreul presiding. It would be as attractive as a baby-show.

J. I. CASE has bought the Glenview stud farm near Louisville, Ky. It contains 647 acres, and he paid $113.50 per acre for it. He also bought seven blooded horses, paying nearly $2,500 each for them. Jay-Eye-See, Phallas and Brown, the two-year-old, will be put into winter-quarters at Mr. Case's home in Racine, Wis.

MRS. CORNELIA MITCHELL STEWART, widow of many-times millionaire Alexander Turney Stewart, who died 10 years ago, died of pneumonia, after 24 hours' sickness, at her white marble palace in Fifth Avenue, this city, at 9:30 A. M., Monday, Oct. 25. Maiden name Chinch; born in this city Oct. 20, 1803—83 years five days old, therefore, at death. Married Stewart, then a small store-keeper, in 1823. A small, slight woman with an excellent figure and a smooth, fresh complexion, which she retained, to a great extent, to the last. Has left behind her about $35,000,000 probably to be fought for by relatives.

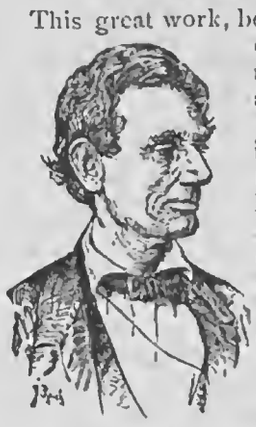
A GREAT ENTERPRISE.

THE CENTURY MAGAZINE, with its enormous circulation (edition of November number is a quarter of a million) and great resources, has never undertaken a greater work than the one which will be its important feature during the coming year. This is a history of our own country in its most critical time, as set forth in

THE LIFE OF LINCOLN,
BY HIS CONFIDENTIAL SECRETARIES, JOHN G. NICOLAY AND COL. JOHN HAY.



This great work, begun with the sanction of President Lincoln, and continued under the authority of his son, the Hon. Robt. T. Lincoln, is the only full and authoritative record of the life of Abraham Lincoln. Its authors were friends of Lincoln before his presidency; they were most intimately associated with him as private secretaries throughout his term of office, and to them were transferred upon Lincoln's death all his private papers. Here will be told the inside history of the civil war and of President Lincoln's administration,—important details of which have hitherto remained unrevealed, that they might first appear in this authentic history. By reason of the publication of this work,

THE WAR SERIES,
which has been followed with unflagging interest by a great audience, will occupy less space during the coming year, but will by no means be entirely omitted. Stories of naval engagements, prison life, etc., will appear.

NOVELS AND STORIES
include a novel by Frank R. Stockton, two novelettes by George W. Cable, stories by Mary Hallock Foote, "Uncle Remus," Edward Eggleston, and other American authors.

SPECIAL FEATURES
(with illustrations) include a series of articles on affairs in Russia and Siberia, by George Kennan, author of "Tent Life in Siberia," who has just returned from a most eventful visit to Siberian prisons; papers on the Labor Problem; English Cathedrals; Dr. Eggleston's Religious Life in the American Colonies; Men and Women of Queen Anne's Reign, by Mrs. Oliphant; Clairvoyance, Spiritualism, Astrology, etc.; Astronomical papers; articles on Bible History, etc.

PRICES. A FREE COPY.
Subscription price, $4.00 a year, 35 cents a number. Dealers, postmasters, and the publishers take subscriptions. Send for our beautifully illustrated 24-page catalogue (free). A specimen copy (back number) will be sent on request. Mention this paper.

Can you afford to be without THE CENTURY?
THE CENTURY CO. NEW-YORK.

Our Little Ones and the Nursery.

The Prince of Magazines for children from 4 to 10 years old. 32 pages each month of original Stories and Poems, beautifully illustrated with artistic and original drawings by the best living artists. Clubs with all Periodicals. Newsdealers sell it. Agents wanted. Send a two cent stamp for specimen copy.
One year, $1.50 **Single Copies, 15 cts.**
Russell Publishing Co, 36 Bromfield St., Boston, Mass.

WONDERFUL
SUCCESS.
Demorest's Monthly.
Containing Stories, Poems and other Literary attractions, combining Artistic, Scientific and Household matters. Illustrated with Original Steel Engravings, Photogravures, Oil Pictures, and fine Woodcuts, making it the Model Magazine of America.
We also propose to give considerable attention to the Grand PROHIBITION Party movement as one of the most important and live moral issues of the day.
Each number contains an order, entitling the holder to the selection of any pattern illustrated in the fashion department in that number, in any of the sizes manufactured, making patterns during the year of the value of over three dollars.
Send twenty cents for the current number with Pattern Coupon and you will certainly subscribe Two Dollars for a year and get ten times its value.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1920. NEW YORK. NOVEMBER 13, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

Dairy Husbandry.

OUR ANIMAL PORTRAITS.

JERSEY BULL, BRUNETTE'S PRINCE 7115.

A GOOD likeness of this animal is shown at Fig. 418. The bull stands in an easy posture, and there is nothing strained in the position of the neck and head as is the case with most bulls when standing for a photograph. Brunette's Prince is owned by M. B. Rowe, Fredericksburg, Va., and is a fine Jersey rich in butter lineage. His dam, Brunette Hammond 7284 (imp.) made 18 pounds 8 ounces of butter in seven days. His sire, Prince Hammond 3572 (imp.) is a son of Young Prince P. 182 H. C., which was half brother to Princess 2nd. with a record of 46 pounds 12½ ounces of butter in seven days. In the pedigree of Brunette's Prince appear such names as Khedive, Lee, Coomassie, Welcome and Princess, all honorable in Jersey history.

DAIRY NOTES.

T. D. CURTIS.

WINTER DAIRYING.

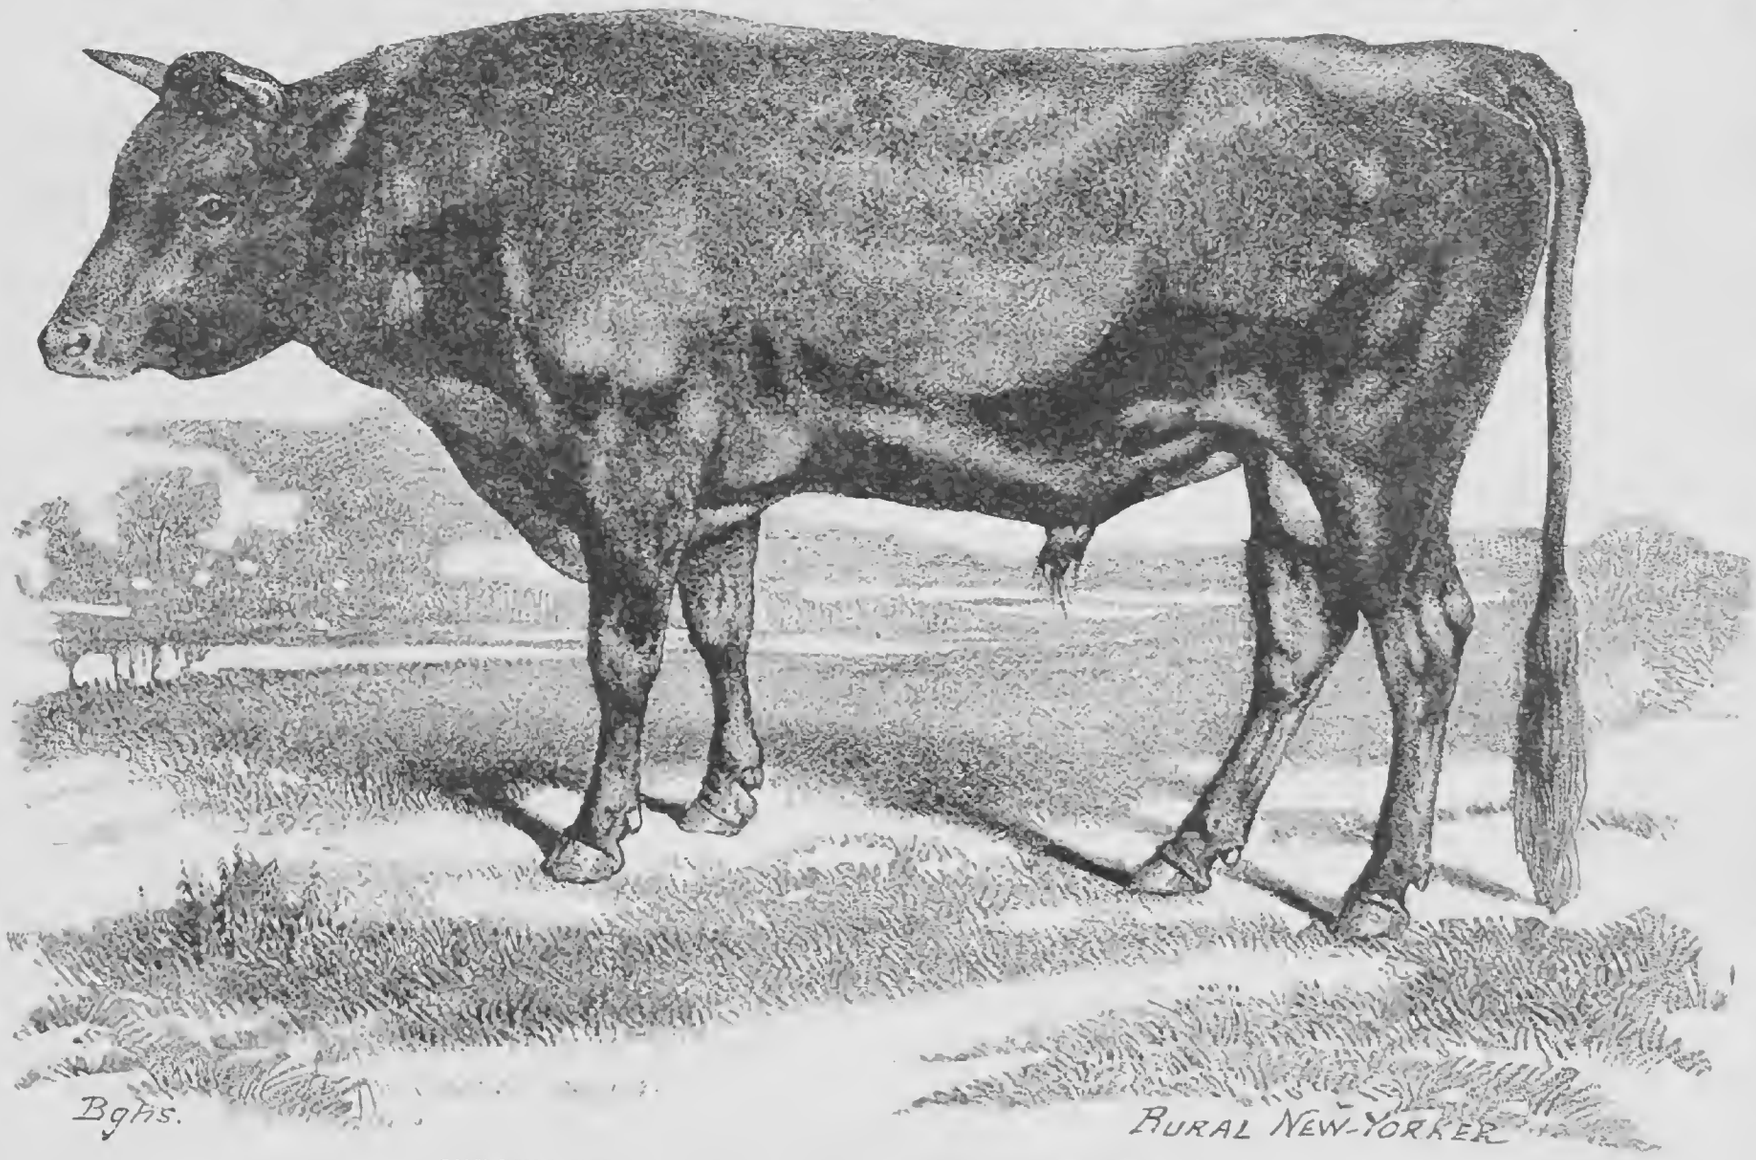
Cows ought to be well kept through the Winter, whether giving milk or not. How much more will it cost to keep a cow in good condition if she is giving milk than it will to keep her if she is dry? Whatever may be the additional expense is what must be charged to winter dairying—no more. The balance of the cost of keep is the normal one which must be borne anyway. It is therefore not so very difficult to figure out the cost of winter dairying over summer dairying. And it should be borne in mind that it costs more to keep a milch cow in the Summer than it does to keep a dry one; She must have enough additional feed out of which to elaborate her milk. So if winter dairying is carried on at an increased expense of keeping the cow, she is kept in Summer at a reduced expense. Then winter dairying secures better prices for dairy products, gives employment at a season of the year when most farm work is suspended, and gives the cow and family a rest in dairying through the Summer when other farm work is crowding. Thus the work of the year is more balanced throughout. These are all advantages not to be thoughtlessly thrown away.

CONDITIONS FOR WINTER DAIRYING.

Next to plenty of good nutritious food are warm, well ventilated stables for cows in Winter; and more especially are clean, airy quarters requisite in winter dairying. Few stables are as clean and sweet as they should be for dairy purposes. The milk, being warmer than the air, is constantly exhaling vapor instead of absorbing gases from it. The taints, therefore, are not so much from bsorption as from minute particles filth falling into it. But a still greater source of taint exists in a foul stable. The air is loaded with exhalations and odors from the cows and their droppings. Those are inhaled by the cows, and through the lungs are mingled with their blood. They thus go directly into the circulation, and as the milk is elaborated in the udder from the blood, the taints and odors are carried into the milk and give it the "taste of the barn-yard," which is so often justly complained of in Winter. In fact, the whole system of the cow is poisoned by the filthy fumes of the dirty, badly-ventilated stable. It is a marvel how little regard many who are counted good dairymen have for cleanliness and a sweet atmosphere in the cow-stable. This has suggested the remark that every one has some idea of cleanliness, however imperfect, but some people appear to have no sort of idea of nastiness. To them, all things are clean!

CHEAP SALT.

Just now the rage is for cheap salt, on the score of economy, notwithstanding the best salt can be used at a cost of less than a mill a pound for the butter salted. Dairymen and creamerymen have been heard to say, "My butter is contracted for at the highest market price, and I get just as much for it when I use cheap salt as when I use the best." This is dishonest. It throws the loss from the short life of the butter on the buyer, in case it does not go immediately into consumption. A Chicago expert, while in New York, examined some Elgin creamery only three weeks old, and found it abominable. Yet it had been bought for a high price, and should have been perfectly sweet at that age. But the Elgin district has been seized with cheap salt economy. Buyers who have been bitten will either refuse to buy, or look into the cause of the early decay of some of the Elgin butter. They will probably find it in the cheap salt used.



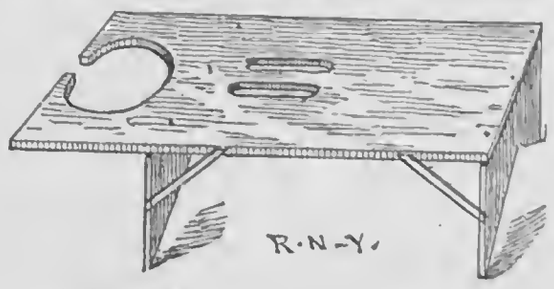
JERSEY BULL, BRUNETTE'S PRINCE 7115. Fig. 418.

TO PREVENT MILK FEVER.

MR. KEMP BOURNE, of England, for years past has kept his cows free from milk fever by the simple practice of allowing the calf to remain with the dam for three days at least and suck what it would. During this time if any quarter of the udder became much distended in consequence of the calf neglecting it, he then milked as much from that quarter as was necessary to remove the painful pressure of the milk within it. He explained that after parturition, the womb and contiguous parts were naturally in an inflamed condition, and the sudden removal of the milk causes the upper portion of the udder to become chilled, and that this was the cause of the disease. A friend to whom he imparted this method of preventing milk fever had a large dairy herd, but he found it desirable to remove the calves from the cow immediately after birth. An hour from this he drew about one-fourth of the milk from their udders by hand; on the second milking, one-third; at the third milking, one-half; on the fourth milking, three-quarters; on the fifth milking, which would be on the third day after calving, he drained the cow dry. Out of 2,000 cases of parturition that passed under his hands since 1862, he has never had a case of milk fever.

A GOOD MILKING STOOL.

I SEND you a drawing of a milking stool which I like better than any I have seen illustrated in the RURAL. It is shown at Fig. 423.



A GOOD MILKING STOOL. Fig. 423.

The stool is 10 inches high and made as shown in the picture. My milking pail has a tilting handle near the bottom. I put the pail in the hole of the stool, with tilting handle at opening, and push it down until the handle is under the stool, and then twist the pail to right or left, and it is secured to stool, but can be taken out and put in in a few seconds. The hole must be of proper size so that the pail will fit closely but not too tightly. The holes near the center of the stool make a good handle for carrying it about.

Halifax Co., N. C. G. C. WEEKS.

OLEO IN INDIA.—In 1857 the sepoys or native soldiers in the service of the East India Company, rebelled in the vast Presidency of Bengal, British India, and the rebellion was suppressed only after the rebels had committed the most fearful outrages on the "whites," and the whole military resources of the British Empire had been taxed. The cause of the trouble was a report that in order to convert the men to Christianity the cartridges for their rifles were defiled with grease which they would have to tak into their months on biting the cartridges, and so lose caste, or commit an abomination, which they thought equivalent to conversion. A panic has lately seized upon the Bengalese on account of a discovery that ghee, the clarified butter which they eat themselves, and which they offer to their gods, is being adulterated with fat. The Mohammedans fear that their ghee may be larded; the Hindoos are equally afraid that their ghee is mixed with the fat of oxen or of sheep. To eat such fat is in their eyes a deadly sin; to offer it to their gods an infamous sacrilege. Hence legislation in hot haste against impure ghee, and suspension of all standing orders in order to hurry the bill through all its stages without delay. Who can say how many souls might be lost forever if oleomargarine were once to be introduced among the natives of India? What a fertile field of speculation is opened up by this incidental illustration of the political, social, and religious effects of a simple invention in the art of manipulating fat.

CLEANLINESS IN THE MILK BUSINESS.—When I was in the milk business I tried to be as neat as possible. I always changed my boots and took off my overalls before I got into the milk wagon. We strained the milk three times into a can that stood just back of the cows. Still we had customers that complained. I would see some of them turn up their noses as they came near me. Of course, I called them "dudes." One day a good friend said to me: "I can smell the barn whenever I get within five feet of you. You can't notice anything wrong about yourself, for you are used to it, but your customers are not, and they notice it at once." That set me to thinking. There is a good deal in the idea that people who do the barn work are in danger of

losing that nice discrimination in the matter of smells that their customers possess. We can't be too clean about handling milk and butter. I never could satisfy my customers till I strained the milk outside the barn and changed my clothes entirely.

OLD MILKMAN.

A GOOD MOVE.—The managers of the Brown County Agricultural Society have hit upon a new plan which is noted in the Breeder's Gazette. They propose to invest the surplus funds of the society in Short-horn, Hereford and Holstein-Friesian bulls. These bulls are to be placed in the neighborhoods where several society members live. In this way it is calculated that the value of the live stock will be greatly increased, and it is probable that many farmers will be led to take an active part in the society, who otherwise would not join. The idea was a good one—others might follow it.

The Herdsman.

THE ARITHMETIC OF GOOD BREEDING.

E. W. PERRY.

Worth, in dollars, of the services of good bulls; what "might have been;" productive value of a good bull; comparative value of "scrubs" and good grades; in the shambles and the dairy; differences in prices for a series of years; specimen losses in Texas; $9,000,000, the cost of pure-bred bulls there, would have brought the stockmen from $48,750,000 to $112,500,000; now is the opportune time for improvement.

IN the year 1884 the Department of Agriculture, which is doing good work for the farmers of America, ascertained that there were in this country 45,547,300 cattle. Of these 13,501,206 were milch cows, and 29,046,101 were working oxen and other cattle. The value of these cattle, unimproved, would have been $819,263,787; but of the entire number 18 per cent. were improved by the influence of good blood. The increase in value was equal to 35 per cent, or $287,451,900. That shows with reasonable exactness what the work done by good bulls was worth. To show what increase in wealth cattle owners might have made by using the influence of good blood as fully as they might have used it, I will suppose that the owners of all those cattle had in every instance used highly-bred bulls to improve the entire supply of cattle. It is clear that if the improvement of 18 per cent. was worth $287,451,900 that of the remaining 82 per cent. would at the same rate have equaled $1,309,503,555, which, added to the above sum, would have given $1,596,955,555 as the actual cash value of the influence of the four-legged missionaries whose praise I proclaim. It cannot be said that this could not have been done, for more good bulls than would have been needed to do this great and good work have been sacrificed in their early youth, or cut down in their prime. As there were some 13,501,200 milch cows, it is clear that, allowing to each bull a congregation of 40 female members, 337,530 missionaries would have been required. The value of their work, as shown above, would pay an average of $4,731.30 for the services of each bull. Deduct from that the cost of his keeping and interest on his price, and we have the productive value of each really good bull; yet there are those who will still declare that no bull can be worth the fancy figures asked by breeders—figures ranging from $50 upward.

In 1884 a common "scrub" cow was not worth an average of more than $30; but the half-Jersey or half-Holstein cow at that time sold readily for $50 to $75, and many of those kinds were sold for $100 to $150 each. Suppose a purely-bred Holstein or Jersey bull had begotten each year, from forty cows, thirty-two calves that would have reached maturity, and that half of them were females, the cash value of his services that year would have been, through that one-half of his get alone, and at the lower prices then received for half-breed cows, from $320 to $720. At the higher figures, which were by no means uncommon, the increased value he would have given to those calves would have been from $1,120 to $1,930. Those female calves would have been to the plain farmer who sells milk or butter or cheese actually worth more than the difference in price between them and the scrub or unimproved cows, as any progressive, intelligent dairyman can prove.

But, leaving the consideration of the milk and the butter breeds, let us look at the production of beef, which is perhaps the least profitable use to which our cattle are put. For many years Texas has sent to market an average of a quarter of million beeves. These have averaged some 900 pounds in weight and have not averaged more than $27 in price. During those years grade bullocks averaging 1,000 to 1,200 pounds have sold for 4 cents to 4¾ cents per pound, or for $40 to $57 per head. The difference in price between the two classes was from $13 to $30 per bullock, making a total difference of $3,350,000 to $7,500,000 between the prices Texas might have received and those she did get for her 250,000 cattle yearly. This has been going on for fifteen years, for although Texas now sends many improved cattle to market she continues to send about a quarter of a million unimproved beeves each year. To beget the 250,000 improved cattle each year, Texas would have required 6,000 purely-bred bulls. At $500 each they would have cost $3,000,000. If each had served five years as he could have done with profit, three lots costing $9,000,000 would have been needed. But if those bulls had added only two cents per pound to the selling value of the 250,000 cattle they would have increased by some $4,500,000 the annual income of Texas, even if they had added nothing to the weight of the stock. The fact is that $9,000,000 worth of bulls would no doubt have brought to the purses of the Texas cattlemen, in these 15 years, $48,750,000 to $112,500,000 more than they have received.

There is enough in these few simple examples in the arithmetic of good breeding to give an idea of the value of the influence of pure blood; and many more illustrations can be given if need be. Is it not high time to preach the gospel of pure blood to the masses, to that vast multitude who having ears hear not, or hearing do not heed? Was there ever a better time than this in which to begin the work of improvement? We have got the breeders down now—their best cattle sell for less than they could have been sold for three years ago, and their good stock, not quite so fancy perhaps as the best, are selling for little more than two-thirds the sums they would have readily brought then. Cattle of all kinds are going at low figures; the cattle business is in a hollow between the waves; will it not be a very good plan indeed to go in now that we may be ready to rise on the coming wave to prosperity? Is it not a duty to ourselves, our children and the nation to so add to its wealth that there will be billions of dollars more than there will be if we go on in the old, slipshod, ignorant way, to spend in educating the coming generations?

Cook Co., Ill.

A CHEAP STOCK RACK was made by us in one evening by using three 6-inch boards the length of the wagon box, for each side, six 6-inch boards four feet long for standards for each side, to be bolted with ⅝-inch bolts three inches long; standards to be fastened 3½ inches from the ends of the rack and in center spaces 6 inches; length of standards below bottom board 18 inches. Bolt a 2 x 2-inch strip 30 inches long on each end of side boards for cleats, for the end gates. The end gates are made of the same material as the sides—only bolt 4 standards 8 inches wide, 4 inches from each end. Use iron rod through the middle boards on each end as in the end gates of a wagon box: 42 ⅜-inch bolts are necessary. The rack may be painted. The standards of the rack are to slip over or down on the outside and inside of the wagon box.

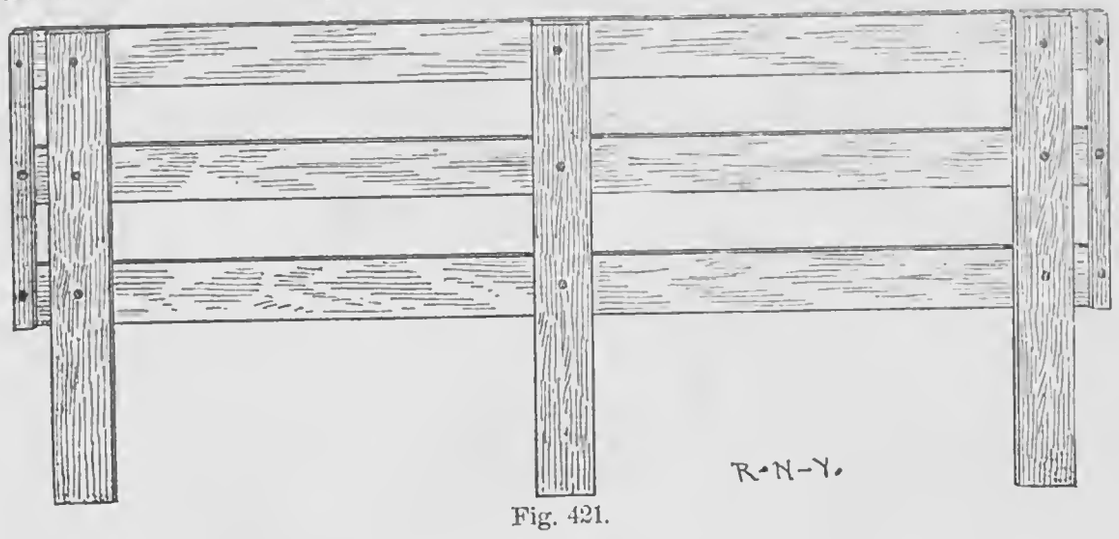


Fig. 421.

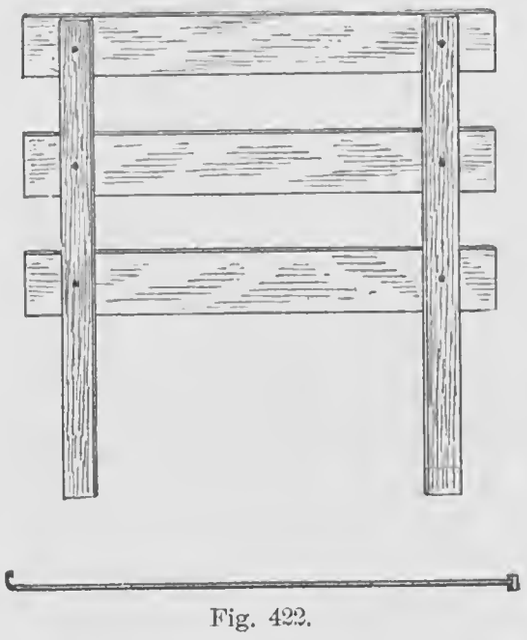

Fig. 422.

GEO. PELTON & SONS.

Sauk Co., Wis.

ONE thousand sheep were recently poisoned in South Africa by the use of an arsenical powder dip. The sheep were dipped for the scab. After a second dipping they died in great agony in consequence of the absorption of the arsenic through the skin. With the efficient yet absolutely safe means of exterminating insect pests in our hands to-day, we have no place for poisons on living animals.

Horseman.

THE BREED OF HORSES IN FRANCE.

THE improvement in the breeds of horses is helped considerably by the Government, which each year appropriates certain money which is paid in awards to successful horsemen. Each year a report is furnished by the Government, which shows the number of horses and their values at the various establishments. This report has just been published and states that the total number of sires in the 22 depots belonging to the State was 2,517 at the beginning of last year, and that out of this total, 2,463 were in actual use. The loss was 43 by death, and 219 were cast, so that 262 vacancies have to be filled up. The total number of stallions belonging to private individuals which had received the State certificate of approval was 1,308, and of these 260 have since died or been rejected as unsound. Nearly a fourth of the stallions belonging to the State as well as the approved ones were weeded out for roaring or other affections of the throat or lungs. Out of the 242 sires purchased during the year 162 were half-breeds, 50 cart-horses, 20 Thoroughbreds, and the rest Arabs. Of the 20 Thoroughbreds five were bought in England and cost $37,500. During the past year 784 Thoroughbreds were foaled in France, and the total amount of the prize-money given at the various meetings was more than $1,000,000, so that owners of Thoroughbreds have plenty of opportunities for making them pay their way, more in proportion than in any country in the world. The number of Thoroughbred mares on the stud-book last year was 1,997, or 51 fewer than in 1884. Out of the 3,734 stallions belonging to the State or approved, 288, or not quite eight per cent., were Thoroughbreds. There were 261 Arabs, 2,385 half-breeds of all kinds, and 800 cart-horses. Altogether there were 189,078 mares. The exports, which in 1884 exceeded the imports by 3,320 head, last year rose to 13,481 head. This is owing to the large number of Percherons that are coming to this country.

CANADIAN HORSES UNFIT FOR CAVALRY.—The committee sent by the English government to examine Canadian horses with a view to purchasing some for cavalry purposes, after inspecting over 2,000 horses on the northwestern ranches, report that they have been able to obtain very few that meet their requirements for the following reasons:—1. Being too young. 2. Being too small, with shoulders more for draught than riding purposes. 3. Being unsound. A year or two would remedy the first objection; but to obviate the second the use of thoroughbred sires is necessary. More attention must be paid to handling and breaking the yearling colts; scarring all over with branding irons must be avoided. As regards soundness, much may be due to the sire, but a great deal is due to the rough handling and lassoing of the young stock, which in some cases nearly kills them outright, and oftener is the cause of curbs, spavins, etc., being sprung by an undue exertion of the joint in the struggles of the young stock during their rough treatment. The Clydesdale and Percheron seem to be favorites, and the Commissioners say these may be good as heavy draft stock producers, but for all saddle purposes they are utterly useless. The cross between these large sires and the undersized mares is too violent. No one would think of crossing the Newfoundland and the toy terrier, and hope to produce an animal of any value or use, and it will be found the same with horses so different in size, and damage will be done that never can be eradicated.

The Swineherd.

PICKLED MEATS, ETC.

COL. F. D. CURTIS.

BESIDES the different forms of dressed pork, there are standard pickled meats, shipped in pickle in casks for both domestic and foreign trade. Large quantities of bacon packed in salt dry, in boxes, are shipped abroad and smoked on the other side of the ocean. The following are the descriptions of standard pickled meats, the cut meats and those cut in imitation of the British "cuts." The list also includes lard as required to be tried and put up for the trade:

STANDARD SWEET PICKLED HAMS should be cut short and well rounded at the butt, properly faced, shank cut in or about the hock joint; to be reasonably uniform in size, and to average, in lots, not to exceed 16 pounds. Three hundred pounds, block weight, shall be packed in each tierce, with either 24 pounds of salt, three quarts of good sirup, 12 ounces of saltpeter, the tierce to be filled with water; or the tierce is to be filled with sweet pickle made to above standard.

STANDARD SWEET PICKLED SHOULDERS should be cut and trimmed, reasonably uniform in size, and to average in lots not to exceed 16 pounds. Three hundred pounds, block weight, shall be packed in each tierce. Pickle the same as used for hams.

NEW YORK SHOULDERS should be made from small, smooth hogs, shank cut off one inch above knee joint, trimmed close and smooth, reasonably uniform in size, and to average, in lots, not to exceed 14 pounds. Three hundred pounds, block weight, shall be packed in each tierce. Pickle the same as used for hams.

SWEET PICKLED BELLIES should be made from nice, smooth hogs, well cut and trimmed, to average, in lots, not to exceed 14 pounds. Three hundred pounds, block weight, shall be packed in each tierce. Pickle the same as used for hams.

BRANDING.—The packer's name, location, number of pieces and date of packing shall be branded on the head of each package of pickled meats at the time of packing. All pickled meats should be sized when packed; the light, medium and heavy separately, as nearly as practicable.

CUT MEATS.

HAMS should be cut short, well rounded at the butt, properly faced, cut in or above the hock joint.

SHOULDERS should be cut as closely as possible to the back part of the fore arm joint, butted off square on top: neck bone and spare ribs taken out, blood vein lifted and cut out, breast flap to be trimmed off, and foot to be cut off in or above the knee-joint.

BLADED SHOULDERS should be cut the same as standard shoulders, except that the shoulder blade is to be taken out and the corners rounded.

ROUGH SIDES should be made by slitting the hog through or on one side of the back bone, and an equal proportion of both sides must be delivered on sales to make them standard.

SHORT CLEAR SIDES: the back-bone and ribs should be taken out, the hench-bone or breast-bone sawed or cut down smooth and even with the face of the side; the feather or blade-bone is not to be taken out, and the sides are not to be backstrapped or flanked.

SHORT-RIB SIDES: the back-bone should be taken out, the hench-bone and breast-bone sawed or cut down even with the face of the side, the feather or blade-bone not to be taken out, and sides not to be backstrapped or flanked.

LONG CLEAR SIDES; the back-bone, shoulder-bones and ribs must be taken out, the leg cut off close to the brisket, the hench-bone and breast-bone be sawed or cut down smooth and even with the face of the side, and the sides are not to be backstrapped or flanked.

CUMBERLAND SIDES: the side and shoulder should be left together in one piece; the leg be cut off below the knee-joint; shoulder-ribs, neck-bone, and back-bone taken out; the blood vein lifted and cut out; the hench-bone and breast-bone sawed or cut down smooth and even with the face of the side, and sides not to be backstrapped or flanked.

LONG-RIB SIDES should be made in the same way as Cumberlands, except that the shoulder-bones must be taken out and leg cut off close to the brisket.

STRETFORD SIDES should be made from hogs weighing about 140 to 160 pounds net: the back-bone and half of the ribs should be taken out,

the blade-bone taken out, knuckle left in, and leg cut off close to the breast.

BIRMINGHAM SIDES should be made from hogs weighing about 170 pounds net; the backbone, ribs, blade-bone to be taken out, the pocket piece cut out and pocket nicely rounded, knuckle-bone left in, and the leg cut off close to the breast.

SOUTH STAFFORDSHIRE SIDES should be made the same as Birminghams, except that the loin should be taken out fully to the top of the shoulder-blade, leaving only a thin strip of lean along the back; knuckle left in, and leg cut off close to the breast.

YORKSHIRE SIDES should be made the same as Cumberlands, with ribs out and legs cut off about two inches above the knee.

IRISH CUT SIDES should be made same as Long Clear, except top of the pocket cut off, knuckle-bone left in.

LONG HAMS should be cut from the side by separating with a knife the hip bone from the rump, properly rounded out, foot unjointed at first joint below the hock joint.

SOUTH STAFFORDSHIRE HAMS should be cut short, hip-bone taken out at socket-joint, hock unjointed at first joint below the hock joint.

IN PACKING MEATS in boxes, the pieces should be classified, the light, the medium and the heavy separately, as nearly as practicable, in packages made to suit the different sizes; all the salt possible to get in is put into the boxes, between the layers of meat and on the top and bottom. Cut meats, also hams and shoulders are packed in the slaughter-houses in tiers with salt at the bottom and between. Meat is cured in this way by the absorption of the salt. The meat is left in this way from six to eight weeks.

LARD.

CHOICE LARD to be made from leaf and trimmings only, either steam or kettle-rendered, the manner of rendering to be branded on each tierce.

PRIME STEAM LARD shall be standard when made from the head, gut, leaf and trimmings, in the proportions in which the same came from the hog, but shall not include any material which has been salted.

Much of the above matter is taken from the report of the U. S. Pork Commission of which I was a member, and the correctness of the descriptions I know from an extended personal observation.

The Apiarian.

SLATTED HONEY BOARD AND DOUBLE BEE SPACE.

PROF. A. J. COOK.

Extracted and comb honey; best package for comb honey; advantages of the slatted honey-board; its size; how to use it; double bee space; use of both; the only objection.

WHILE it is a fact that extracted honey possesses all the intrinsic excellence of comb honey, and will go much further, yet it is equally true that comb honey, because of its appearance and the fact that the comb acts as a wholesome and pleasant dilutent, will ever find readiest market. Fine comb honey is so attractive that it rarely goes begging. Extracted honey, because of its real excellence and cheapness, will surely be in great and ever-increasing demand as its virtues come more and more to be understood and appreciated, as they must be; but while the bee-keeper will have to push the sale of his extracted honey, the markets will come seeking after his beautiful comb honey. Hence, there is an incentive for every bee-keeper to study the methods of securing a fine harvest of comb honey.

Any novice can secure a good crop of extracted honey, while only the expert can secure as much of the beautiful comb. Some of our bee-keepers say they can secure only about one-half as much comb as extracted honey. Others say they can secure nearly as much of the comb. Surely, then, it behooves every bee-keeper to study the methods of comb honey production, that he may secure the most of that which sells best. One of the things we must look after in working for comb honey is to get our product in the neatest form with the least labor. There is no need of urging all to use the one-pound sections, made of the whitish poplar or bass-wood. All know that these alone can compete in the honey markets of to-day. It is just as important to keep these sections neat and clean. Of course, they can be scraped, but this is attended with labor and danger. How much better to secure our sections full of honey with the very minimum of propolis or bee-glue to mar their beauty. To do this we find the Hedden slatted honey-board just the thing. This is made exactly the size of the top of the hive; that is, the part of the hive containing the brood. If the outside measure of the hive is 14 by 20 inches, the honey-board will be 14 by 20 inches. For the Langstroth hive, I make it 13 by 19¼ inches. The slats are tacked to a rabbited rim, which, below, is in the same plane as the slats, but which projects above three-eighths of an inch. Thus while the whole under surface is flat and of the same level, above the rim projects three-eighths of an inch above the balance of the honey-board. The slats which need not be more than one-fourth of an inch wide are three-eighths of an inch apart, and are so made as to break joints with the frames below. If the frames run lengthwise, as do the Langstroth, then the slats should extend lengthwise of the hive. If cross-wise, as do Gallup frames, then the slats of the honey-board should run cross-wise. This honey-board is used between the brood frame and section case, and if any one is troubled with the queen going into the section case to lay eggs, the zinc excluders should be fastened in the three-eighths inch spaces between the slats, then the workers can go into the sections while the queen cannot. Now, if we use this honey-board in connection with the double bee space I find we secure our sections very neat and clean—often as free from stain as when freshly put into the hive.

To secure the double bee space, the brood frames should come within three-eighths of an inch of the top of the hive. That is, if the rabbits for the frames are three-quarters of an inch deep, and the top bars of the frames three-eighths of an inch thick, we shall just secure this space. Now, when the slatted honey-board is laid on to the hive we note that three-eighths of an inch is the perpendicular distance between the plane of the top of the brood-frames and that of the bottom of the honey-board, and if our sections come in a plane with the bottom of the honey case, and this is set on the slatted honey-board, we have a second three-eighths inch space between the upper surface of the slats and the lower surface of the sections. With these two spaces, even in crowded hives, the bees keep the sections mainly clean. I feel sure that no one, after once trying these slatted honey-boards in connection with the double space, will ever discard them. I have now used them three years and am more than pleased with my success.

There is just one thing that might be considered an objection to this arrangement—everything must be just right, or it does not work well. Get the space a little too deep or shallow and the bees stick in the glue and brace comb with an energy that may well discourage the bee-keeper. But why not have it just right. Accuracy should be the motto in hive-making.

Ag'l Coll., Lansing, Mich.

Farm Economy.

THAT MANURE QUESTION.

MR. STEWART'S advice as to the application of manure to the land, page 656 of the RURAL, is correct, when the soil is a heavy loam and especially a stiff clay. For years past I have practiced this method of plowing it in as fresh as possible on such land, before freezing weather comes on in Autumn; and again early in the Spring, although the application is not so beneficial then for the coming crops. But in a very sandy or light gravelly soil, I have found it best to cart out and spread the manure as fast as it is made in the stables, broadcast on the land, from November to Spring, and not plow it in till just before planting. Such soils suffer considerably when exposed naked to the sun and wind, and well littered stable manure, when Autumn weeds are not allowed to grow over them, is the only thing proper for their protection, as a mulch of leaves, straw, or hay is rolled up in heaps and more or less blown off. I could never discover leaching of any consequence from this well littered stable manure. For the use of some rotted manure for a special purpose the coming Summer, I have occasionally made a bed, about four feet thick of stable manure, from November to December, on a patch of nearly barren white sand. I let this lie there for five months or more, and yet when removed, I could not find that the sand was discolored over two or three inches deep, and that slightly; and the few weeds which grew up on this patch the following Summer, were no ranker than those on the soil alongside. This shows that it got little fertilization from the manure bed which lay there so long. Commercial fertilizers, such as guano, superphosphate, etc., leach rapidly through light soils when cultivated in hoed crops; but are very beneficial spread broadcast on wheat, rye and oats well up in the Spring, and also on grass. D.

Farm Topics.

CORRESPONDENTS' VIEWS.

THIS season among my seedling grapes, planted among the bearing vines, was a male with the sweetest and most profuse bloom I ever saw. When the Rose Bugs came they centered on this vine. To get rid of them I had only to visit this vine twice a day and destroy them; rarely was a chaffer found on any other vine among 140 varieties. The pecan trees froze to within four feet of the ground last Winter; diameter five inches. Two that barely exist have passed the Winters with sublime indifference for some fifteen years. The thrifty are all conquered by the Winter. The Japan Chestnuts had from one to three nuts in a burr, oftener one and two than three.

Bucks Co., Penn. WM. K. STAVELY.

WHEN strawberries first came we left one quarter of our mouth open to say they were "God's best gift to man." We were forced to say the same thing about cherries, raspberries, peaches, melons and grapes. Looking back over the season, it is hard to say which was the best. We have, down cellar, a can of fruit for every day in the Winter. We believe in fruit. It makes life "less of a chore"—as the old lady said. M. S.

Lenawee Co., Mich.

ALMOST every farmer has at some time met with an accident on the road. A broken shaft or trace will make bad work in a lonely place. Even those who have been troubled the most rarely make provision for an accident. I have a hook on the side of my wagon where a bunch of stout twine is always hanging. A spool of copper wire is a fine thing to have under the seat. C. H. B.

Monroe Co., N. Y.

[A "kit" or light box containing just the articles needed in case of a "break-down" is now on the market. It can be carried under the seat, and is a great convenience.]

SOME people wonder why it is so hard to induce city or town workmen to go into the country to live. It is usual to point to the crowded condition of labor in the towns and to the comparative space in the country. It is easy to say that a man could easily make a living in the country, but it is harder to do it. I find the great complaint among workmen who try to make farmers out of themselves is that they miss pay day. They have lived so long on a cash basis that when they come to try and farm for themselves, and have to pay themselves wages, they feel mixed up.

Fitchburg, Mass. S. D. L.

AN agricultural paper ought to be like a great farmers' club. Members don't go to a club simply to hear somebody preach. They can exchange ideas and get new facts from the other members. Every good farmer has some little contrivance that suits him. Perhaps he has learned some little trick about raising a crop, that is worth money to him. Let him send these things in and get others in return. Nobody could estimate the influence and value of a paper with such a membership.

Orange Co., N. Y. M. H. C. G.

"GOING TO LAW" is poor business. How many farmers would do it if they could see what kind of a country the road runs through? I never saw a law case where both parties were satisfied with the result; and I know of many where neither party could claim complete satisfaction. If the farmer could see how hungry lawyers are for fees, the kind of men who are apt to make up juries, and the long hours of worry the case will cost him, he would do almost anything rather than go to law. The great majority of cases could be settled quietly at far less cost than an appeal to "law" will bring. There are too many scrub lawyers now. They feed on the disputes of farmers. Take the work away from them by keeping cool in all disputes. "WITNESS."

LARGE FARMS IN CALIFORNIA. — Forty thousand acres in one farm! Such a statement sounds like prosperity; but is it? The lands of California were unfortunately divided into large tracts. Through the Sacramento and San Joaquin Valleys there are many farms containing thousands of acres. The routine work is plowing and seeding through the Fall and Winter; eight or 10 men, with mules, gang plows and seeders doing such work on a farm of 6,000 acres. The harvest commences in June and lasts, with thrashing, until about the middle of September. Few buildings are necessary; for the climate is such that the grain is stacked and thrashed in the field, and can be hauled from there to the nearest railroad station. The grain is handled in sacks, and elevators are not necessary. Perhaps 20 men, on the same farm, will be engaged in this work. The owner lives in some town or city; his foreman, or overseer, lives on the place. The work is done by tramp workmen who seldom stay in one place more than one season. What is the result? The soil is continuously robbed by successive crops of wheat or barley—everything is taken away and nothing is returned. Every large ranch will have its "home place" which is the headquarters of the workmen and mules; but a country divided in this way has no villages, no schools, no society, and tramps are encouraged instead of steady citizens who will make the country really rich. Many other States and Territories are afflicted with "big farms." Such a system has no place in our country, and it is a relic of feudal ages, and it must go down before the progressive intelligence of the American farmers, who work for themselves and are independent because they work. B. CHARLES.

TWINE FOR SELF-BINDERS.—It is estimated that the farmers of this country consume each year on self-binding harvesters, 35,000 tons of twine. This would make a piece long enough to go more than six times around the earth. About 1,200 feet of twine are used per acre. This should cost about 25 cents. Manilla hemp makes the best twine. It sells for more than that made from Sisal hemp, yet it is cheaper in the end. Sisal hemp breaks much oftener while running through the binder. Every break necessitates a stop. These stops in the wheat field cost time. Time is money. It pays well to get a good quality of twine.

A "SADDLE SULKY" has been invented. The axle is curved upward so that the rear of the horse comes directly between the wheels. The shafts are continuous, reaching around the rear of the horse. The seat is practically a saddle fastened by means of strong springs to the shaft. The driver thus sits with his feet resting on the shafts almost at the horse's flanks.

The Vineyard.

LADY DOWNES GRAPE RAISED IN THE OPEN AIR IN ONTARIO, CANADA.

I SENT the RURAL, by express from Detroit, a bunch of grapes to show that foreign grapes can be grown in the open air here. The variety is Lady Downes, one of the very latest to ripen. If it ripens here I think there would be no difficulty in ripening the earlier sorts. I have only one vine with a three-year-old shoot four feet high, on which were eight bunches, some of them larger and finer than the one sent, but a severe hail-storm wrecked the best of them, after which I bagged them. The bag was too small and burst with the expansion of the grapes, so that the weather got in and took the bloom off them before I noticed. The vine is trained to a pole in the open ground, and has not been manured as it should have been. It is planted slanting, so that the stem may be laid down and covered with a few inches of earth in Winter. I hope to have better specimens next year, and will bag them earlier, though bagging makes them ripen later. One bunch not bagged was fully colored a month ago. JAMES DOUGALL.

Windsor, Ont.

R. N.-Y.—The facts stated above by Mr. Dougall should be instructive to many RURAL readers. It is pretty well known that many kinds of so-called tender foreign grapes (Vitis vinifera) do not thrive in Northern climates, rather because of enfeeblement from mildew than from sensitiveness to cold. We have raised seedlings in the open grounds from the "Malaga" white grape, and carried them through the Winter with protection. The seedlings died the next year from mildew of both the stem and leaves. Now, in many localities where the soil is covered with snow during the Winter, certain varieties of the Vinifera class would do well if they were not enfeebled by mildew and if the canes were laid down and protected during the cold season. The bunch of grapes sent by Mr. Dougall is of medium size—the berries large and of very fine quality. One thing notable is that the flesh is less meaty (slightly inclining to pulp) than the flesh of the same grape raised in houses.

Horticultural.

PUDDLING AND WATERING PLANTS.

THE RURAL'S report of the Cleveland meeting of the American Horticultural Society mentions Mr. Greiner's essay on Plant Setting, but gives none of his ideas. In the Farm and Garden Mr. Greiner gives a summary of the points brought out in the essay referred to. Two of his positions as there outlined, are at variance with my practice; and one of them, I consider, to be entirely mistaken. My experience with plants is confined to sweet potatoes;

but I take it that the best treatment for them is likewise best for most other plants in the particulars to be noticed—puddling and wateriug.

Mr. Greiner says: "Plants set out just as they came from the seed bed, . . . do exactly as well as those the roots of which were dipped in water or mud before transplanting. *The famous puddling is of no account.*" The *italics* are his. It may be that an active amateur within the snug limits of a village garden, can set out plants much as they came from the seed-bed, but I do not think it is possible where the plant-setting is on a larger scale; for in any extended operations a good many plants will of necessity be out of the ground at the same time—in transit, distributed for the convenience of the planters, etc.—and if handled just as they are pulled, it is my observation that before some get in the ground the moisture will be evaporated from their roots. Even where plants have been taken out of water, in quantity sufficient for setting a short row only, I have found that in drying weather it is impossible to keep some of them from drying out. Plants are apt to die if their roots become even partially dry; while if puddled, and every care is used, many will be lost in unfavorable weather, unless they are also properly watered.

Many gardeners wait for what they call a "season" for plant-setting, but I prefer to begin when I get ready, and the plants are the right size for setting, and keep at it till it is finished, regardless of a hot sun and thirsty soil. While this necessitates watering, it insures, in my experience, a perfect "stand." Mr. Greiner finds watering a dry soil before setting of "decided advantage;" but he makes no mention of the plan of watering at the instant of setting—as a part of the operation of setting out—which seems to me by far the best. Not to go into details, this is done by partially setting the plant, using no pressure, and leaving a cup-shaped cavity around it sufficient to hold a gill or more of water, which is filled from a watering pot. The water "sets" the dirt around the rootlets and stem of the plant far closer than any amount of pressure can do it; and with strong plants, previously puddled, substantially insures growth. As soon as the water soaks away, the "cup" is filled with dry earth—called in gardener's parlance, "dusting"—which prevents the baking of the soil around the plant.

The expense of puddling I should not estimate at more than 10 cents per thousand plants. The cost of watering depends largely upon the convenience of water for loading and the length of haul. When the haul is not more than a mile and the water can be dipped out of a stream or pond directly in to the water-wagon, one man and team can furnish water for setting 10,000 plants a day. Counting 10,000 plants a day's setting, without water, for three men, it will take just four men to water and set that number in a day; which at $2.50 per day for man and team and $1.25 for laborers, makes the additional cost of setting with water, over setting without, $3.75 for 10,000 plants, or 37½ cents per thousand. The expense of watering will be somewhat reduced if a larger number is taken as a day's work. A "gang" of four men can set 16,000 plants a day, as a regular day's work; and if the water is near-by and convenient of access, one water-wagon can keep two gangs going.

Wyandotte Co., Kans. EDWIN TAYLOR.

"CONDENSED STEWED TOMATOES."

At the stores and restaurants of late we have been confronted by the above sign. Economy, convenience and extra flavor are the three points claimed for this new preparation, which is coming largely into use. Vast quantities have been put up at the canning factory of Thurber, Whyland & Co., Moorestown, N. J. By means of evaporation and condensation the bulk of the tomato is reduced about one-third, while the nutritive qualities and the full, rich taste of the fresh fruit are preserved. The "Baldwin" Tomato is used by this firm. Most of the larger canning establishments use kinds of tomatoes of their own production. A tomato for canning should be without a central seed core and possess considerable firmness and be of fine quality. Great improvements have been made of late years both in the quality of the vegetable and in methods of canning. The demand increases with the improvement in quality. Most farmers' wives seem to think they can buy canned corn and tomatoes cheaper than they can put them up at home.

"POTATO-LEAVED" TOMATOES.

The Mikado, *alias* Turner's Hybrid, is not the only tomato with the broad, potato-like leaf, as one would suppose from editorial remarks in a recent RURAL. The "Potato Leaf" sent out by Mr. Livingston the past season is quite distinct from the Mikado. It might be called a potato-leaved Acme, though with me the fruit averaged a little smaller than that of the latter. [We were impressed that this was merely a superior selection of the Mikado or Turner's Hybrid.—EDS.] In 1883 I grew a broad-leaved variety under the name of Key's Early Prolific, that very closely resembled the Mikado in foliage, but the fruit was very much smaller, and scarlet instead of purplish red. It was also called Broad-leaved Dwarf. E. S. GOFF.

THE RURAL states—page 627—that it does not know whether the Netted Gem Cantaloupe and Golden Jenny are identical. I find them different. The Netted Gem is of medium size, deeply netted, nearly round, flesh thick and of delicious flavor. The Golden Jenny is smaller and with a smoother skin. It is of fine quality. J. S. B.

Mercer Co., N. J.

Pomological.

NATIVE PLUMS.

AMONG Northern fruit-growers a good deal of interest has been developed within the past few years in regard to native plums. The kinds commonly cultivated in the Eastern and Middle States cannot be successfully grown in this climate. The fruit of the typical native is not very desirable on account of its acerbity, but it enters largely into home use where the others can not be grown, its extreme softness and non-keeping qualities unfitting it for market. Though it is indigenous to nearly all parts of the country and adapted to almost any soil, no great success has attended the attempts to bring it into cultivation. Some of the Chickasaws are attracting attention at the South, and a few Northern varieties as far as they have been tested are believed to be well worthy of general cultivation. It is believed also by our most observant fruit growers that success, with the delicious flavor and other excellent qualities of the best Europeans, but cultivation and hybridizing may yet enable us to grow varieties that will compare favorably with any of them.

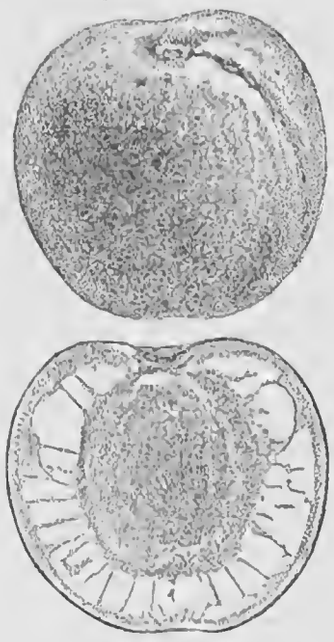
D. B. Wier, who is good authority, having had much experience, says that the finest varieties of natives he has seen, were from the woods of Northern Wisconsin. Some of the best natives brought to notice have been found on the margins of the small streams entering the Mississippi, in Wisconsin, Minnesota and Northern Iowa. Among them, the Rollingstone, as a dessert plum, deserves especial mention. It was found growing near the Rollingstone Creek in Winona Co., Minn., and has been cultivated till its character appears to be well established. The fruit when perfectly ripe is very firm and sweet, is easily peeled and entirely free from the acerbity common to other natives. The tree is perfectly hardy as to cold, an annual bearer, and bears when much younger than most other kinds. It is of low, spreading habit, fine foliage, and easily trained into a beautiful form. Trees twenty years old are still vigorous and productive.

A prominent experimenter, Wyman Elliott, says we frequently find a very good wild plum on a tree entirely worthless when under cultivation. While we have in these trees a good ground-work or starting point for improvement, it is still hoped that others will be brought to notice combining all the desirable qualities of a perfect fruit. O. M. LORD.

Winona Co., Minn.

THE ROLLINGSTONE PLUM.

WHILE I was attending the Minnesota State Fair, in 1885, Mr. J. S. Harris, Superintendent of the Horticultural Department, called my attention to what was thought to be a superior plum for a native, named the Rollingstone. There were but a few specimens on exhibition, and owing to the lateness of the season for this variety all were past the stage of maturity at which any test could be made of their quality. On August 23rd of this year I received a small package of the Rollingstone Plum by express from Mr. O. M. Lord, Minnesota City, Minn., the gentleman who first transplanted, from a grove of wild plums, the tree the fruit of which has received the name Rollingstone. When the specimens came to hand at least 70 hours had elapsed since they were placed in the hands of the express company. They were large, round, of a purplish-red color; flesh firm; flavor very good, and they were remarkable for an almost total absence of the bitterness in the skin of almost all of the so-called Canada plums. They are good dessert fruit for a native, and have characteristics from which I should judge they would probably can, preserve, or cook well. Most of the Canada plums are extremely soft, and hence poor keepers. The Rollingstones kept two weeks from the day they came to hand. This variety (see Fig. 419, with pit at 420) may be said to be a favorable sample of the best of the native plums now being cultivated



Figs. 419.

in Wisconsin, Minnesota, and Northern Iowa, a section where, owing to the extreme rigor of the Winter, none of the better varieties of the domestic plum can be grown. It has not been propagated to any considerable extent, and may be said to be untried except on the ground of Mr. Lord. The reputation it has there made has induced very many of the horticulturists of Minnesota to recommend the putting out of trees of this variety for sale, which Mr. Lord has at length consented to do.

New Jersey. J. B. ROGERS.

What Others Say.

TIN IN MOLASSES.—Director Jordan of the Maine Ex. Station, according to Bulletin No. 10, has been analyzing samples of molasses with a view to detecting the presence of tin. Of eight samples tested, tin was found in appreciable quantities in six, indicating that tin exists in molasses quite generally at the present time. The claim is made that tin is introduced into molasses in the form of the chloride (muriate), the object of its use being to lighten the color of the molasses and thus improve its appearance. It is also stated that a portion or all of the tin thus introduced separates from the molasses, the completeness of this separation varying greatly in different cases, without doubt. That which remains in solution does not seem to be enough to produce immediate poisonous effects, although it is possible that the continuous presence of tin in human food might prove to be injurious to health. Three grains of chloride of tin are a sufficient quantity to act violently upon the organs of digestion, but even if we were sure that all the tin in molasses remains in the form of the chloride, a person would be obliged to eat a large quantity of molasses at one time in order to poison himself. At the same time it is undoubtedly safer and wiser to eat molasses free from tin, and so it is considered that the presence of this metal in one of our common articles of food is a matter of some public interest. Two or three observations in connection with these analyses Director Jordan considers of importance. 1. The color of molasses seems to have no relation to the amount of sugar it contains, or in other words, to its sweetening power, or food value. The dark brands of molasses are usually cheaper than the light, so that it is economy to use the former where the effect of the color of the molasses upon the appearance of the food is not considered. 2. When it is merely a question of making food sweet, and not of securing the molasses flavor, molasses is very little more economical that granulated sugar, at present prices. A gallon of molasses weighs 11 pounds very nearly. The eight samples analyzed, contained on the average, 65.4 per cent of sugar, or 7.2 pounds to the gallon. Allowing the retail price to average 45 cents per gallon, the cost of the sugar per pound would be 6¼ cents. Nearly one-third of this sugar, however, is glucose, which has a lower sweetening power than granulated sugar, and when we allow for this fact, the cost of sugar in the better grades of molasses must be nearly as large with present prices as when bought in the form of pure granulated sugar.

EXPERIMENTS WITH FERTILIZERS.—Bulletin No. 12 gives the comparative production from different forms of phosphoric acid. Dissolved bone-black, fine ground bone and fine ground S. C. rock are used on separate plots in combination with potash and ammonia, forming "complete" fertilizers in each case. Where dissolved bone-black was used the yield of oats was at the rate of 83 bushels to the acre. Where fine ground bone was used the yield was 77 bushels per acre. Where fine ground South Carolina rock was used the yield was 72 bushels per acre. The plots not fertilized at all averaged 55 bushels per acre. Other plots received potash and ammonia only—that is, no phosphoric acid in any form. The average yield was 65 bushels to the acre. Thus the complete fertilizers with the dissolved bone-black gave an increase of 19 bushels; that with fine ground bone gave an increase of 13 bushels; while that with S. C. rock (not dissolved) gave but eight bushels' increase. Yard manure, 20 tons, gave a yield of 74 bushels per acre. We omit fractions. This is a good series of experiments. We want to know whether the increased cost of superphosphate (phosphate and sulphuric acid) pays. We also want to know whether it pays to use bone phosphoric acid, which costs seven cents a pound, or rock phosphoric acid, which costs two cents a pound.

WHEAT CULTIVATION IN SOUTH AMERICA.—It is announced that the extension of railways in the Argentine Republic has so far progressed as to connect Buenos Ayres and San Juan. This must count for a good deal in extending the area planted to wheat, and concerning which (in South America so much has been written of late In reference to this item the London Miller says that England with her narrow area and teeming population must welcome any accession to the various granaries of the world, and there can be no doubt that the Argentine Republic will enter the ranks of the great wheat-exporting countries of the earth as soon as the means of internal transit are fairly developed. The area of land available for wheat-growing is known to be of very respectable dimensions, and Englishmen may look forward to a time in the not distant future when La Plata wheat will be no insignificant factor in their supply of foreign grain.

REGISTER OF DAIRY COWS.—Robert Turnbull has been writing for the English papers a series of articles on dairy cattle. He considers the Short-horn the best dairy cow. He suggests the establishment of a herd book for pure-bred Short-horn dairy cattle. To be eligible to entry a cow must have given six times her own weight in milk in a year. G. W. Rust suggests that the American Short-horn Society open an appendix or dairy register where first-class dairy cows can be registered. Short-horn breeders have gone in wild pursuit of honors in the beef ring, but it does seem as though Nature intended the Short-horn for the "general purpose" animal after all.

GREAT WASTE OF WOOL GREASE.—At the Tanners' Convention at Boston the other day a delegate pointed out the fact that millions of pounds of wool grease are wasted annually in the United States, which could be saved and used instead of the English and French degras grease so liberally imported for tanners' use. The speaker stated that the viscous, absolutely non-drying oil or grease was being poured into the rivers of the New England and Middle States to the extent of 40,000,000 pounds a year. The woolen manufacturers are polluting the streams with it, but it is expected that loud protests will soon be entered against the practice, and then "necessity, the mother of invention," will devise some means of converting it to commercial uses. It has been proposed to treat wool with naphtha from which the grease can be recovered and purified. The ordinary method of scouring wool is by the use of alkalies, and the European degras is recovered and treated by very cheap labor, hence the low price at which it can be laid down here. Why not adopt here at once the lately discovered French method of making soap from this grease, as described in a recent RURAL.

AS OTHERS SEE US.—Mr. Grant Allen, an English writer, on returning from a recent trip to this country, made the following statement concerning American farmers:

"The farmers in the States are not capitalist farmers, but laboring farmers. The wife has to do all the cooking, housekeeping, and washing for her husband and her sons, by whom the farm is tilled, and also for the hired man if the holding is sufficiently large to justify his employment. They have less leisure than the English laborer, and they dwell more apart. They have no books excepting religious publications of a low intellectual type, and the newspaper. The result is that every one who can live in towns flies from the country as from a pest-smitten city. The overcrowding of the great urban centers is one of the most difficult problems before American society. No one will remain on land longer than is

necessary to enable him to get into the town. The unending monotony and heavy strain of the field labor have produced two ugly phenomena, of which I heard a great deal during my sojourn in America. One is the prevalence of brutal murders. On this side of the Atlantic brutal murders are usually committed in towns; in America it is the reverse. That is one phenomenon. The other is the fact that the women in a good number of cases become insane."

What do you think of the picture? Is it entirely untruthful? Would it be possible to find in this country a community in which a stranger would get such an idea from the appearance of the people?

PERIOD of GESTATION.—

	Days.	Average
In the mare	330 to 400	340
" cow	220 to 320	280
" sheep and goat	143 to 156	150
" pig	104 to 127	120
" dog	55 to 70	63
" cat	50 to 64	55
" rabbit	28 to 30	30

These periods vary with individuals and with breeds; with the sex of the offspring, the age of the dam, and her strength and condition. They also vary because of the length of the season of heat, for this may continue several days, and impregnation may occur some time after service, when the ovule passes through the Fallopian tube. This passage requires four to five days in the cow and sheep, and eight to ten days in the dog. Some animals always carry their young for an abnormal period, either shorter or longer, and this habit becomes characteristic with them. The Dutch cows are said by Professor Brown to be more regular, and to keep closer to the average period of 280 days than any other breed. A mare served by a Thoroughbred horse will go longer with foal than one served by a cold-blooded horse, and a mare goes longer with a mule colt than with a horse colt.

YEARLY COST OF A DAIRY COW.—At a meeting of the Wisconsin Dairyman's Association last Winter, says the Farmers' Review, the question how much it costs to keep a dairy cow through the year came up and a number of prominent dairymen gave their estimates of the cost. Striking an average, the amount was about $35.00 as the cost in Wisconsin. At this rate the value of the products of the cow should not fall below $60.00 per annum, or a profit, above cost of keeping, of $25.00, to make a living business for the dairyman. At this rate twenty cows would only net $500 per year. The Dairyman makes the statement that Sibley & Miller, of Pennsylvania, have learned the secret of keeping a cow a year—and well too—on $12.00. Taking the above figures—$60.00—as the value of the products of the cow, she would give a profit of $48.00, and a dairy of twenty cows would net $960 a year instead of $500, as in Wisconsin. The secret is in growing enormous crops of fodder corn on ground made rich by heavy manuring. These crops were formerly cured, but for the last two years have been converted into silage.

"THE GOOD OLD TIMES."—"I guess that all those farmers who are groaning so about low prices and high taxes and who are longing for the 'good old times' don't remember much about these same 'good old times,'" said a veteran Orange County farmer, at Goshen, New York, the other day. "I can remember," he said, "when we were compelled to haul our grain, butter, pork, and eggs all the way to Newburg, going one day and returning the next. We generally got 15 cents a bushel for oats and 10 cents a pound for butter. Seventy-five cents a bushel for wheat was a fancy price. If we got six or eight cents a dozen for eggs we thought we were doing well. Nice, corn-fed pork, dressed, we carted to market for $2 a hundred. The butter we put on the market in those days was the genuine Orange County article, yellow as gold and as hard as a walnut. I've sold tubful after tubful of butter for 10 cents a pound that would not me 75 cents easy if I had it, or any like it, to sell now. That was long before the Erie Railway came through here and put us up to selling our milk instead of making it into butter. We didn't have any lime-preserved eggs in those days to sell, either. As for taxes I paid $100 on my farm of 100 acres when I was getting only 10 cents a pound for my butter. On the same farm now I pay $42.50, and my dairy brings me the year round what is equal to nearly three times ten cents a pound for butter. There is a great deal of humbug, I tell you, in this mourning for the good old times, and I know it."

MILK AT LESS THAN ONE CENT A QUART.—Experiments have been made at the Massachusetts Agricultural Experiment Station to determine the cost of a quart of milk when feeding various kinds of food in different combinations. These consisted of bran, shorts, corn meal, gluten meal (the refuse from glucose factories), hay, corn fodder and corn silage. The result is reported as follows: In feeding the bran, or shorts, corn meal and gluten meal, 3¼ pounds' weight of each was used. Two of the foods were also combined, making 6½ pounds to feed each cow daily, and at times a combination of three kinds was used, making 9¾ pounds' feed daily to each cow. The remaining food was either hay, dry corn fodder or corn silage. The highest amount of hay eaten by any cow in one day was 20 pounds, and of silage 55 pounds. The apparent bulk of the silage over the hay, as shown by weight, may be explained by the fact that the hay is dry while silage is juicy. The highest cost of milk per quart was from a liberal hay and grain feed, being 2.03 cents per quart. The milk produced at the lowest cost was from a moderate feeding of silage and corn meal, and was but .83 cent per quart. It may be noticed, therefore, that a quart of milk produced by feeding hay and grain costs as much as 2¼ quarts produced by feeding silage and corn meal, and so far as the quality of the milk was concerned under the varying conditions of feed given, no serious alteration in its composition was noticed.

M. CHARLES GIRARD, chemist of Paris recently amused himself by investigation of the ingredients of a beautiful red currant jelly charmingly put up for export to the United States. There was not an atom of fruit in the mass, as was demonstrated by the adding to it of methylated alcohol, which would have turned it green had it contained any fruit acid. It was found to consist of gelatine, sweetened with glycerine residue, colored with pichsine (a poisonous mineral extract) and flavored with no one knows what. A great many people in this country imagine no currant jelly so good as that which is imported from France.

TRUE INWARDNESS.

AT the recent London Dairy Show, the prizes went to the cows giving the largest yield of richest milk. There is naturally some fault found with this system of judging. The cost of production should always be taken into account. A cow that gives 20 quarts of milk with a profit of only five per cent. on the cost of feed, is less profitable than one that gives 15 quarts with a profit of 10 per cent. The best cow is the most profitable. Reckoned in this way, some of the smaller breeds will beat the larger.

MR. ROBERT DOUGLAS, of Waukegan, Ill., has done a great deal to bring the merits of the Wild Black Cherry (Prunus serotina) before the people, both East and West. He says it grows rapidly in all the tree-bearing territory east of the Rockies, and this can not be said of any other forest tree of so much value.

MR. GREGORY, in the Weekly Press, says no one can keep squashes to advantage until he has learned to keep the temperature of the storehouse near the freezing point. The great desiderata are a low temperature and a dry air.

MR. HENRY STEWART, who has had some experience with sheep in North Carolina, has found that they go through the Winter better after having been sheared, and stand the cold rains and storms better than with a thick fleece on them. Some pure Cheviot sheep suffered severely with their fleece five or six inches in length, and some of the ewes were unable to rise on account of the weight of the water in the wool after a night's heavy rain. With a thin fleece the water is shed and shaken off, and the sheep do not suffer from the cold. Hence fall shearing, even of the spring lambs, Mr. Stewart thinks, is good economy.

THE cow must be kindly treated or the milk is poisoned, says George T. Angell. Milkmaids who can sing while milking are paid a higher price in Switzerland than those who cannot.

ACCORDING to the Government returns there are in Great Britain about 900,000 agricultural laborers, farm servants and cottagers. About one in 50, namely, 17,302, have either a run on a farm for a cow, or land on which to keep a cow.

HERE is what Professor G. T. Brown, professional head of the English Agricultural Department, says of inoculation in connection with contagious pleuro-pneumonia among cattle. "If inoculation is practiced at all as an alternative to slaughter in the case of cattle which have been exposed to the contagion of pleuro-pneumonia, but are not discoverably affected, the inoculated cattle should be kept in the infected place until they are in condition for the butcher, and the infected place should not be declared free while any of the inoculated cattle remain alive." It will generally be agreed, after this declaration, that stamping out is the easier way of getting rid of the disease.

THERE are several reasons, Mr. Stewart says, why any practical dairyman will use salt dry and not dissolved in brine for the purpose of butter making, but the greatest of all is the simple fact that butter cannot be salted with brine unless the liquid is actually mixed with it, and this mixture of water would be an adulteration and a fraud upon the consumer.

AT the Rural Grounds we are now (Oct. 25) eating the new pear Dr. Reeder. It is medium in size—larger than Seckel and otherwise, as to appearance, much the same. In quality it is more juicy, less sweet, not quite so fine-fleshed, but more sprightly. The tree has borne a very fair crop.

A CLASS in vocal music or a singing school is an excellent thing for rural neighborhoods during the Winter, says the Orange Co. Farmer. Music and books will make the poorest home brighter.

A WRITER in our esteemed contemporary the Chatham Courier, asks farmers to consider whether they lose or gain by allowing their buildings to go unpainted; whether they lose money by giving their stock and swine good bedding and comfortable winter-quarters; how many of the needy poor might be fed with the grain that is eaten by rats and mice?

THE Western Agriculturist says that many experiments have been tried in Germany for the purpose of discovering whether pure water, taken in large quantities by animals which are being fattened, is favorable or otherwise to the process. The conclusion come to on this question is that water introduced in large quantities into the digestive organs increases the elimination of carbonic acid by the animal, and consequently hinders the formation of fat. When cattle are to be fattened, therefore, no more water should be given to them than is necessary for diluting the food and quenching thirst.

IN some parts of England Prickly Comfrey is said to be a first-rate food for pigs. Mr. James Howard, in the Journal of the Royal Agricultural Society, says that even well-fed pigs are exceedingly fond of comfrey and that it is the best of green food for them. This is important. Comfrey will yield an immense amount of leaves and a constant supply of them.

THE Sanitary Committee of the Port of London report that while very small quantities of frozen meat are constantly condemned as unfit for food, many large lots come to hand in a condition to warrant this procedure. It has always been supposed that Australian frozen meat was sure to reach England in a fine state of preservation. This does not look like it. Bad eggs are hardest to detect by the Board of Health officials. Many decayed eggs are sold simply because there is no practical test for large quantities.

GOV. ROOS, of New Mexico, in his annual report to the government, recommends "a system of storing basins at the heads of the several streams" to save a vast amount of water for irrigating purposes. "This would reduce to cultivation many millions of acres of productive land now barren and desolate."

As an instance of the advantage of using a pure-bred bull, rather than even a good grade, the National Live Stock Journal tells of a farmer who by using a good grade sire has been enabled to turn off three year-old steers that average close to 1,100 pounds, while one in the lot, of the same age as the others, and treated in the same manner, but sired by a pure-bred bull, weighed close to 1,300 pounds, or a gain of nearly 200 pounds through the added quality of the sire alone. This steer dressed 80 pounds more than the best four-year-old he had marketed during the same season, and dressed 206 pounds more than two car-loads of the progeny of grade sires averaged.

THIS is the way an English farmer prepares food for his work horses:—Hay 400 pounds, corn 300, oats 200, beans 100. The hay is cut and the grain is bruised and all mixed together. From 20 to 24 pounds of this mixture form a daily feed for large horses.

PROFESSOR GLEASON'S advice is good, viz.: Never to say "whoa" to a horse except when you want him to stop motion at once. If you merely want him to slacken his speed, say "easy" or "slowly" or "steady".

SELDOM is either party to a great lawsuit satisfied with the result, says the Cultivator. Even to the one who obtains a favorable verdict, the long list of expenses, vexatious delays and uncertainties more than offsets the fruits of victory.

A WRITER in the Breeder's Gazette says of the milk of Holsteins that it takes the cream longer to rise than it does from the milk of other breeds; that Holstein milk is more dense and does not sour as soon as other milk; hence this quality is particularly valuable to the milkman and cheese manufacturer; that Holstein milk is remarkably rich in casein, the cheese basis; hence for the production of cheese it has no equal; that Holstein milk is rich, and has a good body even after it has been skimmed.

THERE seems little doubt that Prof. Wiley's experiments to manufacture sugar from sorghum cane by the diffusion process have proven successful.

Everywhere.

TRANSCONTINENTAL LETTERS. LXVIX.

MARY WAGER-FISHER.

Still in the Grand Canon; length and hight of the cañon; scenery and climate of the cañon; view from Prospect Point; Solomon's Temple; the Pyramid; Babel's Tower; Sunset Peak; other striking features; growing grandeur; the start to the train.

ON the following morning we went in quite an opposite direction from the Diamond Creek Cañon, and after a walk of three-quarters of a mile from the hotel we reached the Colorado River, which, at this point, is 320 feet wide and varies in depth from 150 to 225 feet—a muddy-looking stream and one upon which I should not like to venture in a boat. The entire length of the cañon is 325 miles, and the highest cliffs—called Aubrey Cliffs—rise to a hight of 7,800 feet, and it may serve for comparison to bear in mind that 5,280 feet constitute a mile. The cliffs in the Diamond Creek do not rise much above 3,000 feet, and in some places they rise nearly, if not quite, to that hight, perpendicularly, and to the very top, in the crevices, grow cacti or some variety of vegetation. We went up this cañon for three miles, and in this distance saw but one waterfall, and that not high. Anaximander and Farlee climbed to the top of the cliffs at one point, and enjoyed an outlook over the surrounding country. Pedestrianism at no time in the Diamond Creek Cañon is particularly difficult when one is equipped with stout boots and a dress suitable for such a tramp. There are no bridges or ladders, and for a good part of the way one could go on horseback. The air is delightful—one can walk a great distance without any sense of fatigue.

Radiating from the spot where the rude hotel stands, the cañon in every direction is open and sunny, and of considerable width, filled with a sandy soil in which grass and flowers grow, and thickly planted with boulders. It would seem that here at one time a mighty stream must have flowed, where now there is only the shallow Diamond Creek reinforced, maybe, by the even less significant contribution from Peach Spring Cañon, and in order to enter the Diamond Creek Cañon proper, or to reach the river, one must traverse this open sunny plantation of rocks. The shore of the river is deep sand, and in it was growing and blooming a most exquisite white ubronia. Farlee said it bloomed there the entire Winter, and the year round, as well as various other flowers. The temperature varied but slightly in the course of the year—there was neither dampness nor dew, but a marvelously pure, dry air at a low altitude, and he grew enthusiastic over the future of the cañon when it should become the great resort of invalids in need of just that kind of a climate. As dry air usually can only be had in high altitudes, the cañon certainly has a claim on the attention of people who demand a peculiarly dry atmosphere, and still cannot endure the nervous strain produced by a high altitude. However, on that morning, Farlee was particularly desirous that I should climb to Prospect Point—a hight 1,500 feet above the river level, whence we could take in all the great features of the cañon. It was a most fatiguing scramble, Farlee going ahead and reaching down a hand to pull me up the declivities. The laddie climbed on his hands and knees, and ere the day was done he was in tatters like the ideal beggar. All the way up we found an abundance of new and beautiful flowers—never failing to gather specimens—and on the very top of Prospect Point I found masses of the exquisite Mariposa Lily—its large, mauve-colored cup spotted with red and brown. On the top we added stones to the cairn already there—wrote our names on a slip of paper which went into a bottle kept there for the purpose, and sat down to wonder and to gaze. Farlee sent out some of his tremendous screeches—we all screamed ourselves hoarse, to hear the echoes carried from peak to cliff and back again.

So far I have led the readers of these letters concerning this cañon on a rather unentertaining scamper I fear, for the sole reason that the great features of the cañon are indescribable by pen, photograph or pencil. Moreover, they grow hourly in magnitude. The longer we looked at the cliffs, the walls, the enormous rock exposures, eroded ages ago under water,

shaped into marvelous and superb architectural forms by the action of the water, and then slowly lifted by the hand that made the world to their present hight, the greater they became, until the scene was overwhelmingly appalling.

From Prospect Point we could see these enormous rock structures—as we could in part from Diamond Creek Cañon—from base to to summit. They were all very near to us, apparently within a few rods. We could note their foundations of granite or trap rock, count the horizontal strata, then the talus, then the strata, the corners of each great piece sculptured into bastions with wonderful exactitude, the facade diminishing toward the top where the structure ended may be in a perfectly shaped pyramidal peak in the center. Some of the facades were curiously sculptured. On one were the colossal figures of an elephant and owls, standing out in bold bas-relief The principal architectural forms have from time to time been named, and for the most part fitly. One goes by the name of Solomon's Temple. Its actual hight is 6,250 feet above the level of the river (the river is 1,130 feet above the sea), and the estimated width of its facade is from two to four miles. Try to imagine a stone structure of perfect proportions and of beautiful workmanship, over a mile high and correspondingly wide! The peaked cupola on the top—we could see from this point, as we could not below—was the face of a ridge or wall running back, Farlee said, for 15 miles. Another piece called the Pyramid, because of its shape, rose to a hight of 4,200 feet. Babel's Tower, a structure with beautifully sculptured buttresses, was majestic in its hight of 5,000 feet.

"Sunset Peak" has not been accurately measured, but its hight is reasonably estimated at 6,000 feet. After the sun has set and not a ray of sunlight can elsewhere be detected, this peak reflects a golden glow; a point of glory away up against the clear, blue sky. One group is called the "Castle on the Rhine" and is 5,000 feet in hight, and other equally notable portions are yet unnamed. On none of these great ruins, cut and shaped into distinct and separate structures, was there any vegetation—may be an occasional spear of grass—but on the cliffs running landward from the river trees grow abundantly. From where we sat, the river below looked but a slender stream that we could leap across, and innocent enough of ever having had a part in fashioning the tremendous scene we gazed upon. If the talus were removed from above each layer of rock strata each would present, to a very considerable degree, a succession of enormous steps from base to summit. Farlee related to us some of his experiences in reaching the top of one or two of the highest structures—one hardly knows what term to apply to these abodes of the giants; in any case an exceedingly daring and perilous undertaking.

It was two in the afternoon when we reached the hotel—the descent being as fatiguing as the ascent—and Farlee said that we should be off for the station not later than four; but it was a half hour later when we started. I was too tired to move with my usual expedition, and then I dreaded the hot sun in the long ride ahead of us, quite forgetting that we were to be in the shadow of a mighty wall, and things more wonderful than any we had yet seen were to come into view in that outward drive.

"It will be eleven o'clock when we reach the station," said Farlee; "but we must reach Westminster Abbey before dark."

Fortunately Pop and Rowdy were fresh for their long pull. Farlee, who had spared himself in no way to serve us, was still in the best of humor. The sky was cloudless, but bats had begun to fly in the evening air.

RURAL SPECIAL REPORTS.

Connecticut.

GALES FERRY, New London, Oct. 27.—Hay here about an average crop. Corn fair. Potatoes owing to drought mostly a failure; Apples set well but nearly all fell off. Eggs 28 cents a dozen and scarce at that. W. M. W.

Illinois.

ELGIN, Kane Co., Ill., November 1.—On the Call Board to-day butter was slightly lower, with heavy sales at 26 to 27 cents; over 200,000 pounds sold; the lower price made a fairly active market; receipts continue large. Cheese quiet but firm; full creams 10 to 11 cents; half skims three to eight cents, with fair demand. L. R. M.

Indiana.

MILFORD, Kosciusko Co., Oct. 26.—Our wheat crop was a failure on account of the fly. Corn a partial failure on account of drought; what there is is badly blown down. Oats a good crop. Potatoes an average one.

J. B. A.

Michigan.

OVID, Clinton Co., Oct 24.—Old Michigan is doing her best to equal her Southern sisters by way of second crops of grain, fruit and flowers. This season we have a second crop of oats two feet in hight all headed and well filled; hills of strawberries with six to eight large ripe berries, and apple trees with ripe fruit and blossoms on the same limbs. Wheat is making a splendid growth. I have five acres of the Surprise and D-M Wheat sown this Fall, that is now as thick as a mat and five inches high. The Shumaker sent out in the Rural Free Seed Distribution a few years ago, does very well here, growing a long straw; but it falls down badly. A. F. B.

New York.

UTICA, Oneida Co., Nov. 1.—The first of the Winter months finds no falling off in cheese as was expected, but total sales of 11,394 boxes ruling at 11¼ cents, or 2,820 boxes more than last week, ruling ⅜ cent higher. The market was active and fairly a surprise, being firm at the opening and vigorous at the close. This was owing to the buyers having largely disposed of their surplus in shipments, and the anxiety of the sellers to get their October cheese, which is of fine quality, on the market. Little Falls sold 7,692 boxes, ruling at 11½ cents. It was a strong market and a slight gain in sales. The butter receipts were about 150 packages, the general market being a little weaker but prices about the same for best makes. The quality last week has been improved. The best will probably be brought out for the holiday trade. Little Falls to-day sold 100 packages dairy at 20 to 23 cents, and 25 packages creamery at 24 to 25 cents. Prices here about the same. Hops—All is quiet and nothing reported save a few damaged '86s at 16 cents. R. L.

Tennessee.

WARTRACE, Bedford Co., Oct. 27.—We have been having a most remarkable Fall. We had no rain in 40 days, which has much retarded the coming up of wheat, and caused a large per cent. to be parched by the hot sun we have been having throughout this month. Acreage about the same as last year, most of the land having been turned before dry weather set in. We had frost on October 2; but none since, so that corn ripens very slowly. It is an average crop; price 35 cents; wheat 70 cents; apples the least crop for years. Of peaches we had none. Hogs are scarce and still dying with cholera in some sections; price $3.50 per 100 pounds; shoats $3.25 per 100 pounds. Cattle are only worth $2.50 for best butcher's, while $2.00 is the average price. W. S. W.

Virginia.

RICHMOND, Henrico Co., Nov. 1.—At present it is only safe to say of tobacco, that for fine wrappers, cutters and smokers the market is stronger. The prices paid for common stock are low at 1 to 2½ cents in the interior markets and 3¾ to 8½ cents here, but standard, fine and desirable bright new tobaccos are selling high wherever offered in this State and North Carolina, white wrappers reaching as high as $1 per pound, and fancy at 37 cents and over. Holders of good old bright leaf believe in much better prices still, but a slow rally in prices is probable. Planters are advised not to send to market any new till there is a better chance to sell, and old stocks are reduced. Sun-cured leaf is more active and higher. A fair business has again been done in Western burleys for home manufacturing at 4 to 8½ cents. The exports of manufactured tobacco from this district have been large, and were over 400,000 pounds, from Petersburg, Va., for the month of October. W. E. D.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

JAPAN CLOVER; TREATMENT OF MUCK, ETC.

G. G., No. White Sulphur Springs, Va.—1. How much Japan clover seed should be sown to an acre? 2. At what season should it be put in? 3. Will it yield anything of a crop of hay? If sown in woodland shaded much by trees will it flourish? 4. Where can seed be got and at what price? 5. How can a quantity of tenacious black muck from a swamp, apparently with a lot of vegetable decomposed matter in it, be best utilized as a top-dressing for meadows? I have been advised to mix lime or kainit with it; would that be advisable? 6. What kind of a mower is the Eureka?

ANS.—1. We do not know, but should sow about the same quantity as of clover seed. 2. November for your section. 3. Our friend is referred to page 656 of the R. N.-Y. of Oct. 2. On rich, damp soil, it will grow a foot or 18 inches high. But the leaves are small and the stems are too woody for hay. On sandy soil it is low-growing and procumbent in habit. This plant is spoken well of by certain farmers in Louisiana. "It will grow and form a sod on the thinnest land," they say, "and even in the roads and naked places where nothing else will grow." Still, we should advise caution in sowing it except as an experiment. The writer of this has seen it in North and South Carolina on thin, hillside land, and its growth was by no means luxuriant. We are not aware that it would thrive in woodlands. 4. A. P. Rowe, Fredericksburg, Va., will inform you where the seed can be purchased. It was sold last year at eight dollars per bushel. 5. Yes, mixing it with lime would be as good a way as any to break it up—a few bushels of refuse lime to a cord of the muck; mix both together and keep in good condition to shed rain; or mix at least a bushel of fresh lime with a ton of muck. The lime hastens decomposition, and until the muck is decomposed, it is of little or no use. It would be well to mix kainit with it if potash is desired. The salt and potash would also act as a solvent and hasten the period when the muck could be best utilized for the purpose required. 6. The Eureka is a first-rate machine. We decidedly prefer it to the side-cutting mowers. The cutter-bar is directly behind the horses and in front of the driver. We are not aware that it runs more heavily than the side-cutter. At all events a pair of ordinary farm horses have served us well enough for the past five years.

TESTING COWS FOR CREAM AND BUTTER.

W. C. H., Shrewsbury, Mass.—What is the best way to test cows for cream and butter, and what should be the grain feed during the test?

ANSWERED BY H. STEWART.

Testing cows is a particular business, and to be of any use the test should be made systematically and with precision. The cow is fed in the ordinary manner, and the food is weighed and measured as well as the product, twice a day for a week, as a beginning. It should be done accurately, and the feeding and watering should be done at regular hours. Then the food is increased by regular steps one week at a time. The hay or coarse fodder is kept constant, but the various grain foods, as bran, corn meal, cotton-seed meal, pea meal, or other substances which may be given, are increased week by week. In my own tests, I have made five pounds of cut hay per meal, three times a day, the standard of this fodder, and the standard grain food has been made up of 200 pounds of corn, 100 pounds of oats and 100 pounds of fine bran—wheat or rye—all ground together; of this eight pounds per day have been the regular food, three pounds being given with the cut and moistened hay night and morning, and two pounds of dry with five pounds of dry hay at noon. To this standard ration various additions may be made, but I have had the most and best butter from the addition of four pounds of fine ground corn meal and two pounds of cotton-seed meal per day, given in two meals—morning and night—half at each meal, in addition to the regular ration. For a working dairy this is as highly as a cow can be fed with profit as a steady thing, and then watchfulness must be exercised lest any untoward accident may bring on an attack of gurget. The only use for testing, is to find how much food can be given to a cow with profit—not how much can be given without killing her. And this business way of testing cows should be a part of the regular management of a dairy until the capacity of each cow is found, and then that should never be exceeded.

COTTON-SEED HULLS AS A FERTILIZER.

G. B. K., Mobile, Ala.—Would cotton-seed hulls among which there are some seed grains be a good fertilizer for Irish potatoes or other vegetables? Would it be a good way to make a compost of them with an equal amount of fresh horse manure in alternate layers, putting a cord of compost on eight drills 200 yards long, and then using as a top-dressing 200 pounds of cotton-seed meal and 200 pounds of cotton-seed hull ashes?

ANS.—A fertilizer for potatoes needs to contain lime and phosphoric acid chiefly, with some potash. Cotton-seed hulls are rich in potash, phosphoric acid, and lime, their ash containing 23¾ per cent. of potash, nearly 8 per cent. of phosphoric acid, and 30 per cent. of lime. It would be a good plan to compost the hulls with horse manure, but the addition of some leaf mold or black soil from the woods or a swamp would be beneficial, as the dryness of the manure and the hulls would cause the compost to heat vigorously, unless it was watered occasionally. No doubt the manuring described would be advantageous to the potato crop. The drills 200 yards long would cover about one-third of an acre, hence the cord of compost would make a very fair manuring with the cotton-seed meal and the ashes. These should be sown evenly on the harrowed ground before planting; the planting will mix them with the soil.

FATTENING HOGS ON TURNIPS, ETC.

B. R., Jr., Abilene, Texas.—I am in the droughty district and all crops were a failure. I have 25 hogs which I want to fatten in the cheapest way possible. I have a large crop of turnips. Would it pay to boil them and mix with them some cotton-seed meal (worth $1 per 100 pounds) and wheat bran (worth $1 per 100 pounds)? What proportion would be best? 2. Would cotton-seed meal and bran be a good fertilizer for vegetables?

ANS.—1. The mixture proposed would be excellent for the hogs; but there is no necessity to boil the turnips. These may be chopped up; a spade with the edge ground sharp cuts very fast in a shallow box about six by eight feet. For 25 head of hogs six bushels of turnips may be chopped for a meal. This can be done in about three minutes in the manner mentioned, then two pounds per head of bran and half a pound of cotton-seed meal may be sprinkled over the cut turnips. Two meals a day of this kind would fatten hogs very soon. The quantity of cotton-seed meal mentioned should not be exceeded, as this meal is exceedingly rich food. 2. Yes.

GRAPES FOR THE SOUTH.

W. T. T., Salisbury, N. C.—1. What is a good, hardy, prolific grape that will ripen 10 days or two weeks later than the Concord? 2. Will Brighton and Moore's Early bear transportation to Northern markets? 3. What is the best time to apply ground bone and ashes to bearing grapes, and how much per acre? Soil, sandy loam with clay subsoil.

ANSWERED BY T. V. MUNSON, OF TEXAS.

1. The Triumph has proven the best late variety tried here. It is a fine, large table grape. 2. Moore's Early and Brighton carry quite well to market, but the latter rots severely. 3. Apply ground bone and ashes early in Spring when cultivation begins, and cultivate in after having been sown broadcast at the rate of 500 pounds of bone dust and one ton of fresh wood ashes to the acre. A few hundred pounds of lime would be excellent on sandy soil, in addition to the ground bone and ashes. Compost manure and leaves would also be excellent for such soil.

DANGER FROM COPPER EVAPORATORS FOR CIDER.

H. S. K., Cavendish, Vt.—1. What is the best way to clean a copper evaporator used in making cider jelly? 2. Is there any danger of poison as long as the cider keeps the pan bright?

ANS.—1. Wash the copper bottom with cider vinegar and then thoroughly with hot water and rub dry with a clean cloth. The cider may then be boiled without danger if it is sweet, but not otherwise, as the acid would produce acetate of copper or verdigris, which is very poisonous. 2. Yes, the brighter the cider keeps the copper, the more danger there is, as the bright surface indicates that the copper is being dissolved, and the cider is acquiring a decidedly poisonous character.

TOBACCO STEMS AS MANURE.

C. C., Warrenton, N. C.—What fertilizing elements do tobacco stems contain? How should they be prepared for manure?

ANS.—Tobacco stems contain a large quantity of fertilizing matter. When dried they have nearly 20 per cent. of ash, or 200 pounds in 1,000 pounds, and these 200 pounds of mineral matter consist of 54 pounds of potash; 7¼ pounds of soda; 20½ pounds of magnesia; 73 pounds of lime; 7 pounds of phosphoric acid; 7⅜ pounds of sulphuric acid and 8¾ pounds of chlorine, and 9 pounds of silica. They are therefore an exceedingly valuable fertilizer on this account, without considering a large but undetermined amount of nitrogen which they contain. They are best composted with cow manure, or some other moist matter which will help to decompose them. A large quantity might be spread on the land and be plowed in.

SELLING PLANTS NOT TRUE TO NAME.

"A." Baraboo, Wis.—Three years ago I ordered from B. 72 Worden grape-vines. When they began to bear fruit they all proved to be Janesville. Wordens sell here at from 6 cents to 12 cents per pound; the others are worthless. I shall, therefore, have to take out these vines and plant others. Should not the nurseryman pay not only the original price of the vines, but also damages for three years' loss of time in selling the crop?

ANSWERED BY JUDGE WILLIAM PARRY.

A. has been sadly disappointed, and possibly he has sustained a loss by the plants not proving to be Wordens; but it would be impossible to estimate the prospective value of the plants or fruit had they been Wordens, or the damage sustained by their proving to be Janesvilles. B. should, however, be required to furnish genuine Wordens to the amount of the price of the spurious plants, and if the Wordens at the time of purchase were worth more than their market value now, the difference should be placed to the credit of A., and stock of his selection should be furnished at market rates to balance. Most nurserymen, where such errors occur, are willing to settle in this way, which is generally satisfactory to the purchaser.

R. N.-Y.—The decision of Judge Parry seems rather unfair. Owing to B.'s mistake in sending plants not desired, A. loses three years of time. It would unquestionably be difficult to decide in dollars and cents what this loss would be equivalent to; but there ought in justice to be some compensation beyond replacing the Janesvilles with Wordens. Suppose the *second* lot of vines proves to be other than Wordens; A. would then be obliged to wait three years more.

Miscellaneous.

J. P. M., Somerville, N. J.—1. Four years ago I planted some Fay's Prolific Currants; year after year they continue to keep the tree form: no sucker or cane has ever grown from the roots. The growth of wood too is comparatively small; while the new wood often bends towards the earth. Would planting the cuttings tip end down produce such an effect? 2. In August last I bought and set out 400 potted strawberry plants, the ball of earth surrounding each plant not exceeding the diameter of a broom-stick, consequently the roots were small and weak. As a result, more than half the plants have been lost. What is the size of the pots generally used for this purpose? 3. The plants referred to were well soaked three times and slightly covered with long straw to partially shield them from the sun; was this right?

ANS.—We doubt whether it would make any difference in the habit of a bush or vine or tree whether the cutting was rooted one way or the other. That the currants have not formed suckers is no doubt owing to some injury which the lower buds or shoots have received. The Fay is a sprawling grower—more so than the old Dutch, but no more so than the Grape or Cherry Currants. 2. A nurseryman should be ashamed to send out such stuff for "potted" plants, and our friend ought to have returned them. The object of potting plants is to secure an abundance of roots and also of of soil, so that when transplanted, the plants will continue their growth. A three-inch (diameter) pot is none too large. We have never favored "potted plants" even though well and properly grown, but the stuff that is often sent out as such is simply an imposition. 3. Yes; that was right certainly.

W. C. H., Shrewsbury, Mass.—Is this a good feed for milch cows: two pounds of middlings and shorts mixed; two pounds of linseed meal (new-process) and two pounds of gluten meal?

ANS.—Gluten meal is a rich food. It is the nitrogenous part of the corn left after the starch has been taken out. But as linseed meal is also rich in gluten or albumen, and the shorts contain also a large proportion of gluten, this feed is not a desirable one excepting for some special purpose. At least two pounds of corn meal should be added in place of one pound each of linseed and gluten meal. This would make a better balanced feed for a cow giving milk.

M. F. McC., Darlington, Pa.—Can I get a cement for repairing cracked ironware, like pots and kettles?

ANS.—Stove dealers do not know of any such cement. The Scientific American gives the following as a cement used for large steam pipes: Litharge two parts, powdered slaked lime one part, sand one part. Mix the mass with a sufficient quantity of hot linseed oil varnish to form a stiff paste. This cement must be used while fresh and warm.

T. M. Raymond, Dak.—Last Spring I bought some Saskatchewan seed wheat and sowed it; the grain I harvested from it is considerably shrunk. Would it pay to use it for seed next Spring?

ANS.—Yes. It will germinate, grow and yield just as well as unshrunken kernels.

F. H. H., Manchester, Va.—At what stage of maturity should black cow-peas be plowed under to give the greatest advantage as a fertilizer?

ANS.—The cow-pea of whatever variety it may be, is at its most useful stage for plowing in or for feeding when the blossom is fully matured and faded, and the seed is beginning to form.

C. C. P., Naples, N. Y.—We have not before seen the bean you send for name. Probably it is a new cross.

A Reader (address mislaid), asks about the preparation of pickles.

ANS.—First soak the salt pickles in water long enough to take all the salt out of them, (this can be done quickly by changing the water often); then pour in vinegar to cover them; spice to suit taste Some people prefer to use hot vinegar.

DISCUSSION.

WORDEN, CONCORD AND SOME OTHER GRAPES.

E. P. P., CLINTON, N. Y.—The reports from the Rural Grounds often surprise me—last of all the comparison of Worden and Concord. I have the best grape situation in Central New York—a swale facing southeast and perfectly drained. Now in this vineyard of mine, Worden was in good condition for eating two weeks ahead of Concord. It is a superb grape for this reason, and also because it is agreeable for the table even though not entirely ripe; while a Concord is abominable till dead-ripe. The flavor of the Concord and Worden are certainly decidedly different. I could surely not be deceived in the dark about them. The Worden I sold readily for seven cents; the Concord for from three to five. There is nearly double the difference in profits owing to time of ripening. But, say what any one will, we have not yet outlived Rogers's Hybrids: Massasoit, Agawam, Lindley, No. 30, Gaertner, Herbert are among our very best grapes, and likely to remain so. I agree with the RURAL about the Niagara—it is wondrously taking, but it is not a very superior grape in quality. Pocklington is a very fine grape, when perfectly ripened, which it seldom is. Duchess needs a little winter care and is a magnificent affair. Grapes are hardly ever eaten when dead-ripe, hence all sorts of opinions. Martha as marketed is only tolerable, but let it hang on the vines till the last of September and then try it. Lady is good on August 25th; but let it hang till September 10th, and each berry is a bag of honey. Yes, plant grapes; only plant lots of them, so you won't have to eat them green. A small vineyard well cared for is less trouble than two or three sprawling vines.

R. N.-Y.—What we stated with regard to the Worden was the result of careful comparisons between it and the Concord. We are told by Mr. E. Williams, who gave us our vines, and who is confident it is a true Worden, that this variety is liable to change as it grows older. This may prove to be the case with our vine at the Rural Grounds. Our correspondent must have noticed that there is a great and unaccountable difference of opinion as to the Worden.

J. T., NORTH MADISON, Ind.—In reading the RURAL's description of the Fastigiate Oak trees on the Rural Grounds in a late issue I was led to think some slight mistake had been made. "Ten years ago two were planted; one died; the other is now 30 feet high, though scarcely more than six feet in diameter. For narrower portions of the lawn where paths or roads converge and there is little space for trees, the Fastigiate Oak is just the thing." It appears to me that for its age it is a tall oak. As to the diameter—six feet—you must be a little off; maybe you meant inches. As for a six-foot tree being suitable for a small space in a lawn, you must be a little off there. In this country a six-foot oak or poplar tree is a rarity. Four-foot trees are now scarce, and they are 100 to 120 feet high.

R. N.-Y.—Why our friend should take for granted that the stem or trunk is referred to when neither word is mentioned, while the leaves are spoken of, is not quite clear to us. At any rate, we alluded to the diameter of the entire tree.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, NOVEMBER 13, 1886.

The man who is capable of allowing himself to be influenced by a hint, without waiting for a kick, is to be congratulated. Such men are not so plentiful as they should be. We see a good many barns with unfilled cracks, with loose boards, or leaky roofs. There are plenty of houses that need banking up, plenty of windows that let in the cold, and plenty of ill-fitting doors. The sharp frosts that come in at this season constitute a hint that ought to be heeded. Those who do not heed it will wait for the kick, which will come in the shape of a rousing storm later in the season. Then there will be a rush to do the work that should be done now. It will take twice as long, and a good deal of property will be destroyed before it is done. Learn to appreciate the value of a hint.

Nothing of importance has yet been done towards stamping out contagious pleuro-pneumonia in Chicago, and there is a good deal of danger that this careless dilatoriness on the part of the authorities will beget a careless disregard of danger on the side of the public. Already there are numerous indications of the growth of such a sentiment. The presence of the disease in the city is likely to prove injurious to the fat stock show, as the owners of fine stock elsewhere will very naturally be reluctant to risk danger of contagion by sending them to the exhibition. The Ohio Live Stock Commission has ordered that all cattle sent from that State to Chicago, to be exhibited at the show or for any other purpose, shall be subject to quarantine for ninety days at the owners' expense before they are permitted to return. Other States are also pretty sure to take similar precautions.

Over 15,000 men are on strike at the Chicago packeries for ten hours' pay for eight hours' work. To show what the men are losing by remaining out, the payrolls of two firms show that one, Morris, pays from $19,800 to $21,000, and the other, Swift, from $21,500 to $22,000 per week in wages. Every day the old hands remain out takes them farther away from their places, as new hands are being constantly engaged. We have a good deal of sympathy with any real grievance of wage-earners and with those suffering oppression of any sort, but we have no sympathy whatever with these Chicago strikers. Their demands are extortionate; their methods are tyrannical; their conduct is atrociously selfish. To gain an advantage enjoyed by those engaged in no other industry, they are doing their best to injure the vast cattle trade that centres at Chicago, and thus inflict losses amounting in the aggregate to tens of thousands of dollars on the cattle raisers on one hand, and the meat consumers on the other.

The long rows of bob-tailed horses at our Horse Show called forth a vigorous protest from Mr. Henry Bergh. The practice of docking the tails of horses is as senseless as it is cruel. Mr. Bergh well says: "This cruel mutilation of the noblest animal given to mankind by a bounteous and all-wise Providence, whose wisdom is thus wantonly insulted, is not the result of necessity, but is a pure and simple freak of thoughtless fashion." Does not that state the case in a nutshell? One has only to watch the long lines of docked and mutilated creatures to be convinced of the utter senselessness and barbarity of the practice. These butchered tails are the result of the same paucity of intellect that has given us the eyeglass, the cane, the tight boots, and torturing collar of the "dude." In the latter case man only inflicts ridicule upon himself. In the former case he inflicts cruelty upon a helpless animal and lessens its ability to defend itself against insect enemies. We join with Mr. Bergh in urging the managers of the National Horse Show to discountenance this practice. They can drive it out of fashion if they wish to do so.

The strength of the vote cast for Henry George in this city was a great surprise to the politicians. No wonder they are frightened. That such a new party, without organization, without funds and without the help of experienced politicians can poll 67,000 votes in this city is indeed surprising. The George ticket was the earliest in the field. Hundreds of extreme party men pledged themselves to support George before the other nominations were made. They supposed, naturally enough, that each of the old parties would put up some political "boss," as in previous years. Having given their word, they supported George even though their own parties were forced into nominating the best set of candidates ever placed before the people of New York. Farmers can learn a lesson from this movement. By taking a determined and dignified stand in favor of what they know to be right, by thoroughly organizing and holding their organizations, they can force honest and courageous candidates upon parties. Is it not worth doing this?

The farmers have done fairly well at the hands of the voters. Mr. Luce is elected Governor of Michigan, Messrs. Russell and Burnett go to Congress from Massachusetts, and many other farmers have been honored by an election to State or National offices. In many districts the farmers' vote made itself felt unmistakably. It is high time that it should. The farmer has carried political hacks on his back long enough. It is time he shook off the burden and carried himself more erect. That is just what he is going to do, as we have faith to believe. The old argument that no one but a lawyer can make a law is growing weaker. The old sneer at "farmer legislation" is heard less frequently. We need men of all classes in our legislatures. We need farmers, mechanics, business men and lawyers. Our laws affect them all. Their views should be taken into consideration. The idea that we must pick out the town lawyer to send to the legislature has been killed forever. Why should a class of men select as their representative a man of theories who knows nothing of their wants or of their ways of life? This question fairly put to the mechanics in more than one of our manufacturing towns destroyed the political hopes of dapper young lawyers. Let the farmers of the country adopt the same tactics. In a few years they will notice a wonderful improvement in the character of their candidates.

A MARVELOUS SCHEME.

The extortions of the Cotton Oil Trust Company in the South have given rise to a gigantic scheme looking to a combination of the cotton planting industry of the four States of Texas, Arkansas, Mississippi and Louisiana. It is proposed to organize a syndicate or trust company composed of large capitalists from all parts of the country and the planters of these four States, and that the latter should exchange their property for stock certificates in the corporation, to the full value of their holdings, the company to manage each plantation through the planter or an overseer under a district supervisor, one supervisor to be in each parish or county, the planter, if in charge, to be allowed a reasonable salary for his services. The company is to furnish money to purchase for cash from first hands all the supplies necessary to carry on the business, and to handle the products through competent agents, thereby saving immensely in the expenses of handling, selling, and freights, as well as in the cost of production. The company would be able to demand from the Trust Company, in spite of its $35,000,000 capitalization, fair and remunerative prices for its cotton seed, or in case of refusal, establish mills and make cotton-seed oil and cake itself. Of course, if the scheme proved practical and successful in the above four States, it would be very easy to extend its limits over all the Cotton States, while a similar organization might be formed to farm all the land in the rest of the country. The plan seems a trifle chimerical; but the very conception of it and its thoughtful consideration by practical men show very forcibly the straits to which the agricultural interests of the South are forced to seek an escape from the oppression of a gigantic monopoly.

HELPING MANKIND.

A young student recently gave us his ideas about the regeneration of mankind. He graduated at one of our leading universities and then studied several years in Germany. He was supposed to be well grounded in the theory of progress. He talked well. What he said seemed plausible enough. It did seem as though happiness could be manufactured to order, and that a few cold philosophers could live in seclusion and guide the world, outside their retreat, to a higher standard of enjoyment and comfort. As we walked up the street a woman sat on a door step. She carried a crying baby. Weary and worn she had stopped for rest. She dropped her handkerchief into the street. She could not secure it without putting the baby to one side. Did our young philosopher, with his intense desire to increase the comfort and happiness of the world, help her? Not he! His great plans could not be interrupted by such things. He walked on proving most logically that our system of government was all wrong, while a laboring man picked up the handkerchief, gave the baby a smile and passed on. Which man is doing the most good, the theorist or the man who believes in practical benevolence? They are like two men climbing up a ladder. One has his eye only at the top; he neglects to watch his feet. The other goes slowly up watching the rounds and making sure of his work. It is far easier to theorize than it is to practice. We can all tell what ought to be done for those who need help, but how many of us have the patience and courage to do the little things that go to make life what it ought to be? The fact of it is that there are chances for doing good all around us. He does the most for mankind who makes the circle of his immediate influence as bright as possible. He is a poor reformer who reaches over the heads of those near him to put his hand a little nearer the lamp of popularity.

TOO MUCH TRUST A CAUSE OF DISHONESTY.

While business dishonesty is so generally commented upon as one of the appalling sins of the day, would it not be well for the defrauded ones to consider how much they—themselves—are to blame for it? How many housekeepers who buy sugar and tea, meat and muslin, weigh or measure the same, and know that they are dealing with honest tradesmen? How many tradesmen have a realizing sense that if they defraud their customers, even in a small way, they will surely be found out and suffer for their dishonesty? How many bank directors make it practically impossible for the cashier to make away with all the available funds? Is it not true that a false sentiment has grown up in the land, which is fostered by laziness and inertness—that it is "narrow" and "mean" to make it difficult for people to be dishonest. Everybody likes to be "popular"—to be thought "liberal-minded" by his fellows. This infinite trust in everybody's honesty goes beautifully until the supposed honesty looms up in the shape of fraud, when everyone cries aloud for an argus-eyed being who is "mean" enough, and suspicious enough, to *know* that affairs are dishonestly conducted and unwilling to trust to the honesty of the honestest man alive. We may not "love" the precise, accurate man, who is just to the last cent, both ways, so well as we do the easy-going fellow; but we trust and respect him a great deal more, in fact.

If nobody "finds fault," the "general average" of excellence is quickly lowered. The pound of butter weighs but fifteen ounces, the "new" milk is made up half of yesterday's skimmed milk, the dressmaker retains for her private use the leftovers from the fabrics she cuts into gowns, and tells you upon her honor that not a scrap was left. The workman gossips for half an hour with the hired man on the other side of the fence and calls his day a 'full" one—and so on, *ad infinitum*,—purchasers and employers "let things go" because it is too much trouble to make a "fuss." The "fuss" may not be nice, but if properly made, it goes a long way in keeping things up to a righteous level and the sense of honor whetted. It is to the credit of human nature that it has civilized itself—what civilization it has attained to But all uplifting of the race comes from certain individual heroism and courage, which quite as often wins opprobrium at the time, as glory. But it is the saving salt, nevertheless, just as strict discipline, and the requirement of strict service, on the part of those in power, tend to a higher morality in those who serve.

THE OLEOMARGARINE LAW IN FORCE.

The oleomargarine tax law went into effect on Monday. A considerable number of the manufactories have either shut down entirely or suspended the manufacture of oleomargarine for the present, confining themselves entirely to the production of the oils, which the United States Attorney-General has lately decided are not within the scope of the law. Most of the manufactories and a considerable number of wholesale dealers have already taken out licenses, but there is less alacrity among retailers. In this city there were more than 3,000 retail dealers in oleomargarine before the new law went into effect. Few of these were selling the stuff frankly and without disguise, while a great many deliberately deceived and defrauded their customers who bought the counterfeit for genuine butter. There is no eagerness among any class of retailers to take advantage of the new law and sell the concoction solely on its merits, for less than 100 of them have hitherto taken out licenses.

In addition to the two cent tax upon the manufactured article, every manufacturer must pay a yearly license of $600; while wholesale and retail dealers must pay, the former, $480 and the latter, one-tenth of that amount, and very heavy penalties are attached to violation of any provision of the law. The Federal authorities are more vigilant and efficient in detecting and punishing any violation of the Internal Revenue laws, than are those of any of the States. There are hundreds of liquor and cigar dealers in this and other large cities who pay no State taxes; but the number of those who evade United States taxes is very small. At first there will probably be some difficulty in detecting bogus from genuine butter, but the risks for dishonest dealers will be greatly increased by the fact that manufacturers and wholesale dealers must make monthly returns to the local collectors of internal revenue specifying the quantity made and the parties to whom it was sold.

There is a good deal of difference of opinion as to the effect of the law on the sale of oleo. Many say that as the stuff must be sold without disguise under its real name, the falling off in the number of customers must be great. Others insist that as the law charges the revenue officers with the duty of inspecting the manufactured article, and empowers them to condemn all unwholesome material, this inspection will certify to the consumers that the article offered for sale is pure, and thousands will prefer pure, cheap oleo to dear butter that may be less palatable however pure.

BREVITIES.

The Thanksgiving Number of the R. N.-Y. next week.

We have received fine heads of Thousandfold rye from H. E. Boyd, of Wilmington, Vermont.

Mr. A. J. Caywood informs us that he is but 62 years of age. We may therefore hope that he will not only live long enough to learn that what little we have said against his fruits has not been said from the low motive he ascribes to us, but that he will live to originate lots of other varieties so perfect that no one in the land can justly say one word against them.

Encouraging! The Rural New-Yorker has been coming to me for 30 years or more, without a single year's omission, save one, during the war, when the Potomac River was blockaded for a term. The Rural has not a more constant and abiding friend in all its list of subscribers. No paper has come up more fully to my idea (and particularly of late) of what is the *perfection* of a rural family paper. I feel that my days are nearly numbered, and don't know but what I shall have my family to continue it in my name. J. G. R.
Lovellsville, Va.

The San Francisco papers are doing well in once more urging the wine growers of California to stop giving foreign names to domestic wines. The idea of American names for American wines is gaining headway; but it should be encouraged still more by all who have the best interests of American vineyardists at heart. The average quality of good American wines is held to be better than that of imported wines; and the latter would steadily fall into disrepute were it not that their reputation is kept up by the superior quality of domestic wines sold under their names.

There can be no doubt that the evil of indorsing notes has resulted in the ruin of many good farmers. Young men particularly should shun this practice. The responsibility is too great. The indorsee assumes every responsibility, yet he has no share in the profits of the business transaction, and no voice in its management. He must simply pay the full amount, if by means of misfortune, mismanagement or rascality the maker of the note cannot pay it. There is nothing to be made but everything to lose. The demands of friendship are great, but the duty one owes to himself and those who are dear to him should never be overlooked.

Prof. Roberts, who examined the famous cow Clothilde during her recent test, says that before she was milked he saw the pail turned bottom up by the milker. The object was to make sure that no milk was contained in the pail before milking began. It was not to insure cleanliness—the cow could not have made her record in a filthy place. It was a simple thing to do, and yet thousands of dollars would be added to the value of our dairy products if the practice could be made universal. Often do we see milkers sit at the cow's side with the pail on their knees. After a few brushes at the udder and side they begin to milk, regardless of the hairs, dirt and dust they have brushed directly into the pail. All this dirt hurts the price of butter far more than oleomargarine ever can.

Sheep Husbandry.

Notes from the Western New York Farm.

SHEEP VERSUS COWS.

IS IT ADVISABLE TO CHANGE?

Of late so many letters have come to me asking as to the advisability of changing from cows to sheep, or sheep to cows, and also as to the comparative numbers of each that can be kept per acre, the labor involved, the effectiveness of each in keeping down weeds and in maintaining the fertility of the farm, and the profit to be derived from each, that I propose to answer the whole in a body and general way.

No matter in what line of husbandry a man may have been engaged, or how much he may be discouraged, he should make no radical changes without a careful study of the matter in all its bearings, and even then it is better to go a little slow. Not every farm is equally well adapted to both systems of farming; for while cows do splendidly on rich, level land, even if a little wet at times, such pastures are not suited to sheep. They will not thrive nearly as well on the herbage natural to such lands, and if confined to such a range more than temporarily they would be almost sure to become diseased. On the other hand, on land so rough and rocky that the cows would need shoeing, and where the grass is so short and so much hidden by the rocks that cows could barely pick a subsistence, sheep would be perfectly at home and soon become "fit for mutton." The water supply also has much to do in the matter. While the cows would be discontented, wandering about lowing and losing flesh without an abundance of water, sheep would do very well on good, succulent feed without any water, save what they would get while eating the dew-laden grass, and in any case they would thrive with "a drink" once in 24 hours. And then the demands of the market and the means of transportation should be considered. The products of the cows are less bulky than wool, and if sent as ordinary freight would cost less for transportation, but they require more care in handling and, as a rule, must be sent by express or in refrigerator cars, and thus do actually cost more in freight charges than wool, which, if kept dry, can be sent in any way without danger of injury.

As to the comparative number of each that can be kept per acre, so much depends upon the breeds of each that may be selected, that it is very difficult to lay down a rule; but, taking both cows and sheep as generally found among farmers, it is not far from correct to assume that eight sheep may be substituted for one cow while running at pasture; but of course in Winter, if both are put into warm stables or barns, as they should be, the sheep, while consuming no larger proportion of food, will occupy a greater proportionate space. With sufficient ventilation and proper care a cow will be perfectly comfortable and her attendant have ample room to perform his labor in a space 3½ by 14 feet, making 49 feet of floor space, but if sheep be crowded to the utmost limit of safety not more than four could be put into the same space; but, then, if the barns are of sufficient hight, they can be "double-decked" (one floor put above another) and the sheep can be safely kept one lot above another, thus getting eight in place of each cow.

The Labor Question is, without doubt, greatly in favor of the sheep, for while they should be seen daily and salted once a week, and will need some further attention in the way of washing, shearing, and separating the lambs, etc., etc, these are only trivial matters compared with the labor of driving the cows to and from pasture twice each day, milking and converting the milk into butter or cheese, and then if the waste milk is to be utilized, a lot of hogs must be kept, and, of course these must be fed and looked after—so much for the Summer care. In Winter there would not be so great a disproportion, especially if both were kept as store stock, and further if, as is usually the case in the dairy districts, the cows were allowed to "run dry" from four to four and a half months; but even then a man will care for 100 sheep more easily than for a half dozen cows providing he gives each the best of care; for while the difference in giving to each will be but little, the cow stables will need cleaning twice daily, and the cows should be carded daily; the sheep pens, on the contrary, will need cleaning but twice or, at most, three times for the entire Winter, and if when put into the stables the sheep are properly treated for ticks, they will need nothing beyond feeding and watering and a little care to see that the proper ventilation is given.

As weed and bush exterminators there is no comparison between the two. While the cows will when first turned out in Spring while the leaves are fresh and green, or perhaps in case of very scanty food during severe droughts, eat many kinds of shrubs and bushes to a limited extent, they will not touch the thousand and one varieties of weeds that pester the tidy farmer, and the fields in all the dairy districts as well as in those devoted to grain raising are yearly becoming more foul and a greater disgrace to the careless owners. On the contrary, no animal, unless perchance the donkey and the goat, has a more varied taste than the sheep, and while it, unlike the others, will not live on a steady diet of tin cans, old boots, etc., it readily eats almost all kinds of noxious weeds; and if given a chance will entirely eradicate ragweed, golden rod, daisies, wild carrots, ripple and nearly all other weeds that make the careful farmer's life a continual warfare; and even Canada Thistles will eventually succumb to their persistent cropping. Nothing will so quickly eradicate the bushes in newly cleared fields, or those that line the fences or grow in clumps in too many of the older fields, as a flock of sheep. If they are cut so low early in Summer that the sheep can reach the topmost leaf that is left and the fields be closely pastured, a single season will see the end of every green thing. Very much of the prevalence of weeds and bushes on all the older farms is due to the fact that sheep have ceased to be kept, and I shall hail the day when their increasing numbers shall destroy those eye-sores and make our farms once more decent and presentable.

Since the middle of September we have had an abundance of rain, with very warm weather, and wheat is making a luxurious growth, in fact, some pieces which were sown the last week in August and first in September are in danger of getting so large that with heavy snows they will smother.

* * *

There is nothing which so greatly aids in putting the soil in the best possible condition for receiving the seed wheat, as a good soaking rain. It settles down the under soil to a proper hardness for receiving the seed, helps to fine the top as no amount of rolling or harrowing will, and then there is something in it which seems to make the grain start off as though it "meant to get there." I have one field, sowed about Sep. 10th, and before the big rains, and others sowed 10 days later and after the rain, and though both are equally good land, and received a like amount of fitting, the wheat sowed after the rain has the best appearance, and I have no doubt it will give the best account next harvest.

* * *

Those old fogies who claim that a heavy clover sod cannot be fitted for wheat and again re-seeded the following Spring, would do well to come and see a field we have on the Western New York Farm. In the Summer of 1885 it cut two tons of clover hay, was then fitted and sown to wheat, and this year 12 acres gave over 500 bushels, and Prof. Roberts can speak of the clover catch, as he saw it the latter part of June. There is no trouble in getting clover to grow when the proper material is put into the soil.

J. S. WOODWARD.

Miscellaneous.

LAW.

Here are some recent legal decisions of interest to farmers—and the rest of the world:

Mortgage.—In the case of Cheney *vs.* Woodruff, the Supreme Court of Nebraska held that the Act passed by the Legislature of that State in 1869 extending the period of limitation of mortgages of real estate to ten years, necessarily extended the limitation of debts secured by such mortgages to the same period as the mortgages.

Note Signed on Sunday.—A promissory note signed on Sunday, but not intended to be delivered till Monday, and not in fact delivered till that day, is not subject to the objection that it is a Sunday contract, according to the decision of the Supreme Court of Iowa in the case of Bell *vs.* Mahin *et al.*, decided October 5. The Court based its decision on the principle that a promissory note becomes a contract at the time of its delivery.

Discrimination in Freight Rates.—The words "discrimination in freight rates" used in a statute embrace an "overcharge" for the transportation of freight, according to the decision of the Texas Court of Appeals in the case of Missouri Pacific Railway *vs.* Parkhurst.

Constitutionality of the Assisted Immigration Act.—A decision was rendered in the United States Court at Detroit recently affirming the constitutionality of the "Assisted Immigration Act" of February, 1886. The defendant, Craig, imported ship carpenters from the Province of Quebec during the shipyard strike of last Spring. The defendant's counsel had interposed the objection that the entire law against importing labor was unconstitutional. The court held that the law is within that provision of the United States Constitution permitting Congress to regulate commerce. To the objection that the laws can not punish an offense committed in Canada, he answers that Craig's offense was committed on this side by the actual landing of the Canadians. This is equivalent to the law punishing an accessory to a crime. If the crime is not committed, the accessory is not guilty, but as soon as it is committed the accessory becomes liable.

Shop Orders and Cash.—Five years ago the Pennsylvania Legislature passed a law prohibiting mining and manufacturing companies from paying the wages of their employés in "store orders." The Supreme Court of that State has just set aside this enactment as unconstitutional. The Court says:

> The law is an attempt by the Legislature to do what, in this country, cannot be done—that is, prevent persons from making their own contracts. The act is an infringement alike of the rights of the employer and the employe; more than this, it is an insulting attempt to put the laborer under a legislative tutelage which is not only degrading to his manhood, but subversive of his rights as a citizen of the United States. He may sell his labor for what he thinks best, whether money or goods, just as his employer may sell his iron and coal, and any and every law that proposes to prevent him from so doing is an infringement of his constitutional privileges, and consequently vicious and void.

The general principle that persons should be left free to make their own contracts is a sound one. There is a growing tendency toward too much restrictive legislation on the relations between employer and employé. The Pennsylvania statute was, however, aimed at an abuse of which working people may justly complain. It may be well enough to say that whether a hired person shall be paid in shop orders or cash is purely a matter of agreement between him and his employer. But it is an agreement into which he may be forced by the want of employment, and one which must deprive him of the advantage of buying his supplies with cash.

R. M. H., Brooklyn, N. Y.—A leases to B house and stable. B sublets stable and part of house to several under tenants. A wishes to dispossess B for non-payment of rent. Has A to serve all parties occupying stable and house with dispossess papers, and if so, how is he to do so, not knowing how many under tenants there are or their names? If B, on receiving dispossess papers, wishes to pay rent, has he not to pay all costs and disbursements and fees for lawyer, if any are required? If A should start a suit against B only for amount of rent due, has B to pay all costs, disbursements and lawyers' fees?

Ans.—The sub-tenants need not be served with dispossess papers; they will be duly ejected by the marshal. In order to obtain a stay of proceedings, the delinquent tenant must tender the amount of rent due, and also pay or secure to be paid, the costs; but these do not include the lawyers' fees. The same would be the case in the supposition last mentioned.

L. R. H., Syracuse, N. Y.—In this State, when a wife dies leaving real estate inherited by her mother, to whom does it go, in case she leaves no will, and her father is still alive? Does not her father have the use of it during his life?

Ans.—According to the laws of New York, the real estate of persons deceased descends in the following order: 1. To the descendants. 2. To the father. 3. To the mother, and, 4, to the collateral relatives, subject to various other provisions. Thus, if the deceased be a married woman, and she leaves a husband by whom she has had issue, he will be "tenant by the courtesy" of her real estate during his life; or, if the inheritance came to her from her mother, then if her mother be dead, the inheritance goes to the father for his life time, and the reversion to the brothers and sisters and their descendants. If none such are living the father will have it in fee.

L. H., Newark, N. J.—The rear of my lot abuts upon a lot whose level is several feet below mine. Upon whose property should a wall be built to prevent the earth of the higher lot from falling upon the lower one, and upon the owner of which lot should the expense of building the wall fall?

Ans.—Neither owner is compelled to build such a wall. The inferior lot owner is under no obligations to support the higher level, but if the latter has been artificially raised, and the soil falls over on the lower in such a way as to cause appreciable damage, the injured owner may have his action for damages. The legal maxim *de minimis*, etc., (the law does not concern itself with trifles), is quite likely to apply in the case.

W. L., Troy, Pa.—I shipped by express a a package of goods, the value of which was over $500, but did not specify same. Am I bound by law to be satisfied with $50, as the express company claim that according to their printed receipts they are only liable to amount of $50, in case of loss, except I state at time of shipment exact value?

Ans.—The limitation being known to the shipper, he cannot recover more unless he can show that the property was lost through the gross carelessness or neglect of the carrier.

We have received a considerable number of complaints with regard to "The National Co." of this city, which advertises that it will "give away" 1,000 self-operating washing machines to those who send their addresses. When the addresses are sent, certain services are required as a preliminary to getting the donation. The "washing machine" is declared to be worthless by a few who received it; but nearly all who complain do so because, after having done what was required, no machine was sent to them.

Be slow to have any dealings with any party who advertises to give you anything of value "free." Sometimes the word appears in large letters in the advertisements of concerns that deal "on the square," but they are usually engaged in some picayune business and are willing to resort to a dubious trick to attract attention and secure correspondence. In four cases out of five, however, the word is used for the same purpose in the advertisements of those who are trying to get an unfair advantage over the public in some way. Advertising costs money, and these people usually advertise quite extensively, so that they must be scooping in a good deal of money to be able to stand the drain. It stands to reason that if anybody really wants to give something valuable for nothing, there is no need whatever to advertise for people willing to accept the gift. Either some service or work is always required in payment of the article offered, or other goods must be bought for a price high enough above their legitimate cost to pay for the "present," on the same principle on which chromos are given free by many grocery stores to the purchasers of a certain quantity of goods; or they are mere traps laid by sharpers to catch the greedy and gullible.

In all cases where anything of value is given payment is required in one way or another, and those who offer it always take care that their dupes, however smart they may think themselves, never get the best of them. What is given for nothing is worth just that.

To Several Inquirers.—B. H. Rowley, J. Stewart and James Dixon all of this city, are "sawdust" swindlers, who are papering the country with circulars soliciting dishonest dupes to purchase counterfeit money...The "Common Sense Evaporator" made at Newark, Ohio, is as great a fraud as the Arnold Evaporator denounced here and in our editorial page over six months ago. Both have been heartily praised by "The Fruit and Vegetable Growers' Association" which is itself a humbug and a fraud. "Dr." Orlando Smith forms the whole active force of this "Association" and "Orlando" is either one of the numerous *aliases* or a mere mouth-piece of J. M. Bain, the pestiferous Ohio swindler. This clever rogue has again taken in several newspapers by getting them to publish Orlando's commendation of his worthless evaporator.

CATALOGUES, ETC., RECEIVED.

Sherwood Harness Co., Syracuse, N. Y., Catalogue of the goods made by this trustworthy firm. We have repeatedly called our readers' attention to this harness, having seen it at several fairs and having always heard it well spoken of. Among the many letters published in this catalogue, we find the following from Major Alvord, late Manager of Houghton Farm, and now Professor of Agriculture at the Mass. Agricultural College. "We ordered a set of your Novelty Harness for the express purpose of using it in plowing in orchards, and not expecting to find it useful otherwise. We have tried it, however, with almost every kind of farm work where a two-horse team is required, and are so much pleased with it as a general farm harness, that I write to express the great satisfaction which we derive from its daily use."

Ferrier's Improved Corn Sheller.—Circular from Philo Ferrier & Son, Ypsilanti, Michigan. It is claimed that this sheller is entirely different from all others. It is a right-hand machine and stands at a convenient hight. The cob is separated by means of a sieve. It is the lightest working sheller made.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

OF INTEREST TO WOMEN.

A LITTLE kindly courtesy goes a good way in a busy household, and if in our home we use the same politeness as we offer our guests, we shall see no ill-fitting "company manners."

The new winter wraps seen so far differ little from those of last season, excepting that the majority display a tight cape coming to the waist-line. Some very shapely Newmarkets with these capes are seen, made of smooth cheeks. The rough homespuns so popular last Winter seem to have disappeared entirely from the counters of large stores; it is impossible to purchase them. What becomes of these out of date goods is a profound mystery to the uninitiated.

At this season the perennial church fair and its allies appear before the public, and the promoters of such enterprises are usually anxious to provide some novelty. A good idea for such an entertainment is a loan exhibition with some novel supper in addition. Articles of "bigotry and virtue," as Mrs. Malaprop says, may be borrowed from every one possessing such; tastefully arranged they make a pretty show. Such an affair in a New Jersey town had in addition a Dutch kitchen, arranged with real old Dutch furniture, where meals *a la Hollandaise* were served by waitresses in gowns of genuine Dutch antiquity. It looked like a Washington Irving interior and was a great success on the ground of its novelty.

NOVELTIES IN DECORATIVE ART.

SINCE decorative art became chief idol of all feminine souls the dealers in bric-a-brac and like vanities have been making constant efforts to propitiate that exacting deity, until earth and sea and sky are ransacked for novelties in decoration. We may congratulate ourselves that the reign of æsthetic gloom is past—we are no longer required to sit on impracticable chairs in the dim shadows of impossible windows, all in the name of art. This season we seem to have entered an era of gilding and metallic effects, since everything is thus adorned, from gilded wash-boards to gilded Chianti wine flasks, the latter, by the way, making a very quant and pretty ornament when tied with a big bow of vari-colored ribbon.

A decided novelty this season was a genuine Hindoo punkah, made from the great leaves of the stately Chusan palm, a near relative of our own palmetto. They are gilded or bronzed, then decorated with garlands of natural flowers and foliage, preserved by some secret process similar to electro-plating, keeping the delicate natural form under its coating of metal. But if the gorgeous Hindoo fans suggest Scherezade and her train, some dainty little French china candlesticks must have been designed for Queen Titania herself. Imagine a full-bloom La France rose, with its curving, silvery-pink petals, bearing in its centre a dainty rose-pink spiral that it seems positive profanation to call a candle. They are, without doubt, the daintiest trifles imaginable, quite irresistable to any feminine heart.

Who would imagine that a decorative future lay before the pith of everyday, unromantic corn-stalks; yet we are shown charming hanging cabinets covered with a tressellated design in this material. It is prepared with fish-glue, according to a process known only to the inventor, and has a soft whiteness very pleasing to the eye. These cabinets are mounted with stuffed birds; their natural treatment affords a great relief after the stained-glass attitudes and conventional designs affected by the average taxidermist. The same artist, we believe, is designer of some exquisite bird screens; one specially worthy of note was of peacock blue plush, mounted in brass, bearing a single snowy egret; it is bordered with soft white and Quaker-tinted feathers, with one tiny bird in an upper corner.

We are all familiar with the use of straw-matting as a dado, but we saw it put to a new purpose; it was made into a screen or panel, handsomely painted in oils, a work of infinite difficulty on such a rough and porous surface. A screen of this material, mounted in gilded bamboo, depicted a Cardinal's reception.

We may stop to listen to the chimes of a tall, ancestral-looking clock, though the case is a reproduction, the works are old English, striking the hours with a clever imitation of old Westminster chimes. It is too saddening, however, with it ceaseless

"Never, forever
Forever, never;"

We pass on to a quaint chiffonier in Dutch marquetry, similar in style to Sheraton furniture, and containing enough secret drawers to hide away the wills of a regiment. Here is a carved Flemish cabinet, too, which would have gladdened the heart of Edwin Forrest, whose taste in that direction was above reproach. The deep-toned carving of the cabinet brings out in fine relief some of Webb's English glassware that suggests in form and color some of the old semi-opaque Venetian. Of old Venetian there is a choice display, perfect in form and matchless in coloring, while Crown Derby and Royal Worcester, Modern Bretby and quaint Satsuma make a background suggestive of Keramos itself. Truly, of making of bric-a-brac there is no end, and we shall continue to worship the Proteau fetich we call decorative art indefinitely, unless Dame Fashion steps forward, and orders us, in the language of Mrs. Gradgrind, to go and be somethingological immediately.

LETTING THINGS SLIDE.

ALICE BROWN.

HOUSEKEEPERS who are mothers and have care and work in unlimited quantities often let all that is worth living for slide out of their lives, and themselves slide early into the grave or worse into hopeless, disappointed drudges.

They have seen a long procession of valued things slide away. Leisure and strength, the approbation and praise of husband and children, time to give to the society of friends and the enjoyment of books and papers, or for attention to the details of neat and becoming dress. Perhaps good temper and loving kindness have joined the procession and beautiful hope sorrowfully and reluctantly followed as the last of the departing train.

It is unselfish women who do this, but they make an idol of this virtue and sacrifice themselves to it. They give to their households all that they thoughtlessly demand and find their gifts exhausted long before their families cease to need their wealth of hand and heart.

The home should come before the house, the heart before the body, the mind before the appetite, the woman before the drudge, and she who aims and strives for the higher things will not become a cipher in her own household.

It may take more moral courage to refuse to do all the drudgery of the house than to accept it. But if by any managing or contriving the heaviest work can be done by some other than the mother, the home will gain more than the house will lose. It is often impossible to hire a girl by the week or month, but there may be a boy or girl in the neighborhood who could come for half of each day, to bring in wood and water, gather and prepare vegetables, do the churning, if not too heavy for the size of the child, and save countless steps in many ways. If treated with kindness and justice the boy or girl would be glad for the chance to earn something. If no boy or girl is available, some wash-woman in the neighborhood may be glad to do the churning in exchange for a share of the buttermilk each time or to help during house-cleaning time in return for old carpeting that she could use in her smaller rooms.

When any variety of good fruit has become a drug on the market, the same woman may be glad to give a few days' work and receive her pay in the fruit. The pay in such a case ought to be at the market price of the fruit be that as low as it may. When a man is employed for the year, on the farm, his duties should include during the Winter, building fires, carrying wood, and any heavy work that comes within his skill. Any such work ought to be specified when he is hired and accepted with appreciation if done cheerfully.

If the children are old enough to assume some responsibility, they can lighten the mother's load and ought to take delight in their work. Rewards given with judgment, and a regular allowance of money for regular work done by the oldest ones, will brighten the work very much for all.

Having divided the labor relieving the head of the household department of as much as is possible, the time thus gained ought to be given to something recreating and uplifting; something enjoyable. At least once a week the mother should have some evening set apart to entertain husband and children, that they may become her warm friends as well as her nearest relatives.

Giving and receiving the same courtesy from each other that is thought due other friends will beautify home wonderfully, and it will be as attractive as the home is hateful, where drudgery, cross words and selfish strifes dwarf and distort the family life.

HINTS FOR ACCIDENTS AND EMERGENCIES.

THERE are comparatively few mothers who know just how to act in case of a sudden illness or accident. At such times, all the remedies one has ever read or heard of, seem to escape one as if by magic. Such of our readers as have a family of young children with ever present bumps and bruises and illnesses may find it worth their while to cut out this article, which has been carefully compiled, and paste it where they can have ready access to it in case of need.

In case of a cut or wound, decide first whether the blood comes from an artery or a vein If it is of a dark color, oozes slowly and evenly, it is from a vein, while if from an artery, it will be bright red, and spurt in jets. In the former case you can generally check the bleeding by binding on a hard pad. In the latter case tie the limb with a twisted handkerchief or cloth between the wound and the body. Then apply cold cloths, ice, or in severe cases cloths dipped in a solution of alum or tannin. As soon as the bleeding is checked, bring the edges of the cut closely together with adhesive plaster. If any matter forms, wash the cut frequently with a solution of carbolic acid, one part of the acid to 100 parts of the water.

If a sprained ankle occurs, remove as quickly as possible the shoe and stocking. Wash frequently with cold salt water, and if there is much heat in the joint, apply cloths wet with witch hazel, which is generally on hand in the family medicine chest. A mixture of seven ounces of water, one of opium, and one dram of sugar of lead is also excellent. Keep the foot elevated, and cool, do not stand on it, and move it as little as possible. For the sting of a bee or the bite of any insect, apply a bruised onion, ammonia, diluted, witch hazel or bi-carbonate of soda to the part affected.

Children frequently suffer greatly with earache; a drop of warm olive oil mixed with an equal amount of laudanum will often relieve this if dropped in the ear. Place a little cotton well saturated with chloroform in the bowl of a clay pipe; insert the stem into the ear of the sufferer and plow gently. The evaporating chloroform will relieve the pain immediately. If there is any foreign substance in the eye, take hold of the lashes of the upper lid with the left hand and pressing the dull point of a pencil against the middle of the lid, turn it upwards, then remove the substances with a camel's hair brush or the corner of a soft handkerchief. Particles of lime often cause great pain if they get into eye. Apply weak vinegar to neutralize the alkali and remove the particles as directed.

MANY a fond mother has been so frightened at being awakened by the peculiar ringing rattling cough that heralds croup, as to be unable to apply or think of a remedy. This disease always attacks its victims in the night, and is to be greatly dreaded on account of the extreme rapidity with which it developes. If possible, in this as in all cases where you distrust your own ability to act, send for a physician, but meantime, until his arrival, much may be done to check its ravages and relieve the patient. Give an emetic, ipecac in teaspoonful doses every five minutes until vomiting ensues, is the easiest to give a child; put hot, moist poultices of flaxseed or hops on the throat and upper part of the chest. A hot bath if practicable will often give relief.

DIPTHERIA is another malignant disease where a little prompt action will sometimes avert the most serious consequences. The symptoms are soreness of the throat, pain in swallowing, and the formation of a grayish membrane in the back of the throat. There is always a low fever, depression of spirits and a rapid decrease of strength. An eminent physician told me that one of the best remedies to be applied in the early stage, is to paint the throat inside with iodine, if this is not at hand, use lemon or lime juice until it can be obtained. If the patient is old enough to use a gargle, pure lemon or lime juice, a solution of chlorate of potash, sulphur and water, or alcohol and water are very affective. Powdered sulphur blown into the the throat is also good.

HICCOUGH is disagreeable and sometimes dangerous. A few drops of ether on a little sugar will frequently give relief when all other remedies fail.

SELMA CLARE.

GOLDEN GRAINS.

THE Holstor Methodist says: Seek to be useful and let greatness take care of itself.....

THE nerve-force invested in fretting and complaining is the poorest investment in the world .....

DO not trouble yourself so much about whether your church is a regular gospel church, as whether you are a regular gospel Christian.....

YOU laugh at the quaintness of the country preacher, and fail to profit by his words of truth. It is the old "Go up bald-head" spirit.

MAY the Lord give me such an insight into what is really good, that I may not rest contented with making Christianity a mere addendum to my pursuits, or with tacking it as a fringe to my garments!—*George Eliot*....

HON. P. T. BARNUM says that the argument to which he surrendered when he became a total abstainer from intoxicating beverages was presented by the late Rev. E. H. Chapin. It was this: "Either you can stop drinking without difficulty, or you cannot. If you can stop without difficulty, then you ought to do so for the sake of your example. If you cannot stop without difficulty, you are already in great danger and you cannot escape it a moment too soon."..... .....

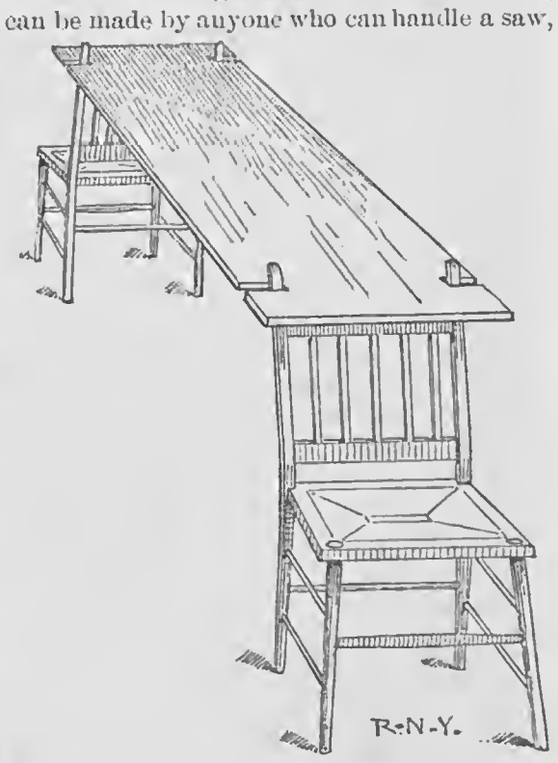
Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

What can be more hopelessly, helplessly unhomelike than a parlor full of span-new furniture?

IRONING BOARD.

A VERY handy board for ironing dresses, shirts and in fact garments of all descriptions, can be made by anyone who can handle a saw,



plane and square. The illustration shows how the board is notched near the ends to allow of the tips of the chairs passing through. Place the clothes' basket on one of the chairs.

GEORGE PELTON.

ONE WINTER.—No. 1.

ANNE THRIFTY.

WE were poor that Winter and we faced the fact cheerfully; if the elders of the family, my uncle and myself, were not always happy, the growing twin boys seemed to be, and that we felt was a great deal to say of the little city home that had lost the presence of wife and mother in the early Autumn.

Economy was absolutely necessary and was practised in the kitchen and pantry as carefully as elsewhere in the house. We had a cow and two hens, and from an eighth of an acre of ground we had saved for winter use a dozen fine Hubbard squashes and a few dry Lima beans, and had canned two dozen quarts of tomatoes. Our food was plain and frugal. For breakfast we often had a loaf of corn-bread made by pouring boiling water over two cups of corn meal first salted (we always used white meal in Indiana) and the batter being right to pour readily it was poured into a hot greased pan and baked to a nice brown in a brisk oven.

Heat was the secret of success in this bread, and when rightly made and baked we thought it very toothsome. We often ate it broken into new milk and said, as we enjoyed our simple breakfast, that a king might envy us. Our cow and the two hens gave us good food for the growing boys, and we felt that with good milk we dared economize in meats without danger to health.

The hens faithfully provided one egg every day and all of us being fond of bean soup, I often made it for dinner with egg dumplings in it. Soup beans were six cents a quart, and after the Limas from our garden were gone I bought those for our soup. When boiling the beans for the soup the water was poured off twice and fresh added, otherwise the soup would have had a strong, unpleasant flavor.

The dumplings were made of two eggs beaten light, into which was stirred about a half-cup of flour and a half-teaspoonful of baking powder and a pinch of salt, making a batter which, dropped in spoonfuls into the soup, puffed into light yellow balls; and they were ready to serve with the soup after five minutes' boiling.

For several days I would save the daily egg and then use the four or six, as it might be, for a dish of scrambled eggs, made by breaking the eggs into a pint of milk and stirring when they began to harden. We liked it better so than to beat up the eggs before mixing them with the milk. Sometimes when the

eggs were few I used a little flour, beaten to a smooth paste, to thicken the milk, before putting in the eggs; for the boys came from school with healthy appetites and our dishes were few at each meal, so I always tried to have plenty. Just before Thanksgiving the boys came in from school one day running over with anticipations of a Thanksgiving feast, and both talking so fast that I could not understand either.

But finally I learned that they were trying to tell me what they wanted for the Thanksgiving dinner, and my heart sank to think of the disappointment in store for them as I thought helplessly of our limited purse. But their anticipations were so eager, and their faith in Cousin Anne so abiding, that I felt I *must* do something to meet them.

ONE way to economize in light—buy kerosene by the barrel.

HIRED MEN ON THE FARM.

MRS. F. N. D. writes us that she would earnestly urge all farmers' wives to protest against the boarding of farm hands. She considers that the average hired man is the most vexatious element that the housewife has to contend with, and that a home cannot be a home where he exists. She thinks that the extra cooking, washing and ironing that his presence necessitates furnish the last straw to the already over-burdened wife. But our correspondent's grievance reaches the climax when she tells of the selfish, inconsiderate actions of the man on Sunday. He is invariably late to breakfast on that morning thereby preventing the mistress from attending church while the rest of the day is spent in loafing around the house and making as much noise as possible. While we sympathize with our correspondent's trials we beg to be permitted to state that we should be mistress in more than name in such a situation, and that it is in our humble opinion more the master's fault than the man's, when the latter is allowed to increase instead of lighten the wife's work.

OIL FOR DOMESTIC MACHINERY.

MUCH time and worry can be saved by busy housekeepers, by "having things handy by," as my Yankee neighbors say. If the pantry is across the room from the cook-stove, a shelf or table beside the stove having on it at least salt, pepper, knife, fork and spoon needed in cooking, will save miles of steps in a year. Sugar, flour, spices—plainly labeled—baking-powders, flavoring extracts, etc., kept in one place, and molding-board, rolling-pin, cake-cutters and baking-dishes in another group, rob baking day of half its trials. Broom, dust-pan, duster and floor-cloths hung side by side, help sweeping day to "start fair." If at some distance from a store, a slate hanging in the pantry, with pencil tied to it, on which to jot down needed supplies as soon as exhausted, is a real help. An emergency corner in a closet, where rolls of worn linen and muslin, sticking salve, sweet oil for burns, ammonia for bee-stings, arnica for sprains, etc., are kept, and another corner where paper bags, wrapping paper and strings can always be found, prove treasures indeed. Mrs. Fisher once said that "every room in the house ought to contain needles, thread and scissors." A scrap-bag hung on the sewing-machine—fancy or plain—will save a deal of sweeping threads and bits of cloth from the carpet. Last, tho' not least, a cushioned chair kept "handy by" in the kitchen to rest in, if only for five minutes, when one is so tired, and a good book or paper—R. N.-Y. for instance—within reach to pick up at odd minutes will refresh both body and mind. Many other things will suggest themselves to quick-witted housewives intent on making the most of everything, themselves included. HOUSEKEEPER.

RUBBER gloves are a boon to women whose hands chap easily. They can be had of any dealer in rubber goods, and cost $1.25. Get them a size larger than the hand.

A DISHWASHING machine has been invented. The dishes are placed on a rack and a light cover is fitted over them. Below is an arrangement something like a turbine water wheel. This is fitted with hot water and rapidly turned by means of a crank. The hot water is dashed violently against the dishes and washes them.

ACCORDING to Harper's Bazar frank people are interesting in certain aspects. They have a pleasant knack of letting us know all their opinions; they never mince the matter. They tell you exactly what they think of you and of all the world, and what everybody else thinks, as far as they know. There is naturally little reserve about them; if your nose is not to their mind, they feel it their duty to enlighten you; if your gown is not becoming, they do not spare your feelings, from the kindest motives; otherwise you might be going about the world in the belief that they approved of you.

FANCY muffs will be fashionably worn, and will be even more popular than fur ones, for the reason that they admit of greater change, and can be easily made to match the costume. The prettiest that we have seen are made in both velvet and plush, and are in the form of a bag gathered at the top, and much trimmed with bows and long loops of narrow ribbon.

DOMESTIC RECIPES.

GOOD COOKIES.

RUB together two cups of white sugar and one cup (six ounces) of butter, add nutmeg or whatever flavoring preferred, also three-fourths cup of sweet milk and two cups of flour with which has been mixed and sifted two teaspoonfuls of cream-of-tartar. Mix, then add one-fourth teacupful of sweet milk in which is dissolved one teaspoonful of saleratus, beat well, pour all into the center of the pan of sifted flour, mix to roll out, as soft as possible, roll somewhat thin and bake in a quick oven.

EUREKA COOKIES.

TWO cups of sugar, one cup of butter, scant, three eggs, one teaspoonful of saleratus dissolved in half cup of water, nutmeg, and flour merely enough to roll. Beat the butter and sugar together, add the eggs and beat well, then the other ingredients, pour into flour and mix: roll thin.

TOMATO SOUP.

THIS is a most excellent dish for those who are fond of the tomato. Take five or six large, ripe tomatoes: pour boiling water over them, after which the skins are easily removed; cut the tomatoes up fine, put them in a suitable dish, add water, two quarts or less as you like; season to taste with salt and pepper, add a small piece of butter, boil until the tomato is well cooked to pieces, now stir a scant tablespoonful of flour, smooth with a gill or so of rich, sweet milk; stir this in, let it boil a few minutes and serve it hot. Rightly seasoned this soup is very nice. Canned tomatoes may be used instead.

A NICE WAY TO COOK PARTRIDGE.

DRESS, joint and wash the bird, slashing the breast through the outside layer lengthwise, on each side: put to cook in water to well cover it, adding, presently, some salt and pepper and a small piece of butter. When tender pour off nearly all the broth, and set it aside for the gravy; there should be a bowlful. Now add to that remaining in the kettle an ounce or so of butter, cover and let it boil up briskly until the broth boils away nearly to roasting, then remove the meat, cover and keep warm. Pour the broth saved back into the kettle and when it boils thicken with a spoonful of flour mixed smooth with some butter and perhaps a little water. When done and rightly seasoned to taste, it should be immediately served. Pour over the partridge or serve separately.

GLADDYS WAYNE.

MOLD OF CHICKEN.

BOIL a chicken or chickens in as little water as possible until very tender, pick the meat from the bones, rejecting skin, and chop or cut into small pieces—not mince. Season with pepper and salt. Boil until hard a half dozen eggs and cut into slices. Put into the bottom of a mold some slices of egg, cover with chicken, then arrange some slices of egg around the sides of the mold pressing in the chicken against the pieces to keep in place. In this way fill up the dish. Boil down the broth so that there will be about a cupful for each chicken; season and to each cupful add a teaspoonful of gelatine, which you have first soaked in a very little cold water. Pour over the chicken while warm, not hot and set aside for a day or night. Turn onto a platter and garnish with celery leaves or parsley.

MRS ECONOMY.

POTATO YEAST.

The compressed yeast, now in general use is so convenient for housekeepers, it appears hardly worth while to give recipes for making yeast. Yet for those who cannot avail themselves of it I give the following directions for making excellent yeast. Place upon the fire a sauce-pan of boiling water, add one-half teaspoonful of salt to a quart of water. Pare three large potatoes, use a coarse tin grater and standing by the range grate the potatoes rapidly into the boiling water, stirring occasionally and let remain a few minutes over the fire until very thoroughly cooked. On this depends the keeping qualities of the yeast. On the manner of grating depends the snowy whiteness of the yeast. We for a long time grated the potatoes into a bowl and added to the boiling water. Even one moment's exposure to the air gave the grated potato a dark color. Remove from the fire and when nearly cold add one cake of dissolved dry or compressed yeast to raise it. Set aside in a warm place and in about six hours it is ready for use. Keep afterwards in a very cool place. To this may be added cooked grated potato as often as is desired to make new yeast, and you will always have a good article with little trouble.

POTATO BREAD.

At this season with potatoes at their best, it is well to use them in the bread as well as yeast. Set the sponge at night. At dinner-time boil a half-dozen extra potatoes for the bread sponge. We use Snowflakes now as white as flour and nearly as dry. When cooked take them into a pan with about one pint of flour. Mash them fine and pour over them and the flour the water in which they were boiled, if clear, but if cooked in an iron kettle do not use it, but take boiling water from the teakettle. Work together in a smooth paste, thoroughly scalding the flour. When nearly cold add one cupful of the potato yeast, beat well together and set aside until evening. It will then be of feathery lightness. Add to this one pint of warm milk and flour to make a thick batter, indeed all the flour you can stir in. Let stand over-night in a warm place, and in the morning sift three quarts of flour with one even teaspoonful of soda. Pour the sponge on to the moulding board and work it long and well, resting the hands from time to time by using a chopping knife to chop the dough. This will give a very fine, light grain and is easier than the tiresome motion of kneading. Very moist, white, light bread will be the result.

BUTTER-MAKING IN WINTER.

As cold weather approaches the difficulty of churning is increased, especially where one cow only is kept, and the cream is a long time in gathering enough for a churning. As you skim the cream, salt and stir it every day. Churn it every week if you have but little. When you put it into the churn add an equal quantity of very warm, sweet milk. Let the milk be almost scalding, not quite, for, of course, that would turn the cream to oil. Turn the crank of the churn slowly as you pour in the milk to mingle it with the cold cream. Many of us have no thermometers for determining the exact temperature. Our experience is that this will help to bring the butter in a very short time, and good, sweet butter too, if you do not let the cream stand too long. Sometimes neglecting to salt the cows makes the churning very tedious, and allowing the cream to stand in a very cold place will cause it to "swell"—that is, rise up in its wrath, and remain wrathy till one's patience is exhausted. Try the warm milk to appease said wrath. C. J. S.

CORN-STARCH PUDDING WITH VARIATIONS.

I MAKE my plain corn-starch pudding as follows: One pint of rich, new milk, two tablespoonfuls of corn starch, a scant half cupful of sugar, the whites of four eggs and a little salt. Put the milk over the fire, when boiling-hot add the sugar, then the corn starch which should be dissolved in a little cold milk. Stir constantly until smooth, then add the whites beaten to a stiff froth. Stir a few moments on the back of the stove and turn into a mold. Dip the mold into cold water before turning in the corn starch. Turn out when cold and eat with a soft custard made of a pint of milk, a half cup of sugar and the beaten yelks of the eggs. Put these ingredients together *cold* into a small tin dish, and set into a dish of boiling water. Stir until it thickens. When cold flavor with vanilla. One change of this pudding that we enjoy very much is this: When that part of the pudding I turn into the mold is done, stir in a cupful of grated cocoanut, and then turn out. This is delicious. Another pretty variation is to take out a third of the white corn starch while hot, and add to it three spoonfuls of grated chocolate melted in a very small quantity of milk. Now put into the mold a layer of the white, then the chocolate and cover with the white. Again you may vary the plain pudding by dropping seeded raisins or small pieces of citron into the corn starch as you turn it into the mold.

MRS. E. G.

IT is time to think of Christmas presents.

YOU can keep lemons fresh for some time if they are put into a glass jar or stone crock and covered with cold water. Change the water twice a week and keep in a cool place. We have kept them good in this way for three weeks.

Pain in the Side

Is a symptom of disease. It may be caused by Rheumatism, or by Neuralgia, but it usually indicates a disordered condition of the Stomach, Liver, or Kidneys. Ayer's Sarsaparilla corrects the action of the vital organs, and removes every trace of disease from the system.

Last fall and winter I suffered from a dull, heavy, pain in my side. I did not notice it much, at first, but it gradually grew worse until it became almost unbearable. During the latter part of this time, disorders of the Stomach and Liver increased my troubles. I began taking Ayer's Sarsaparilla, and, after faithfully continuing the use of this medicine for some months, the pain disappeared and I was completely cured.—Mrs. Augusta A. Forbush, Haverhill, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.
Sold by all Druggists. Price $1; six bottles, $5.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston Mass.

LADIES We make a specialty of giving premiums for the forming of Tea Clubs for our pure Teas and Coffees. **We defy the world on price and quality.** No house gives same quality goods and premiums. A host of useful and ornamental articles to select from. Silver-plated Casters for $5, $7, and $10 orders. Sets, elegant designs, Silver-plated Tea for $20 and $50 orders; or beautiful Gold-Band China Tea Set or handsome **READ** Decorated Dinner Set, Moss-Rose Toilet Set, Gold and Silver Watches, Clocks, etc. Illustrated price and premium list, and full particulars sent free. **SPECIAL OFFER:** To every tenth person that answers this advertisement we will send **free one pound of choice Tea.** Write at once. **THIS**

News of the Week.

HOME NEWS.

SATURDAY, November 6, 1886.

THE elections just held have been fruitful in surprises, and will undoubtedly afford material for reflection to party leaders and managers for some time to come. The results have been very much mixed, and in some cases the contests have been so close that their outcome still remains in doubt. No groundswell in favor of either party is apparent on the face of the returns. The gains and losses are pretty evenly divided between the two great parties. The Democratic majority in the House of Representatives has been greatly reduced, but the Republicans have lost ground in the Northwest, a section toward which their rivals have for some time cast anxious eyes. The vote of the workingmen has made itself strongly felt in a number of directions. Among the surprises of the election must be counted the defeat of Mr. Morrison in Illinois, and the narrow escape of Speaker Carlisle in Kentucky. In some quarters these events, as also the defeat of Mr. Hurd, are regarded as evidences of a desire to rebuke these legislators for the part they have taken in agitating the tariff question. The most genuine surprise of all to the average observer was the large vote polled by Mr. Henry George for Mayor of New York city. Mr. Hewitt, the Democratic candidate for the office, was elected by 113,000 votes, but the labor candidate was second in the race with 68,000 votes in round numbers, or over 7,000 more than were polled by the Republican candidate. . .Another earthquake was felt in the Southern States yesterday—the most severe since that that upset Charleston. It was most severe in Savannah, Ga., and Columbia, S. C. Very slight damage was done and no casualities are reported.....

A MEETING of the Western New York Salt Manufacturers' Association is soon to be held to establish a pool and raise the price of salt. Although common salt is now sold as low as 60c. a barrel, the barrel costing 25c., "still there is little profit in its manufacture at this price by the most economical manufacturers." Those who oppose a pool think that higher prices would bring in many new manufacturers. .....Public debt reduction in October, $13,101,519.....A big strike of beef packers for eight hours at Chicago, and a big pork packers' strike at St. Louis.....Mrs. Stewart's will leaves her estate among her own folks, with discretion on the part of Judge Hilton, her executor, to apply some of it to the services of the Protestant Episcopal Cathedral and its belongings which she had built and endowed at Garden City, Long Island, a place founded as a business speculation by her husband. No public benefactions ..... Monday, Liberty's torch was lighted on Bedlow's Island, New York harbor, and there was an elaborate display of fireworks, which had been deferred from the unveiling of the statue, owing to wet weather..... .Louis Berial, for 25 years an employé in the Custom House in New York, shot Surveyor of the Port H. S. Beattie three times on Monday. Had been dismissed, on Beattie's recommendation, for illegally charging duty on an immigrant's baggage.....A council of Roman Catholic archbishops at Baltimore has favored leaving each archbishop to treat the order of Knights of Labor as he sees fit in his own diocese. This doesn't antagonize Cardinal Taschereau of Montreal, or commit the Church one way or the other, while leaving each archbishop free to pounce upon troublesome Knights in his own section—a very diplomatic stand.....Frank Walworth, the murderer of his father in 1873, in this city, died at Saratoga, Saturday, of pneumonia, aged 31....."Red Top," President Cleveland's country place, will be formally opened November 15, when the horseshoe will be nailed over the door. .... Jay Gould says he found business so good out West that he has ordered between 4,000 and 5,000 new cars for the Missouri Pacific, mostly freight cars, but including 150 passenger coaches; also 100 locomotives..... Consul Brigham says the rumor that a large filibustering party had been organized to go to Mexico with A. K. Cutting at its head, is positively untrue ....That St. Louis train robber took $120,000 instead of $50,000 as first reported Officials "know who he is and he'll soon be arrested".....The St. Louis Sugar Refinery, the largest in the West, has shut down, unable to compete with the Sandwich Island sugar, which is admitted free of duty. Several other refineries have lately shut down for the same reason.....In the new Vermont Legislature the House has passed a bill granting suffrage to women, by a vote of 132 to 82..... Two alleged Know-Nothing organizations in Chicago are reported to have 1,500 to 2,000 members devoted to the theory that foreigners shall not hold office in America, and working by secret circulars and private meetings.. .....It is semi-officially announced in Canada that a dissolution of the Dominion Parliament has been decided upon. It will be the most important election since the act of federation.....The Chinese laundrymen of New York have decided to form a trade-union for the purpose of keeping up the rates on their work, and will fine every Chinaman who does not join or who cuts rates $100, boycotting him if he fails to pay. Chinese cheap labor will soon be a thing of the past..... . .....The estimates of the expenses of the postal service for the next fiscal year aggregate $55,346,150 while the appropriation for for the current year was $54,365,863, showing an increase in the estimates for the next year of $976,286.....The Secretary of the Treasury has this week issued the 144th call for the redemption of bonds. The call is for $10,000,000 of bonds of the 3 per cent loan of 1882. We're wiping out the public debt at an "alarming" rate. What shall we do with surplus taxes when they can no longer be applied to its payment?.... ....

FOREIGN NEWS.

SATURDAY, November 6, 186.

EUROPEAN news of little general interest. Bulgaria embroglio still menacing the peace of Europe. Grand Sobranje for electing a Prince is in session at Tirnova, but making little or no headway, owing to the evident opposition of Russia and the timidity of some, the indifference of others and the want of combination of all the other Powers. Kaulbars issues orders in the name of the Czar, in opposition to the Government, as if in a Russian Province. All parties—politicians, military officers and soldiers—engaged in the conspiracy against Prince Alexander in May, have been set at liberty on the peremptory demand of Kaulbars. Nabokoff, the military leader, has started a rebellion in favor of Russia, at Bourgus, and Karkoff, Karaveloff and Metropolitan Clement, the political leaders, are plotting a new *coup d'état*. War likely in Spring or before, unless Russia is allowed her own way.....

AGRICULTURAL NEWS.

SATURDAY, Nov. 6, 1886.

THE Dairy Commission of this State cost $30,000 in 1884; $50,000 last year, and $105,000 is wanted this year. Now that State laws are backed up by Federal law ought not something really good be got for this outlay? .... State Dairy Commissioner Hurst reports that the sale of butterine and oleomargarine in Ohio has declined 75 per cent. within the first five months of the operation of the State dairy laws.... First dead duck—Easterbrook & Co., oleomargarine manufacturers, at New Haven, Ct., have suspended on account of the Government tax law which went into effect Monday.....Dr. Merriam, chief of the new Bureau of Ornithology, denounces the English sparrow. The pest spreads over 130,000 square miles annually.... At least $4,000,000 were paid out for leaf tobacco in Danville, Va., in the year ended September 30, and as much in Lynchburg.....The factories in Manitoba have increased from six cheese factories in 1885, to seven cheese and five butter factories in 1886. ....The hop crop of Washington Territory this year was about 2,550 bales..... ..In the summer packing season of 1886, Chicago packed 258,000 more hogs than Kansas City, St. Louis, Milwaukee, Cedar Rapids, Indianapolis, Cleveland and Cincinnati combined. In the same part of 1885, Chicago was 542,000 ahead . .....The man who puts up a barbed wire fence in Nebraska is responsible for any damages sustained by men or animals coming in contact with it.....The State convention of the Anti-Horse-thief Association of Missouri met at Sedalia, on the 21st inst., 200 members being present. Reports by the committees showed the order to be increasing in orders and influence, and horse stealing decreasing as the means of detection and capture become more certain.... .....During the seven weeks ending September 18th there were 82 fresh outbreaks of pleuro-pneumonia reported in Great Britain, and there were 319 cattle attacked. The above figures show an increase over the returns for the corresponding week of last year, when there were 64 fresh outbreaks and 276 animals attacked. ....The great Killerby Herd of Short-horns belonging to the late J. B. Booth, Yorkshire (England,) was sold recently, 58 animals bringing an average of $464.12.....The exports of live stock and dressed meats per steamships from Boston for the English markets last week were 827 cattle and 1,280 quarters of beef..... .....The London market for American live cattle is flat, at 11 cents for best, estimated dressed weight. .....It is rumored that the International Range Association is about to establish huge stock yards at St. Louis, intended as special opposition to Chicago..... .....Latest cablegrams state that the November wool sales in London have been postponed one week, to the 30th. Great efforts have been made to increase the available supply, which is now claimed to be 125,000 bales. A quiet market is expected.... The grain elevators in middle and northern Minnesota and Dakota are overflowing, and 3,000 cars of wheat billed to Minneapolis cannot be brought into the city because the transfer roads cannot handle it. .. ..The National Horse Show which has been in operation here during the week, was moderately successful. It was altogether a "dudish affair" patronized almost exclusively by fashionables to whose tastes and whims it catered. We have a long report of it; but we do not think it worth the space it would occupy..... .. ..

Crops & Markets.

SATURDAY, November 6, 1886.

The regular weekly review of the Mark Lane Express of Monday last, concerning the English breadstuffs markets and stocks held abroad, contained the following: "The deliveries of native wheat have been small at 6d. to 1s. above the previous week. The sales of English wheat were 48,910 quarters at 30s. 3d., against 56,950 quarters at 31s. 4d. during the corresponding period last year. Country flour is firm and 6d. dearer. Foreign wheats are firmly held. Values are unchanged. Corn has risen 3d to 6d. The domestic wheat markets have not shown much change during the week, except that the tendency has been to hold well to the slight gains.

That usually careful journal, the Cincinnati Price Current, furnishes some statistics and conclusions concerning the peanut crop which are of interest. It reports the supply as follows:

	Bushels.
Stocks in all markets, Oct. 1885	985,000
Tennessee crop	800,000
Virginia crop	1,800,000
North Carolina crop	150,000
Total supply	3,735 000
Less stocks on Oct. 1, 1886, at—	
Cincinnati	459,700
Virginia	300,000
Tennessee	175,000
Wilmington	35,000
Other points	50,000–1,019,700
Total consumption, 1885-86	2 715,300
Consumption in:	
1884-85	2,905,000
1883-84	2,170,000
1882-83	1,970,000
1881-82	1,520,000
1880-81	2,168,000
1879-80	1,957,000
1878-79	1,389 000
1877-78	1,066,000
1876-77	1,187,000

Stocks at "other points" include 35,000 bushels at St. Louis, 4,000 bushels at Louisville, and estimated 11,000 bushels at Evansville. Eastern cities hold about the same as a year ago—Boston 5,000 bags, New York 8,000 bags and Philadelphia 6,000 bags; but these do not enter into the account in either year. The supply available for consumption during the ensuing year—October 1, 1886, to September 30, 1887—as deduced from the foregoing statistics and estimates (which are no doubt carefully made) is given as follows:

Stock on hand Oct 1, 1886	1,019,700
Tennessee crop	800,000
Virginia crop	1,500,000
North Carolina crop	160,000
Total available supply	3,479,700

The aggregate pork packing in the West the past week has been 210,000 hogs, compared with 230,000 the preceding week, and 255,000 for the corresponding week last year. This moderate movement of hogs is attributed to various influences; the weather has continued favorable for feeding, and too warm for packing without the use of ice; the unsettled feeling in regard to labor employed by packers has had some influence; prices of hogs are regarded as low by farmers, and this may have had some effect in retarding the marketing. Prices at Western points, however, are well up to the Chicago basis. As compared with a week ago, prices of hogs at Chicago are without quotable change—a slight advance within this period having been lost at the close; the average of prices is about $3.65 per 100 pounds, the better grades of both light and heavy ranging up to $3.95 to $4.00. The range of prices of product at Chicago during the week for January delivery has been as follows: Mess pork $9.77 to $10.37½, lard $5.87½ to $6.05, per 100 pounds; short rib sides $5.02½ to $5.30, showing an advance of 32½ cents on pork, 15 cents on lard, and 25 cents on short rib sides, compared with a week ago. This strengthening of prices has partly been due to fear of a strike among packing house hands at Chicago, which might for an indefinite time interfere with the manufacture.

CHICAGO report of the visible supply of grain last Saturday: Wheat, 56,154,000 bushels; corn, 13,097,000 bushels; oats, 5,409,000 bushels; rye, 467,000 bushels; barley, 2,232,000 bushels. This shows an increase of 780,000 bushels wheat; 50,000 bushels oats; 31,000 bushels rye, and a decrease of 339,000 bushels corn and 71,000 bushels barley.

New York statement of the visible supply of grain October 30: Wheat, 56,652,991 bushels, increase, 778,651 bushels; corn, 13,098,041 bushels, decrease, 337,520 bushels; oats, 5,409,153 bushels, increase, 50,784 bushels; rye, 466,584 bushels., increase, 30,717 bushels; barley, 2,233,071 bushels, decrease, 70,187 bushels.

The Indian corn market has been quite firm, the visible supply report for last week showing a decrease of 337,520 bushels. Late advices as to the crop are that it is turning out much worse than intimated by recent estimates. The Chicago Tribune states that some estimates, covering large areas in Nebraska, Iowa and Kansas, place the yield at not much above 40 per cent. of a full crop.

Oats have been fairly firm, with the increase of 50,784 bushels reported in the visible supply and the outlook continuing for a good crop as compared with late years. The demand has been fair. Oats were a shade stronger on Friday and wanted, though actual business was slow. Rye and barley were very dull and unchanged.

The butter market has been entirely nominal, and prices are unchanged. Exporters are almost out of the market, and late shipments compare very unfavorably with those of last year for the same time.

	Nov. 5.	Nov. 5, '85.
Creamery, new choice to fancy	27@29c.	27@29c.
State, new dairy fancy	21@25	21@23½

A good deal of activity has been infused into the cheese market during the past few days, and prices have advanced. Fancy cheese is scarce, but exporters do not fall in very freely with the advanced views of holders.

	Nov. 5.	Nov. 5, 85
New cheese (f'cy)	12¼@12¾	10

INGERSOLL, Canada, November 2.—Twenty-seven factories offered 21,925 boxes September and balance of season. No sales reported. Factorymen holding for 12¼ to 12½ cents, which price buyers do not seem inclined to to pay. Thirty-three factories represented and eleven buyers present.

All of the principal wool markets are quiet and show no promise of increased activity for the present. Fine and fine medium, Territory and pulled wools are noticeably weak. Manufacturers are not inclined to buy at present in excess of near-by wants, the outlook for the fabrics which they are about to present samples of being still uncertain. The latest advices from London show a great degree of strength in the English market, but Melbourne dispatches are less encouraging. Purchases in that market on American account are almost entirely wanting, and a decline of five per cent. has been reported within a day or two. The next series of sales at London will open on the 30th. The demand for wool for the knit-goods mills of Central New York continues slack, the lockout being apparently as far as ever from settlement. At Boston there is no quotable change in values. The current quotations for leading sorts, compared with a year ago, are as follows:

	Nov. 6, '85.	Nov. 5, 86.
Ohio & Penn. X	32@33c.	31@35c.
Ohio & Penn. XX	34@35	36
Ohio & Penn. XX and above	35@37	37@38
Michigan X	31@32	32@33
Fine Ohio delaines	36@37	38
No. 1 combing	36@38	38@40
Texas spring, 12 months	22@25	23@26
Super A	33@37	33@37

The sales of the week at Boston are reported at 3,145,000 pounds, as compared with 2,181,600 last week and 2,400,600 in the corresponding week a year ago. At Philadelphia wool has been extremely dull, the week's business aggregating less than 450,000 pounds. There is no quotable change in prices, the majority of holders refusing to increase sales at the cost of price concessions, and having confidence in the future of the market.

MARKETS BY TELEGRAPH.

SATURDAY, November 6, 1886

CHICAGO.—Compared with cash prices a fortnight ago, No. 2 Spring Wheat is 1⅝c. lower. Corn, ½c. higher. Oats, unchanged. Rye, 2c. higher. Barley, unchanged. Flaxseed, ¼c. higher. Pork, 45c. higher. Lard, 27c. higher. Cattle, 15c. to 50c. lower, Hogs, 5c. to 20c. higher. Sheep, 5c. to 10c. lower.

WHEAT.—Dull; No. 2 Spring, 73¾@73¾c; No. 3 Spring 63@66c; No. 3 Red, 73¾c. Futures ranged: November, 73¾@73¾c; December, 74⅝@74⅝c; January, 75@75¾c; May, 81¼@81¾c. For the Young.

THE STORY OF A DISTRICT SCHOOL

A COLLEGE BOY'S DIARY.

(Continued.)

"DON'T make no noise teacher," whispered Bill Johnson, "I'm gonter pay off a trick on Jack. Don't say nothin' but watch the fun."

He crept carefully along to one side of the room. The moonlight which came streaming in at the window, gave him light enough for his purpose. I saw him carefully push away an old husk mat which lay on the floor. As he did so a light shot up from the room below. A hole through which a stove pipe had once passed was revealed.

Bill fairly shook with suppressed laughter as he untied the bag. He held the mouth open and suddenly shook the contents through the hole. A sadly mixed collection of dried apples, oats and flour, plunged into the room below. Bill at once pushed the mat over the hole and fairly rolled on the floor with laughter. "He set right under it," he said, "an' gut the hull charge."

There was a great commotion in the room below. A great crash was heard as though Jack's chair had broken down. The red-haired young woman screamed and old Johnson's voice could be heard somewhere in the depths of the house shouting out some loud instructions. Bill Johnson crept out of the room and carefully shut the door after him. In a short time I heard the door slam violently and concluded that Jack had gone away in no very enviable frame of mind.

I walked down stairs the next morning just as breakfast was leaving the stove. Old Johnson sat on the wood-box shaping an axe handle to suit him.

"Mornin' teacher," he said through his false teeth, "Ef ye wanter wash them bad dreams out, jest step outside an' I'll lay ye'll find a bucket."

On a wooden block by the well stood a battered tin basin. I washed my face and hands and came dripping back to the house to find a towel. A large roller towel hung by the stove. I was walking towards this with my hands and head held out when Mrs. Johnson rushed and took it down and then proceeded to hunt for a clean one, leaving me standing there with the water trickling down my neck.

"What's the matter," broke in old Johnson, "He aint no better'n other folks is he? There he stands lookin' like a toad under a harrer. Take the table cloth teacher ef ye wanter hurry up the wimmin folks. You sorter make me think of a feller I heard tell on onct. He went to a tavern to spend the night. When he come to wash he cud wring water outer the towel. He sorter spoke up about it an' the landlord he sed—"you're a putty man ain't ye? There's fifteen men ben ahead o' you an' you're the fust one to complain."

I could not see anything very funny in this story, but old Johnson laughed and choked till he was fairly black in the face. Mrs. Johnson at last brought a dry towel.

The young woman's eyes were redder than usual as we sat down to the table. Old Johnson lost no time in trying to make her feel as comfortable as possible.

"Jack sorter took Scotch leave last night didn't he? I expect I made a couple o' sticks o' wood out of it. I expect I'll have to gin teacher a vote o' thanks for throwin' them things down. Only I'd sorter hate to be in teacher's boots when Jack sorter ketches him out."

Here the young woman came to my defense. "It wasn't, teacher—it was Bill Johnson—that's who it was. You needn't tell me." Here she fell upon her main defense of throwing her apron over her face and running out of the room. Johnny nodded his head sturdily as much as to say that he could add evidence in my favor whenever it should be needed.

Old Johnson kept up his comments all through the meal, but nobody took the trouble to argue with him, so he had the whole field to himself. After breakfast Mrs. Johnson and the young woman put up my "pail o dinner."

If old Johnson's rule concerning teachers held true, they must have considered me a very poor educator—for they selected food enough to feed a small army for my dinner. There was quite a discussion for a time as to whether they should pack the food into a pail or a basket. It was finally decided to use the basket as it would hold more than the pail. A large cup of apple sauce was placed in the centre of the basket bottom. Around this were firmly wedged pieces of cake. Two large pieces of pie formed the next layer, with the odd corners filled up with thick doughnuts. Nearly half a loaf of bread cut into uneven slices with great irregular lumps of butter placed between them, and several slices of meat filled the basket so full that it required most of the young woman's strength to fit the cover on. The cover was at last pushed on and fastened on with a string. I did my best all through the packing to explain that I never could possibly eat all the food, but old Johnson laughed me to scorn.

"Needn't tell me that," he said. "You'll eat all that an' then come back early fer ter git a piece afore supper."

Old Johnson had some original ideas about serving food. "When you make up a pail o' dinner," he said, "ye wanter run big slices all ye kin. Ye kin eat a big slice o' bread quickern' ye kin two small ones. That's what ye wanter figger on."

The young woman had just fastened the cover to the basket when the kitchen door opened and Mr. Moderator Hardhack walked solemnly in.

"I've gut sum terrible bad news fer ter tell" he began. "'Squire Barues died last night—funeral to onct. I'm spreadin' the news sos't I can't make no stay. Better call off school fer two days teacher." He walked back to the door. There he stopped as if he remembered something. "An' word come over this mornin' that Miss. Billin's over ter the county house wuz dead. Funeral ter day. Like enough the boy orter go." He stamped out. Poor little Johnny. Sunday had come "in the middle of the week" at last.

FAMOUS TREES.

EVERY tree was once small and insignificant and some never get to be anything else. Others are very beautiful and have peculiar features, but there are few that are so wonderful in any way as to make them really famous. The largest tree in the world is the great Baobab of Africa. It is found south of the desert of Sahara. This tree seldom gets to be much taller than a hundred feet, but it is frequently more than that in circumference. The inhabitants of Africa build their houses among its branches and there have been known to be as many as thirty families living in one tree at once. The foliage is dark green, making a strong contrast with its white flowers that are borne on stems of a yard in length. The fruit is a dry, white, pulpy substance enclosed in a long green pod. The pulp between the seeds, as well as the juice from the leaves is used by the natives for flavoring their food. This tree is said to live to be of a greater age than any other. Some are known to have lived for thousands of years. When it dies it is from a softening of its woody structure, and it falls one mass of ruins.

The Banyan tree found in India is very wonderful because of its peculiar way of growing. The branches drop roots to the ground which form new stocks, and thus it goes on until one tree often covers a space of many hundred feet.

The big trees of Mariposa, California, of the variety Sequoia gigantia are very famous because they are the largest found in America. They are from three to four hundred feet in hight, the first two hundred feet of their growth being without a branch. The circumference of the trunk at the largest part is often more than one hundred feet.

The cedar tree, which is found in many parts of the world, has been known to have a trunk measuring 36 feet in circumference The cedar is noted for the durability of its wood, which has been known to last in a building for a thousand years. The cedar is often used as a simile because of its strength and durability.

Among famous trees of history is the Charter Oak of Connecticut, so called because the charter of that colony was hidden in its hollow trunk when the royal governor tried to take it from the colonists. Another famous tree is the Elm of Kensington, under which William Penn made the treaty with the Indians. And there is living now the famous Elm of Boston, under which Washington took command of his troops during the Revolutionary war. CERISE E. A CARMAN.

WE all know what a wonderful polish there is upon collars and cuffs that come from a city laundry. Our folks at home never could get such a gloss. I have asked some laundrymen how it was done. They say that the first thing necessary is to learn how to do up clothes. It is a regular business just like anything else. It can be studied out and made much of, or it can be slurred over and be turned into common work. Most of the polish used is made out of white wax and spermaceti, two ounces of the wax and one of the spermacete. These are melted together with a gentle heat. When the starch is made up in the usual way, a piece of this polish is put in. For a dozen pieces, a piece about as large as a pea is used. If any young woman had the reputation of being able to do up collars and cuffs as well as they are done in a city laundry, she could easily get work enough at good prices. Some people think that washing is a dishonorable work. That is all nonsense. No honest work is dishonorable.

IT is pretty close to Thanksgiving. I hope all the turkeys will be fat, and that the mince pies and apples will be just right. Uncle Mark wishes he could come and eat dinner with all of you. He would have to be a pretty good-sized man though, in order to do justice to every meal, and he doesn't believe in eating too much.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I intended to write to you during the holidays but my attention was so much taken up I did not find time. The holidays came in the midst of the berry time, and I had all I could do to help Mamma pick the berries. After all the fruit was taken care of, I went down to one of the islands on the mighty St. Lawrence and camped out two weeks. I enjoyed myself very much. I was on the river a great part of my time. I learned how to row and would have learned how to swim could I have remained longer. Every day about two o'clock we started out in a row-boat to ride on the swells of the mail steamer. It was grand! Our vegetable garden is looking rather empty, as we have taken up nearly all the roots. My Sweet Peas were beautiful and bloomed profusely. My time is very much taken up at school, as I passed into he second form in July and I am trying to pass into the third or highest form by Christmas, and then I will be allowed to try for a teacher. Papa found an apple on a tree called the "General Grant Crab" with a small apple grown into the stem of a large one. He said he never saw an apple grown like it before, and he wished me to send it to you to describe it to the Cousins. Papa bought it for a crab, but he is doubtful whether it is a crab or not. Please give your opinion and what variety it is. I enjoy the story of the District School very much. Your niece,

Cornwall, Ontario. ELLA M. TURNER.

[We cannot name the apple. It is rather a curious growth—a little apple growing just at the base of the large one. Probably two buds were close together. One grew and developed nicely and the other only half developed.—U. M.]

DEAR UNCLE MARK: I would like to join the Y. H. C. The seeds that you sent to Papa were doing nicely when the frost killed them. I have four sisters and two brothers. Papa has 18 head of cattle and three horses. I helped raise six of the cattle. We like the RURAL very much. Mary is writing you a letter also. Good-by. W. LEWIS ROBERTS.

Goffstown, N. H.

DEAR UNCLE MARK: I should like to join the Y. H. C. I am nearly 14 years old and I guess that is one-third as old as you are. I have three sisters and three brothers—I am the oldest of all. My sister Susie and myself have a flower garden. We planted the Garden Treasures and the hens got in and scraped some of them up but the most of them came up and had lovely flowers. I must close now. Good-by. MARY J. ROBERTS.

[You are coming pretty near to my age, yet you have not hit it yet.—U. M.]

DEAR UNCLE MARK: I guess you think I am slow about letting you know how the seed you sent me came out. We had a dry spell of weather after planting that hindered their coming up, so we have nothing to be proud of. Some came up after a long time and did better than we expected. I had two watermelons that weighed 17 and 16 pounds apiece, but not thinking them large or heavy enough to enter for the prize, I did not measure them, and now its too late. The Midnight corn—one ear measured 11 inches, one 10½. The Bird Cantaloupes grew large, but began to rot before ripening. All our muskmelons, and Cantaloupes seemed to be affected in the same way this season. The flower seeds were also affected by drought. Quite a number came up but were late. Had one mammoth sunflower, but very few of the seeds filled. Had eight kinds phlox, and as many kinds of petunias. There were five plants that grew like young trees, but did not bloom. I would like to know the name of them. There were six varieties of peas. A blue and white flower having much the appearance of a petunia is also unknown to me. In the Fall it became lousy which much impaired its beauty in my mind's eye.

Your affectionate nephew,

Sauk Co., Minn. E. R. CHILDS.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

DANGEROUS DRUGS.

How to Control Effectually all such Horrible Habits.

[*Rochester, N. Y., Post-Express.*]

A GENTLEMAN who has spent the Summer abroad, said to our reporter, that the thing that impressed him most of all was the number of holidays one encounters abroad and the little anxiety the people display in the conduct of business affairs. "Men boast here," he said, "that they work for years without a day off; in Europe that would be considered a crime."

Mr H. H. Warner, who was present at the time, said, "This is the first Summer in years that I have not spent on the water. Been too busy."

"Then I suppose you have been advertising extensively?"

"Not at all. We have always heretofore closed our laboratory during July, August and September, but this Summer we have kept it running day and night to supply the demand, which has been three times greater than ever before in our history at this season."

"How do you account for this?"

"The increase has come from the *universal recognition of the excellence of our preparations.* We have been nearly ten years before the public and the sales are *constantly increasing* while our newspaper advertising is *constantly diminishing.* Why, highly scientific and medical authorities, now publicly concede that our Warner's safe cure is the only scientific specific for kidney and liver diseases and for all the many diseases caused by them.

"Have you evidence of this?"

"Abundance! Only a few weeks ago Dr. J. L. Stephens, of Lebanon, Ohio, a specialist for the cure of narcotic, etc., habits, told me that a number of eminent scientific medical men had been experimenting for years, testing and analyzing all known remedies for the kidneys and liver; for, as you may be aware, the excessive use of all narcotics and stimulants destroys those organs, and until they can be restored to health the habits cannot be broken up! Among the investigators were such men as J. M. Hull, M.D., President of the State Board of Health of Iowa, and Alexander Neil, M.D., Professor of Surgery in the College of Physicians and Surgeons and President of the Academy of Medicine at Columbus, who, after exhaustive inquiry, reported that there was no remedy known to schools or to scientific inquiry equal to Warner's safe cure!"

"Are many persons addicted to the use of deadly drugs?"

"There are forty millions of people in the world who use opium alone, and there are many hundreds of thousands in this country who are victims of morphine, opium, quinine and cocaine. They think they have no such habit about them—so many people are unconscious victims of these habits. They have pains and symptoms of what they call malaria and other diseases, when in reality it is the demand in the system for these terrible drugs, a demand that is caused largely by physicians' prescriptions which contain so many dangerous drugs, and strong spirits, and one that must be answered or silenced in the kidneys and liver by what Dr. Stephens says is the only kidney and liver specific. He also says that moderate opium and other drug eaters, if they sustain the kidney and liver vigor with that great remedy, can keep up these habits in moderation.

"Well does not this discovery give you a new revelation of the power of safe cure?"

"No, sir; for years I have tried to convince the public that *nearly all the diseases of the human system* originate in some disorder of the kidneys or liver, and hence I have logically declared that if our specific were used over ninety per cent. of these ailments would disappear. The liver and kidneys seem to absorb these poisons from the blood and become depraved and diseased."

"When these eminent authorities thus publicly admit that there is no remedy like ours to enable the kidneys and liver to throw off the frightful effects of all deadly drugs and excessive use of stimulants it is an admission of its power as great as any one could desire; for if through its influence alone, the opium, morphine, quinine, cocaine and liquor habits can be overcome, what higher testimonial of its specific power could be asked for?"

"You really believe then, Mr. Warner, that the majority of diseases come from kidney and liver complaints?"

"I do! When you see a person moping and groveling about, half dead and half alive, year after year, you may surely put him down as having some kidney and liver trouble."

"The other day I was talking with Dr. Fowler, the eminent oculist of this city, who said that half the patients who came to him for eye treatment were affected by advanced kidney disease. Now many people wonder why in middle life their eyesight becomes so poor. A thorough course of treatment with Warner's safe cure is what they need more than a pair of eye glasses. The kidney poison in the blood always attacks the weakest part of the body; with some it affects the *eyes*; with others the *head*; with others the *stomach* or the *lungs*, or *rheumatic* disorder follows and *neuralgia* tears them to pieces, or they lose the *powers* of *taste*, *smell* or become *impotent in other functions* of the body. What man would not give his all to have the vigor of youth at command?"

"The intelligent physician knows that these are but *symptoms*; they are not the disorder, and they are symptoms not of disease of the head, the eye or stomach, or of virility, necessarily, but of the kidney poison in the blood and they may prevail and no pain occur in the kidneys."

It is not strange that the enthusiasm which Mr. Warner displays in his appreciation of his own remedy, which restored to him health when the doctors said he could not live six months, should become infectious and that the entire world should pay tribute to its power. For as Mr. Warner says, the sales are constantly increasing, while the newspaper advertising is constantly diminishing. This speaks volumes in praise of the extraordinary merits of his preparation.

PERSONALS.

GEN. JAMES LONGSTREET is about to write a book upon the late War.

REV. HENRY WARD BEECHER has returned in excellent health from his European trip.

THE President didn't go to Buffalo to vote this year, but he sent $500 to this city to help along his party. Gov. Hill did the same.

PRINCE LOUIS NAPOLEON has been receiving a good deal of attention in New York, Philadelphia, Baltimore and Washington.

MARTIN IRONS is back in St. Louis tending a feed store for the secretary of the Knights of Labor assembly while the latter looks after politics.

THE son of Ex-President Arthur and the two sons of the late President Garfield are studying at the Columbia College Law School this year.

MISS VAN VECHTEN, whom it was once said President Cleveland would marry, is now visiting Miss Rose Elizabeth at "The Weeds," at Holland Patent, N. Y.

JOHN D. ROCKEFELLER of the Standard Oil Company, now claims, by virtue of his $114,000,000, William H. Vanderbilt's old title of "the richest man in the United States."

GLADSTONE says that he is poor, but he declines a $10,000 pension, to which all ex-Prime Ministers in straitened circumstances are entitled, because he does not believe in the principle of it.

THE engagement is privately announced of James Russell Lowell, ex-Minister of the United States, to the dowager Lady Lyttleton, widow of the late, and aunt by marriage of the present, Lord Lyttleton. Newly-elected Congressman Burnett, his son-in-law, denies the report.

"GEN." BOOTH, of the Salvation Army, opens his campaign in this country at Chicago, coming from Canada. There they call him "a negro exhorter translated into English," and say that his effect comes solely from his iteration and vigor.

M. DE LESSEPS brought one of his daughters to this country during his latest visit, but left 10 of his children with their mother in France. The daughter suffered from seasickness during the voyage, but the octogenarian father did not.

WHEN Chauncey M. Depew came down from the stand under the Bartholdi Statue after his oration, he declared, with a long-drawn sigh, that it was the first time he had ever delivered an address to an audience of applauding steamboats.

F. W. STEWART, representative of a New York syndicate, is negotiating with the Cherokees for the purchase of the Cherokee Strip. The syndicate will offer $3 per acre for the 6,000,000 acres, to be used mainly for grazing purposes, as "little of it is fit for tillage."

SENATOR EDMUNDS'S fortune is now estimated at $250,000, principally made at his practice and by judicious investments in real estate. He owns two houses in Washington, his home at Burlington, Vt., and is supposed to make nearly $50,000 yearly practicing law.

M. PASTEUR, last Wednesday, informed the Academy of Sciences of Paris that he had treated during the past year 2,490 persons who had been bitten by animals, and that out of this number only 10 had died. Seventeen-hundred-and-twenty-six of the patients were French.

SAMUEL PAYTON was discharged from the prison at Jackson, Mich., Saturday, his sentence of five years for a Detroit burglary having expired. Payton is a grandson of Commodore Perry and is said during his incarceration to have been left a fortune of $250,000.

THE alleged Sir Roger Tichborne or Arthur Orton, famous as the Tichborne claimant, is now living in destitution at New York, confined to his bed by blood poisoning and kept alive by the ministrations of the St. George Society. He bitterly regrets his voyage to America to lecture, as it has turned out a miserable failure.

GENERAL VALLEJO, who played so prominent a part in the early history of California, and who once owned a principality in Sonoma County, is now living on his last small remnant of land in the suburbs of the town of Sonoma. He has just brought a suit in San Francisco to recover possession of a portion of the Presidio, or military reservation of that city, which he claims under a Mexican grant, confirmed to him in 1836.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XLV. No. 1921. NEW YORK, NOVEMBER 20, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

THE RURAL'S THANKSGIVING GREETING TO THE FARMER.

God bless you, Mr. Farmer;
  May nothing you dismay,
May peace and happiness be yours
  This bright Thanksgiving-day.
Your friends are all before you,
  We bring you words of cheer,
Let not your heart be troubled
  About the coming year.

We greet you, Mr. Farmer,
  We love the dear old farm,
We're proud to work and do our best
  To keep your babes from harm.

We come to greet you kindly,
  Our compliments to pay,
E'en though our lives be offered up
  To celebrate the day.

Be thankful, Mr. Farmer,
  That this slow-changing year
Has left you strong and hopeful,
  And kept your conscience clear.
What if your gains are meagre,
  If on Truth's golden door
You still can write, "I've wronged no man!"
  A king could write no more.

Have patience, Mr. Farmer,
  The right shall yet prevail.
The good we do is never lost,
  Truth's purpose cannot fail.
Work on! work on with patience;
  Be firm; be just; be true;
To right the wrong, to clear the way
  The world shall come to you.

Have courage, Mr. Farmer,
  For half the fight is lost
To him who lets his manhood
  On Fear's dark wing be tossed.

Thought magnifies our trouble,
  Care eats the heart away;
Think only of your blessings
  And give your joys full play.

And so we say—God bless you,
  May nothing you dismay,
Be thankful, Mr. Farmer,
  This glad Thanksgiving-day,
For health and friends and love and home
  That money could not buy;
Be thankful that the changing years
  So lightly pass you by.

Farm Topics.

A NOTE FROM SIR J. B. LAWES.

THE LEACHING OF VARIOUS SUBSTANCES THROUGH THE SOIL.

SOME substances are held mechanically, some chemically, some are decomposed, one portion is retained, another portion is washed ont. Clay has a strong affinity for various vegetable substances, many of which are highly colored; the black water from dung heaps will therefore pass through a soil and become clear. Sulphate and nuriate of ammonia and potash are decomposed in the soil, and the acids form soluble compounds with lime, which are washed away. So completely had the lime been washed away on one of our pasture experiments where very large quantities of these salts have been applied for 30 years in succession, that the crop which used to cut four or five tons of hay per acre is now reduced to almost nothing. If we apply chalk or lime the crop will be as good as ever. Common salt passes through the soil unchanged. In our three drain gauges of 20, 40 and 60 inches deep of soil, the amount of salt found in the drainage water every year is the same in quantity as that found in the surface gauge. Our annual rainfall contains very considerable quantities of salt: if our drain gauge were covered with vegetation a portion of this salt would be used by the plants, but as we have no vegetation, and common salt does not enter into combination with the soil it all passes through in the water. All the salts of nitric acid are soluble in water and do not combine with the soil, but they are taken up greedily by vegetation. The amount which leaches through the soil varies greatly. Nitrates are formed in the soil; they are also under certain circumstances destroyed in the soil. From 40 to 50 pounds of nitrogen pass through our drain gauges annually per acre. The annual amount varies with the rainfall, but we have no clear indication that the amount is becoming less from exhaustion of the nitrogen compounds in the soil. Some recent experiments appear to show that soils fix the nitrogen of the air. As the rain does not furnish more than five or six pounds of the 45 pounds of nitrogen found in the drainage water, our soils must have lost 500 or 600 pounds of nitrogen per acre since they were under experiment, and we must before long expect to find some reduction in the annual quantity removed unless the fixation of nitrogen by the soil furnishes a portion of that removed. J. B. LAWES.

Rothamsted, England.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

FARMERS' PENURIOUSNESS.—Did you ever think that the alleged "penuriousness" of many old farmers is but one of the battle-scars of a long and hard fight with fortune? This penurious, this "stingy" man began life in a time when money was very scarce and exceedingly hard to get. When he was young the richest farmers often found it difficult to obtain enough cash to pay their taxes. In the time when his habits of life were being formed, he could himself rarely get together and keep more than $15 or $20 in money in a year. A York shilling was in those days a bigger coin than our "dollar of the daddies" (very rarely seen by the daddies though) is now, and harder to be got. If the old farmer is honest, industrious and neighborly, don't give him a bad name because he looks stern, and says "No," when he is asked to subscribe five dollars for the support of "the national game." The national game, in his time, was played with a chopping axe, instead of a bat, and if he won in it, 'twas by the hardest work, and without the help of any subscriptions.

EYES NEEDED ON THE FARM—Nobody has any more need to use his eyes than the farmer who wants to make his farming successful. "What are you staring at?" said a neighbor to me, as I was looking across a field of nearly ripened wheat for a possibly profitable "variation" last August. The mining prospector travels hither and yon amongst the hills and mountains of the mineral regions, hammer in hand and pick on his back, his restless eyes ever alert for "indications." He stops and examines any cropping and every vein of the ledges and cliffs of the mountain side, and makes thousands of trials here and there, knowing that it will not do to pass anything that looks like a show. A good farmer's eye should be as sharp as a prospector's. His land, his crops, his stock, everything about his premises needs the sharp eyes of their owner constantly inspecting them as he goes about. The eyes see, but they see to profit only when the alert brain behind them sees along with them and takes close note of what it sees.

POLITICAL ECONOMY FOR FARMERS.—I think the RURAL would be improved by the introduction of a "Political Economy" column. Farmers need instruction in this new branch of science very badly. Many of them feel and see that things are not as they should be. Their feelings are roused against certain evils, especially against the various financial, manufacturing, transporting and trading "monopolies" which have sprung up all over the country. We feel that they are drawing our means away from us, but we do not understand exactly how it is done, and still less do we see the way of remedy. We hear of the Socialists and the Anarchists, of the Knights of Labor and many like organizations, but do not quite know what they are all after. We have a sort of consciousness that our interests are not quite the same, nor are the remedies for the evils we endure identical with those demanded by the organized bodies of other workingmen. The farmer who owns his land unites in his own person the qualities, the rights and the needs of both workingman and capitalist. He is a laborer and an employer of labor; he is a producer of raw material, but he is also, to some extent, a manufacturer and a dealer in both raw and manufactured goods. In the farmer, then, must be harmonized many of the conflicting demands now being voiced on all sides of us. When the farmers' needs are met, in the adjustments of the world's business, the residuum of justice unsatisfied will not be large. In the hands of American farmers resides the power which can and must stand between capital and labor to do justice to both and to enforce the rights of each. Do not the farmers, more than any other class of citizens, need to be taught the principles which underlie these great interests so far as they are yet demonstrated, and should not their leading newspaper do its part in teaching them?

ARTIFICIAL FERTILIZERS.—The use of these is increasing faster than the knowledge of how to use them, or how to make a profit out of them. Nearly every reading farmer now has some ideas about nitrogen, phosphoric acid and potash as necessary plant foods. But farmers have much to learn about the source whence they come, their cost, the cost of their manufacture, their real value when manufactured, and the possibilities of getting them more cheaply and using them separately or together in the most economical way. That they are good we know, but how to get the most good at the least cost is not yet sufficiently known.

Farm Economy.

THE LABOR QUESTION ON THE FARM.

PROF. E. M. SHELTON.

Paramount importance of good management of labor on the farm; farm hands to-day as good as in "ye olden time;" improved implements indispensable; even distribution of farm labor; advantage of being ahead of work, and of Fall plowing; value of timely work; ten hours' work enough; married, self-boarding help the best.

IN view of the fact that the prices of well-nigh all farm products have been steadily "hammered" down for years past, while the price of farm labor has during the same time at least held its own, the question of the use of labor on the farm seems to me to be one of first-class importance. Indeed it may well be doubted if there is a single qualification of the good farmer, not excepting technical knowledge of the art or familiarity with those principles which in the aggregate we call the science of agriculture, which will pay in ready cash as does that nice business sense which enables him to get all that is to be had from the labor force which he employs. I am the last one certainly to disparage or in any way belittle scientific knowledge as related to farming; but when I remember the tremendous outlay of energy involved in inverting six inches of the surface of a field in the familiar process of plowing, or in cultivating or harvesting a crop, agriculture seems as much now as it always has been, and is always likely to be, a question of doing rather than thinking—a matter chiefly of work. The farmer will always be the "horny-handed" one, "a son of toil," but every year will show a more complete subordination of his work to intelligence.

I am not of those who believe that the quality of the labor employed on the farm has degenerated in these latter days. It is true that the familiar boast of the farm hand of 20 years ago—that he could cradle four acres of wheat between "sun and sun," or in the same time chop and pile two cords of four-foot wood—is not now often heard, and when heard sounds strangely enough in presence of modern harvesters and our depleted forests. But a large proportion of our modern farm hands may safely be trusted with a mower or even a self-binder, while not infrequently I find among farm hands a man competent to operate a small steam engine or take charge of a herd of pure-bred cattle. What our farm hands have lost in one direction they have more than made up in others.

How, then, may the farmer to greatest profit utilize the physical forces at his disposal? In the first place, he must employ, and generally he must own, the improved labor-saving machinery suitable to his needs. It is futile to talk of the great cost of improved plows, cultivators and harvesters. The farmer must use these, because not to use them will cost him vastly more than the price of the machinery. It is often possible for small farmers to own jointly expensive machines like the self-binder, but such joint ownership often has its disadvantages. I am inclined to doubt if the farmer who raises 30 acres of small grain can afford not to own a self-binder. The farmer who undertakes to raise his produce by hand must sell it at the prices which machine-made products have created. He is simply trying to compete single-handed with the most potent forces of the nineteenth century.

The course of cropping should be so arranged that the labor of the farm will be evenly distributed through the year. By this means help may be engaged by the season or by the year, and day labor—the most inefficient and expensive that the farmer employs—can be measurably dispensed with. Increasing the live-stock of the farm, particularly cattle and sheep, is, under most circumstances, attended by a corresponding diminution of the hand labor required in its management. The absentee owners of the great Irish estates found no means so effectual in ridding the land of a too abundant tenantry as substituting cattle for grain. The example is not one for general emulation, but it ought to give a useful hint.

The importance of keeping ahead of the work, of pushing it instead of been constantly crowded by the pressure of important duties, cannot be too strongly insisted upon. The farmer who keeps well abreast of the season is certain to do his work with the least effort, to do it in the best manner, and to secure the largest returns for his labor. I know of no practice nearly equal to fall plowing in starting the farmer right with his work in the Spring, and there is certainly no other useful farm practice so generally neglected by American farmers. I know that it is urged that husking consumes all the time of the farmer during the fall season: but husking may be done when plowing cannot, and fall plowing, for oats and barley at least, should have the preference. The farmer who starts out in the Spring with the oat and barley ground in readiness for the seed has a tremendous leverage on the work of the entire season.

Farmers too often fail to appreciate the importance of the element of time in connection with their work. I can best show my meaning by an illustration: A field of corn may be thoroughly hoed by one man in 10 days or by five men in two days; now, if one man alone does the work, before the 10 days have passed the weeds in the unhoed portions of the field will have increased enormously in number, size and vigor, and the difficulty of eradicating them will have proportionately increased, to say nothing of the damage done the corn crop meanwhile. The man who does the work with the five men saves both time and labor, both of which are "money." I have in mind a neighbor who undertook to cut up a single field of corn single-handed. Before one-half of the field had been shocked the fodder on the remaining half was in ruins from frost, sun and rain. In some such ways as the above the forces of the farm may often be used cumulatively with great saving of time, labor and produce.

There are other matters in connection with this "labor problem," which equally with those referred to above, deserve the attention of RURAL readers, but which can be only briefly outlined in this letter:

The practice, known nowhere I believe except among farmers, of working men and teams from sun-rise till sun-down seems to me to be one that agriculture should have outgrown. An experience of 13 years with the ten-hour system upon the farm has convinced me that as much or more is accomplished, of a better quality in 10 hours than can be extorted under the old barbarous all-daylight plan. Married men are the most reliable help and these should be engaged by the year or season, and cottages should be provided for them upon the farm. The home of the farmer who boards his own help can never be a model farm home. I think of no spectacle in connection with the farm quite as unlovely and degrading to all concerned, as that presented by the farmer's wife and daughters whose lives are largely given over to the abject drudgery of cooking and washing and bed making for hired men.

Manhattau, Kan.

Dairy Husbandry.

THE REFORM OF IRISH DAIRYING.

PROFESSOR J. P. SHELDON.

Agrarian and political troubles impediments to progress; agricultural depression the source of discontent; increase of creameries; the reason; Professor Arnold in England.

THE condition of the butter trade in Ireland is causing much concern among the leading friends of agriculture in that country. The farmers are torn by various disturbing influences, and are not in a frame of mind to take united action in such a matter as dairy reform. The question of land as an element of first-rate importance in the economics of the people, involving that of the laws by which that element is at present regulated, is altogether too potent and absorbing, too desperate in its bearings, too harsh and grinding in its *modus operandi*, to admit of tenant farmers settling down into the earnest and sustained consideration which is necessary to bring about the much needed improvement in the art of butter making. The country is too much disturbed by political questions to admit of the rank and file of the people engaging quietly in the pursuit of manufacturing and commercial reforms, and the result is that no great deal of solid progress has hitherto been attained. There are, nevertheless, a number of patriotic and public-spirited men who, in the midst of chaos and uncertainty, are doing their best to bring about a state of things which will have a beneficent and lasting influence on the fiscal interests of the country.

For it cannot be denied that agricultural depression has a great deal to do with the unhappy condition of the people. I say nothing about the behavior of landlords to their tenantry, for this is a topic outside the scope of an article in an American agricultural paper; but it is, nevertheless, true that the inability of farmers to pay their way and live is at the root of most of the mischief which occurs in the beautiful Emerald Isle. The abnormally low price of everything which the Irish farmer has to sell, the most important of which is butter, is, as I have said, causing much concern to the friends of Irish agriculture, and these gentlemen, many of whom are practical farmers, the better type of landlords, and not a few professional men, and so on, are endeavoring to multiply the number of associated creameries or butter-factories. I think I have aforetime told the readers of the RURAL NEW-YORKER of the dairy education which is in progress, and of the factories which have been established in Ireland; and I have now to speak about the greatened impetus which is being given to the movement, of the reasons which are at the root of it, and of the methods which are being pursued.

The impetus and the reasons for it are closely allied. It is felt that the second or third-rate position as a butter-producing country, which Ireland feels herself to occupy, is a matter which admits of a remedy at once comprehensive and permanent. As a preliminary consideration it is well understood that the climate and soil of Ireland are unsurpassed on the face of the globe as factors in the production of the finest butter; and this at once suggests the inference that man alone is to blame for the inferior reputation Irish butter at the present time possesses. Once a train of facts such as this takes possession of the minds of those who are accounted leaders in dairy husbandry, the impetus is accounted for and the reason too. To realize the need and feasibility of improvement is the first step, and an indispensable one, in the path of progress; and this preliminary step has, I am glad to say, been well taken in the sister island. The journey to be traversed is, of course, a long and difficult one—more difficult on account of the disturbing influences I have alluded to—and can only be accomplished by careful and sustained thought, energy and perseverence. It remains to be seen whether our Irish agricultural friends, who have no warmer well-wisher than I, will be able to carry out their programme.

It is known to American readers that the British Dairy Association, which has entered on its second decade, and has already done much good to the industry it represents, has recently begun the practice of holding conferences in the more important dairy counties of England. Two of these gatherings have been held, the one in Cheshire and the other in Derbyshire. At the second one your Professor Arnold, whose name is a household word in other countries than America, was present;

and since his return home he has told his countrymen what he saw and heard amongst us. And I am glad to say that our next conference will, by invitation, be held in Dublin. The meeting will take place next June, and we may confidently hope that it will add to the impetus which has been given to the reform of Irish dairy husbandry.

IN PRAISE OF CENTRIFUGAL CREAMERS.

If pure butter is what is wanted, I think the centrifugal process is the only one by which it can be obtained. Take the milk from a dairy of cows kept in the cleanest barn that can be found, and properly cared for and fed, and milked with every possible precaution with regard to cleanliness, and run it through a centrifugal machine, and you can readily see by what is left in the machine, that the milk was far from being pure and clean. Indeed, I venture to assert that if anybody of ordinary cleanly instincts had seen the residue in the machine, and then beheld it, with his own eyes, worked into butter, nothing would induce him to eat the stuff. Now the case I have cited is exceptionally favorable for the production of pure butter; for butter is usually made from milk that comes from a "promiscuous" lot of dairies where rigid rules for cleanliness are not always observed. If any one can tell of any way of making really pure butter without the use of a centrifugal machine, I would go round the world to see how it can be done. Until this machine came into use I don't think it was ever accomplished. The fact that the centrifugal process will give more butter than any other from the same quantity of milk is of small consequence compared with the importance of the difference between pure and filthy butter. Do I call all butter filthy that is not made by this process? I do, and would not knowingly eat it. Further than this—I believe that milk, before it is sold to families, should be run through a centrifugal machine, and then the cream should be remixed with the skimmed milk, and then one would have pure "clarified" milk.

The use of the centrifugal machine is not a hobby with us, and we have no interest in their manufacture further than to buy, pay for, and use them. We use the Danish Western and Laval machines, and think one as good as the other—both are good. They are expensive and difficult to run. The process is probably the most expensive known for raising cream. Many careful men who have tried them have become disgusted with them and discarded them, and I admit that it requires patience and skill to run them: yet for all that I believe in them. W. ROWELL.

Boston, Mass.

The Herdsman.

PRINCIPLES OF BREEDING

PROFESSOR G. E. MORROW.

An animal's congenital characteristics inherited from its ancestors; its subsequent development dependent upon its environment; the fundamental principle of breeding—heredity; causes of variation; rules of practice from this principle; atavism; "freaks of nature;" animals to be selected as breeding stock.

The improvement of our domestic animals has been accomplished by breeding in accordance with a few fundamental principles. Sometimes these have not been understood by those who acted in accordance with them. Oftentimes improvement has been retarded by failure to recognize them. There is still much in relation to the art of breeding which is not understood; but, fortunately, the essentials to success are known and comparatively easily applied in practice. It is purposed to point out these fundamental principles and some of their applications, in a brief and familiar way, with the hope that especially young breeders and beginners in the business may be profited.

The characteristics which an animal possesses at birth, it has obtained from its parents. What it is to become, the extent to which its powers are to be developed, will depend very largely on its surroundings—its food and care, the climate, the help or hindrance it has from man—but it can possess no quality which, somehow, it did not receive from or through its parents.

The most casual observation shows that, as a rule, with comparatively few exceptions, the offspring resemble the parents; that like produces like. This is the one great foundation principle from which the whole science and art of breeding start. Without it there could be no certainty; no hope of any permanent improvement. This is called the law of inheritance or heredity. Any characteristic of the parent may be transmitted to the offspring, whether it be an outward, visible quality, as color or shape; or one relating to the disposition, or some internal and invisible quality; whether it be desirable or undesirable, of much or little importance. It is not true that a quality possessed by the parent will always appear in the offspring, but it may. The distinction between the words *may* and *will* should be kept in mind in all this discussion.

No two animals are exactly alike. Each animal has two parents. These have not precisely the same qualities, hence the offspring cannot exactly resemble both. Here we have one cause of variation. Experience shows that the offspring may closely resemble one parent, or it may be intermediate between the parents in the qualities in which they are unlike. We cannot foretell, with certainty, which parent will impress its distinctive characteristics on the offspring, or whether there will be an intermediate manifestation. The rule of practice from this principle of heredity is obvious. Select animals as parents which possess the characteristics desired in the offspring. First of all, the successful breeder must know what he wants; must have a definite idea of the qualities he desires. Then he will select animals possessing these as nearly as possible. If he can find but one animal with the desired characteristic, he may find this reproduced; if both parents possess it, the probabilities are great that it will be reproduced. If any animal, otherwise desirable, possesses some one objectionable quality, the wise breeder will endeavor to avoid any approach to this defect in the other parent.

An animal may receive from one of its parents a tendency which does not appear. There may be a tendency to some disease of which favorable surroundings prevent the development; or there may be a possibility of development in a certain direction, but circumstances may never cause this to be manifested. Many horses with the possibilities of developing great speed have lived and died without this fact being suspected; and so of any other quality. It will readily be seen that this undeveloped quality may descend to the offspring and appear in it, perhaps because of more favorable conditions. Experience shows us that this often happens. Frequently an animal does not closely resemble either parent in some point, but does have a close resemblance in this to a grandparent, or some still more remote ancestor. In such cases it is most natural and sensible to say the animal inherited this quality through its parent, although the parent did not apparently possess it, the characteristic having descended from the more remote ancestor.

While, in the large majority of cases, animals closely resemble one or both parents, the instances in which they more closely resemble a more remote ancestor, in some one or more characteristics, are not infrequent. Hence we modify the statement of the foundation principle so that it reads: Like produces like, or the likeness of some ancestor; the offspring resembles the parent or some more remote ancestor. This modification we call the law of reversion or atavism, or "breeding back."

Occasional instances of striking unlikeness to either near or remote ancestors are hard to explain. Monstrosities, abnormally or imperfectly developed animals are produced, and we cannot certainly tell why. We have what we call "freaks of nature," or "sports." But the number of these is comparatively small. The breeder may rely, with great confidence, on the almost certain resemblance of all the progeny of his flocks and herds either to the near or remote ancestry.

The rule of practice from all this is again easily seen. The wise breeder will endeavor to select, as breeding stock, animals which not only possess the characteristics he desires in the offspring, but which have descended from ancestors also possessing them. Experience shows that the probability of the reappearance of any quality rapidly decreases as the number of generations since it was seen increases. If both parents have any quality in common, probably the offspring will also have it. If the parents and all four grandparents have it in common, the probability of its transmission is greatly increased. If all the ancestors for five or six generations, have had this characteristic, its descent may be expected with almost absolute certainty. And it is not important whether we say it is transmitted from the near or remote ancestor.

Champaign, Ill.

(To be Continued.)

ECONOMY, NOT EXPENSE, IN LIBERAL FEEDING.—If farmers, in general, could get the heresy out of themselves that it is an expense to feed their animals well, and, on the other hand, believe the true gospel on that point—that it is economy to do so, they would soon be counting greater net gains. The same truth holds well as applied to feeding land; and modern farming proves that the cheapest way to feed the land is to feed the animals. The feeding animal pays in growth, in meat, milk or wool, and does not abstract from the manurial value of the food eaten, but rather fits it for plant food. Why can't farmers believe these truths and be free-handed instead of begrudging the salable food their animals eat, as an expense? The enlightened farmer, who said he only regretted that his well-fed cows could not healthfully digest more than he fed them, took the right view of it. The end of farming with him was to turn the products of the farm into milk, horses and wool and manure. The less machinery (animals) he had to run to make the transformation, the more he had left at the end. B.

Horseman.

BROKEN WIND, HEAVES.

F. L. KILBORN.

Broken wind or heaves in horses is a disease usually dependent upon some affection of the digestive organs, either acquired through faults in care and diet, or by inherited predisposition. The almost or quite general implication of the respiratory system is a result and not a cause of the disease. A horse with the heaves is in very much the same condition as a person with dyspepsia; while a temporary or even permanent relief may often be quite easily obtained by proper diet and care, it is doubtful if a permanent cure is ever made of a genuine case of heaves; that is to say, so that the animal is as strong and healthy as before. A recent case or a young animal may occasionally be apparently cured, but that animal will always remain more susceptible to those causes that tend to produce heaves than if he had never been previously affected.

In view of this fact, that the disease is almost, and I may say practically incurable, greater care should be exercised in its prevention, which is, after all, the only rational way of keeping free from the disease. We should constantly treat our horses as if they were quite liable to have the heaves, not by dosing with medicines, which at the best are usually of very little use except as temporary disguisers, but by carefully watching their feed and care to see that it is at all times suitable and not such as is liable to make broken-winded animals.

One of the most common causes is overfeeding on coarse, over-ripe, woody, indigestible fodder or hay, and particularly clover or other leguminous plants used for hay. Musty or dusty clover hay of poor quality is a very common cause; while hay that is over-ripe and musty, dirty, inferior or badly cured fodder of any kind is very liable to produce the disease. Allowing a hearty horse (and the appetite usually becomes ravenous as they become diseased) to eat all the hay he can stuff when standing idle, rapid driving or hard pulling when thus over-loaded or immediately after a full drink of water, and drinking large quantities of water, especially just after feeding, are all common causes. Over exertion at any time and bronchitis tend to favor or aggravate the disease. Horses with small round chests—"barrel-chested—are the most liable to become broken-winded. The disease or rather a predisposition to the disease, is inherited by the offspring of broken-winded or predisposed animals.

To prevent the disease we simply have to exercise a little more care and judgment in avoiding the causes. To be sure even under the same unfavorable treatment, all horses will not become broken-winded, some animals being apparently proof against the disease. But so many are susceptible that we cannot afford to run the risk of general exposure.

Avoid over-feeding, especially on coarse, musty, dusty, or otherwise inferior fodder, and, above all, when idle. If such fodder must be used, feed sparingly and only after being dampened. When possible, feed only clean, bright, well-cured hay, preferably Timothy that is not over-ripe. For horses that stand idle most of the time bright oat or wheat straw, with a little extra grain and linseed meal or a few roots, is preferable to hay. Also avoid severe exertion or drinking large quantities of water soon after a hearty meal. Do not breed from animals even predisposed to heaves, and thus lessen the danger by lessening the more susceptible stock.

For animals already affected treatment is palliative rather than remedial. Special care should be exercised in chosing the diet, and also as to how and when it is supplied. Give no clover hay, or musty or dusty food of any kind. Bright, clean oat straw with plenty of grain is preferable to any but the very best of Timothy hay. When uncut hay is fed it should be of the best quality, well dusted and given in small quantities, mostly at night. Well dusted uncut hay, with which ground feed may be mixed and the whole dampened, is an excellent ration. In fact, this makes one of the best of feeds for any horse, and there is in this way much less danger of overfeeding. From one to three pecks of the loose cut hay, with three to eight quarts of the ground feed, according to the size and condition of the animal, and the whole moistened, make an excellent ration for either a heavey or healthy horse. The ground feed may consist of equal parts by weight of ground oats, corn-meal, wheat-bran and one-fourth part oil or linseed-meal, mixed, or the proportions may be varied to suit circumstances.

Wherever an animal has acquired a ravenous appetite so as to eat the bedding, etc., it will be necessary to remove the litter during the day and apply a muzzle at night, and such horses should not be turned into pasture, except for one or two hours at a time, or they will even there often overload themselves.

Water should be allowed frequently, but always in moderate quantities, not to exceed one-half bucketful at one time. Offer the horse water *before* feeding the grain and not *after*, as is the common practice with many. When standing idle for a few days, reduce the feed, or, what is preferable, give daily exercise. Do not allow the horse to go to work immediately after eating. If possible, allow an intermission of one or two hours. The bowels should be kept easy by green food in Summer, and in Winter by roots, potatoes or apples, or in their absence by laxatives in small doses. Arsenic given in daily doses of four or five grains, or Fowler's solution, and continued for several weeks, is often beneficial. Unscrupulous dealers frequently resort to various methods to temporarily mask the symptoms of heaves, in order to sell a diseased animal as one apparently healthy. A common successful method is by witholding both hay and water for two or three days; but if the hay and water be resupplied the symptoms will speedily return in every case. Large doses of butter or other oleaginous substances or one or two pounds of fine shot will often hide the symptoms. Also large doses of antispasmodics, as belladonna, stramonium, etc. But the symptoms will always return as soon as the temporary effect of the dose has passed,

The Swineherd.

PIG ABORTION.

COL. F. D. CURTIS.

It is not common for sows to abort. There are causes, however, which will produce this result. Abortion is occasioned more frequently by keeping sows in an inclosure with other hogs. A RURAL subscriber has just written to me to know why his sow aborted with seven pigs. He very sensibly gave her a variety of wholesome food, so that there could not have been any cause for the trouble on account of her diet; but he, very unwisely, kept her in a small yard with a boar about a year and a half old. If this sow had been put into a field a month or two before the pigs were to be born, there would unquestionably have been no abortion. When a sow is very forward with young, sometimes a slight thing will cause inflammation or such a derangement of the fœtus as to destroy the young. In the case alluded to, a blow from the boar when eating, or a strain by slipping in attempting to get out of the way of the boar, would be sufficient. Dragging the belly over a trough, or bruising it going in and out of a pen will also cause abortion. Catching cold, owing to exposure, will also cause internal inflammation, resulting sometimes in abortion. Dogging sows heavy with young, or chasing them and otherwise over-heating are alike dangerous. Every pig breeder ought to know that constipating foods will cause abortion, and so will a frenzied condition of the mother changing her maternal instincts into savage ferocity.

There is no place on earth where a breeding sow will do so well as on a bit of pasture with a little shed for a sleeping place. There she will never have any trouble, and will always have strong and active pigs. She may require a little feeding if there is not sufficient grass, and it is always well to feed a little extra as it gives her greater growth, but she should never be fed so much that she will become fat. A fat sow is always a poor breeder and makes a poor mother. I have never had better success than this year in raising pigs. They were mostly born in the fields, and out of nearly 200 Duroc-Jerseys none has died from weakness or sickness. I find that it is always best to give sows an open range, unless the weather is too cold, and not to attempt to feed them after the pigs are born until they leave the nest and come out themselves to seek food.

I am satisfied that the instinct to eat the

placenta should not be interfered with, as it supplies just the kind of food which nature requires to replenish the system. When this is eaten a sow will remain quiet and is more docile than when she is deprived of it. I have known sows to kill and eat a live pig because of a ravenous desire for animal food, and when they have eaten the placenta they would not touch a dead pig which they had accidentally killed by lying upon it. After a sow has gratified her instincts by this kind of food she will remain quiet in her nest for hours, perhaps for a whole day and meanwhile the udders are not inflamed by an excessive flow of milk caused by extra food. A great many pigs are injured by being compelled to take milk from feverish udders; the milk itself in turn inflaming their little stomachs and making them sick. Such pigs show the bad effects of their food by rough coats and a general delicate and sickly appearance. Less care and less food than are usually bestowed on the breeding sow will cause less abortion and better success.

When a sow aborts from an accidental bruise or blow on the womb she will usually breed again all right. When abortion proceeds from congestion and acute inflammation caused by cold or fever, the risks are more. Sometimes a blow or bruise or strain will kill one pig in the womb, and a long time afterwards the balance of the litter may be born all right. Sometimes an injured pig will decay in the womb and cause abortion, or if the time of pigging is near at hand some of the pigs may be born alive and do well. Sows should never be kept in close and slippery pens. They will do best on the ground, with a dry, warm bed to go to. Sows in pig should be kept alone as much as possible, and in no more than good, thrifty order.

The Poultry Yard.

POULTRY FOR EGGS IN WINTER.

HENRY HALES.

To those who intend making poultry keeping for winter eggs a specialty the month of November is one of activity. The plans and arrangements necessary for the success of the business must be fully completed before cold weather sets in. In the first place, all houses that have previously been used must be thoroughly cleansed, whitewashed and fumigated, that all tendency to disease may be entirely removed by disinfection. Runs or yards should be dug or plowed, and where they are large enough to allow grass to thrive, grass seed should be liberally sowed. Broken windows should be all reglazed, and all cracks or holes in the wood-work should be promptly stopped. With all this shutting out of outside drafts, provision must be made to admit plenty of air and afford good ventilation whenever the weather is moderate enough to allow it, and ventilators near the ceilings should never be closed except in extremely cold weather, and then only for as short a time as possible, and this in houses without artificial heat. Where there is any heating apparatus, never close the ventilators entirely. Too much stress cannot be laid on this matter of cleanliness and ventilation; for, no matter what fowls are kept, no good results can be expected with carelessness in these matters.

Pullets hatched early in Spring are much better for winter laying than hens, as they will commence in October or November, and keep on laying; while hens do not commence so early; some, indeed, do not lay till February, when eggs are getting cheaper. Internal arrangements for making the birds comfortable and satisfied are of much more importance than many people think. Some persons imagine that because they are hens they *must* lay eggs; but a great deal can be done by coaxing. Change a hen from one house to another and it will be found that she always stops laying till she gets settled down in her new quarters. This shows that her good-will and comfort must be consulted. Good, clean nests in quiet places are appreciated. Avoid over-crowding. More profit can be made from a small flock well kept than from a large one crowded too closely together, no matter how well they may be fed. If one has room enough, the number of hens and of houses and yards may be increased indefinitely.

It must be borne in mind that only liberal feeding will produce an ample number of egg food. Hens must have the material for making a plentiful supply of eggs, and herein lies one of the secrets of making hens lay in the Winter. During the Spring, Nature supplies much of the food that is conducive to egg production, in the form of worms, bugs, flies and tender vegetation, and when we try to produce eggs two or three months before Nature is ready with her natural food, we must supply the deficiency. Avoid all kinds of nostrums claiming to be egg-producing powders or foods, and feed good sweet grain—no damaged stuffs. A morning's meal should be of boiled potatoes mashed up with wheat middlings and corn meal, or varied with oatmeal at times for a change Feed in troughs, so that the stock cannot get into and soil the feed. Give them all they will eat up clean, and no more—at noon a little meat, such as haslets, "graves" from the packing-house, etc. The "graves" come pressed into hard cakes. These should be broken to pieces with an old axe and soaked in cold water till they fall to pieces. Then the stuff can be chopped up fine; but never give it to them in the house in such large pieces that they can drabble it through the dirt, as that is one of the easiest ways to make fowls sick The evening meal should be grain—wheat is best—with some corn mixed with it. A little oats or buckwheat is very good for a change; but do not rely on them alone. Cabbages should be fed when there is no grass; in fact, almost any vegetable is relished, such as turnips, onions, or carrots. Many people recommend throwing corn among cut hay or straw to make fowls scratch for the sake of exercise. This would be a good thing to do outside when the birds can get out, but in the house there is danger of their eating dirt with it. All such feeding, however good, must be scrupulously clean. When cabbages are given, they should be hung up by the stalk within easy reach.

Field Crops.

Experiment Grounds of the Rural New-Yorker.

A NEW WAY TO MULCH POTATOES.

VALLEY MULCHING.—The old RURAL method of mulching potatoes is sometimes very successful and at other times useless or harmful. The effect depends upon the soil and season. When the early Spring is backward and wet, the mulch keeps the soil cold; the seed pieces are delayed in sprouting and an imperfect stand is the result. What is wanted is a mulch that will conserve moisture and yet not intercept the warming rays of the sun. The "valley" system accomplishes this. Whether it is practicable or profitable each must judge for himself. Following is an account of our

COMPARATIVE TESTS.

The soil (a much impoverished, sandy loam) was plowed, raked, and leveled the same as if grass seed were to be sown, as shown by the line *a*, Fig. 430. The seed pieces (two eyes)

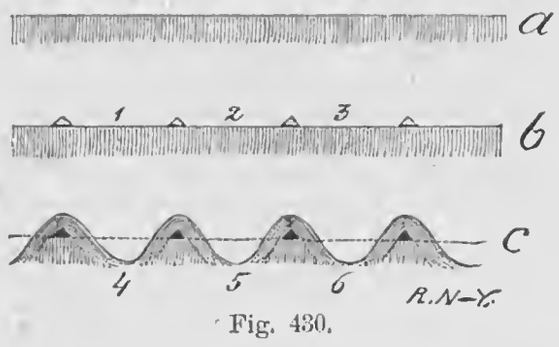

Fig. 430.

were then placed *on* the soil one foot apart in rows three feet apart, as shown at *b*. These pieces were then lightly covered with soil hoed from between the rows (1, 2, 3,) and at the rate of 1,000 pounds per acre of Baker's potato fertilizer strewn evenly over it. Then more soil was hoed over the fertilizer until continuous hills five inches high were formed, as shown at *c*, forming the valleys, as shown at 4, 5, 6. The valleys were then filled with a mulch of coarse straw and hay that had been raked up into cocks from a part of the field where it had lain all Winter, thus, filling the valleys, as shown at the dotted line. The design is that such plots are not to be cultivated during the entire season. If the mulching material is old, few seeds will sprout *in* the mulch, while those that sprout *beneath* it will be smothered. The weeds that grow on top of the hills may be pulled up. But the vines very soon cover the hills, forming a shade not favorable to their growth. The yield of potatoes was 45 pounds, which was at the rate of 352 bushels to the acre, 60 per cent. of which were marketable as to size.

If it were desirable to try this system on a large scale, a small plow run both ways, or a shovel plow would serve to turn furrows over the pieces, leaving the valleys to be mulched. In the

SECOND experiment, which is by no means new, the pieces were placed on the top of the leveled soil as before, and the same kind of mulch spread over them five inches high directly over the pieces and sloping gradually towards the other rows. Upon this mulch the same quantity of the same fertilizer was sown. The yield was at the rate of 330 bushels to the acre. In this trial there were 316 tubers (45 pounds), of which 162 were of marketable size. Many, however, were injured by grubs of the May Beetle and wire-worm. The next test was the Rural's trench-mulch system, well known to our readers, using the same quantity of the same fertilizer. The yield was 316 potatoes (31¾ pounds), of which 156 were marketable. This was at the rate of 276.83 bushels to the acre.

ANOTHER trench without mulch, and fertilized with the same manure, at the rate of 1,200 pounds to the acre, yielded at the rate of 278.66 bushels to the acre, there being 314 tubers (38 pounds), 146 marketable.

THE fertility of the soil is shown by the yield of two trenches that were not fertilized. The first yielded 162 potatoes (12¼ pounds), of which 54 were of marketable size, though very scabby. This is at the rate of but 91.66 bushels to the acre. The second unfertilized trench yielded 156 tubers (15½ pounds), of which 60 were marketable as to size, and also much injured by scab. This is at the rate of 113.66 bushels to the acre.

The average yield of the unmanured trenches was 102.66 bushels per acre. The trench (not mulched) which received 1,200 pounds of fertilizer yielded at the rate of 278.66, an increase over the unfertilized trenches of 176 bushels. The trench which was mulched (old Rural trench-mulch plan) and given 1,000 pounds of fertilizer, gave an increase over the unmanured plots of 174.18 bushels; the surface mulching an increase of 228.66 bushels, and the "Valley" mulching an increase of 250.66 bushels to the acre.

We shall try the Valley method again next year on a larger scale. The philosophy of the method seems sensible enough. About a foot of soil in width directly over the pieces is without any mulch, and the mellow, loose soil receives the air, the sun's rays and the rain, while the mulch in the valleys must assist in retaining the moisture so received for the benefit of the roots until the growth of the tops covers all.

* * *

SOUTH AMERICAN WILD POTATO.

OUR first specimens of this variety were received from Charles E. Brown of Yarmouth, Nova Scotia, who had raised it for two years without much improvement. We planted three hills, using a whole tuber for each, April 12. The vines were dead August 14. The yield was 60 potatoes which weighed 1¾ pound or at the rate of 141 bushels to the acre. The engraving, Fig. 431, shows the average size. All were of the same shape. There were two decayed tubers. The skin is reddish-purple, the flesh, when cooked, pinkish, the quality sweet and good. The vines were much the same as those of other potatoes. Crossing this potato with cultivated kinds might produce curious results. It did not bear any fruit. This potato is quite different from any of the other wild species we have seen, and we have raised the several kinds found by Mr. Lemmon in the Rockies.

Fig. 431.

JAPAN CLOVER.

THE following note is published for the benefit of several who have asked where Japan Clover seeds can be purchased since it is not offered in seedsmen's catalogues:

"Japan Clover made its appearance on my farm about nine years ago. Its introduction in this section of the South still remains a mystery; but for grazing we have nothing that will compare with it. It comes early in the Spring and remains till late in the Fall. The proper time to sow is the Fall and Winter; then it comes up early in the Spring. We do not sow it here, as it comes up spontaneously all over the fields that are not cultivated. Should any of your subscribers wish to make a trial, I can furnish small quantities of seed.

E. DASHIELL.

Williston, Fayette Co., Tenn."

Floricultural.

THE WINDOW GARDEN.

WILLIAM FALCONER.

ATTEND to the wants of the plants so far as watering, cleaning and ventilating are concerned. Keep geraniums, oxalises, nasturtiums, petunias and other gay plants in sunny places to prolong their blooming season. If your Roman hyacinths are well rooted, bring in a pot or two to a moderately warm room to get them into bloom for Christmas; but if they are not well rooted don't try to force them, else they will be very poor flowers. Keep a pot or two of musk growing; also some lemon-scented verbena. Most old folks love them both.

PALMS are capital house plants providing you save them from furnace heat and gas, and even these they will stand for some weeks without showing much injury. The Livingstonas and Kentias are, I think, about the most desirable. They don't want sunshine, but they do like warmth and moisture. Seaforthias grow too quickly, and the commoner Chamærops lack beauty or elegance.

DRACÆNAS.—The "colored"-leaved kinds are pretty useful for a time, but after a while they lose their lower leaves and look "leggy." When this is the case I make a notch nearly all the way around the stem and close up under the leaves, and around the incision tie some swamp moss mixed with sand, and moisten it two or three times daily. In a few weeks young roots will appear all through the moss, then remove the top, and its new roots pot and treat as new plants. Dracæna fragrans is a large, green-leaved kind, and one of the very best plants I know of for continuing a long time in good condition inside a dwelling room.

GOOD GREEN-LEAVED PLANTS.—The common or variegated-leaved aspidistra lasts longer in healthy condition inside a dwelling room than any other decorative plant I know of, and if need be we can safely winter it in a cold-pit or cold-frame. Then we have the English ivy, which is a hardy vine; the rubber plant, large-leaved begonias, sweet bay, and palms, screw pines and ferns.

FERNS.—No matter whether the ferns are in vigorous growth or at rest, in a warm or a cool room, the soil in which they are growing should always be moderately moist. Of course, those that are in the most vigorous growth should get the most water, and those that are at rest the least. Aspidium falcatum has thick, glossy leaves, and is the best of all for room decoration. But we can have maiden hair, onychium, nephrolepis, staghorn, silver-leaved pteris, and some others in very good condition. Where room is limited and many ferns cannot be accommodated, you may cut over your common maiden hair and onychium ferns and set them aside in your cellar over Winter, but be careful that neither frost nor drought reaches them there.

FERN CASES are usually set in the hallway or inside sunless windows, and are filled with ferns, club mosses, cyperuds, rex begonias, and red or white nerved fittonias. Don't keep them soaking wet. They should be thoroughly well drained by means of a layer of rubble in the bottom and a faucet at one lower corner to lead off the water. The atmosphere should be kept moist and the plants be sprinkled gently from an atomizer, syringe or finely bored water-pot rose every day or two, but not enough water should be given to wet the soil much. The three chief points to observe in fern-case gardening are, not to overwet the plants or soil; to ventilate continuously by tilting up the lid a little, and to wipe dry the glass casing inside daily.

CHRYSANTHEMUMS.—Those that have been blooming out-of doors may be cut over, and a thick mulching of leaves or litter placed over the roots. Or it will be safer to lift and bring them into a cool cellar till Spring; but the roots must be kept moist during Winter. Those in pots may also be wintered in a cool cellar.

FLOWER ROOTS.—I winter cannas, dahlias, four-o'clocks, Caladium esculentum and Madeira Vines on wide, airy shelves in a warm cellar. Gladiolus and tigridia bulbs I keep on shelves or in boxes in a dry, moderately cool room, but where frost never enters. Gloxinias, fancy-leaved caladiums and gesnerias may be left in the pots in which they had been grown, and kept in a room, cellar, or elsewhere where the temperature never falls below 50 degrees. Tuberoses like warm, dry winter-quarters. Tuberous begonias and montbretias like a cool, but frost-proof place.

COLD-FRAMES.—Have them well banked around with coal ashes, dry leaves or other warm material, and afford ready means for water to pass away from about them. While a few degrees of frost may not visibly hurt

violets, pansies and polyanthuses, it does them no good; hence, don't subject them to it. Uncover them in warm, mild weather; tilt up the sashes in bright, sunny weather, even if it freezes a little; but shut up early and keep in a little sun-heat. Cover over the sashes with straw mats, Russia mats, thatch, straw or other available material to exclude hard frost, and it will greatly add to the warmth of the coverings if you have tight half-inch pine shutters to lay over the covering to keep all snug and dry. But avoid coddling your plants, else they will damp or rot off, bleach or spindle, and become unable to yield good flowers. Occasionally stir the soil between the plants to keep it sweet and the plants healthy, and remove all decaying leaves and the like from the frames.

THE GREENHOUSE.—If you have only one greenhouse and in it only one compartment, so arrange your plants that the poinsettias, crotons, draccenas and other heat-loving plants shall be at the end next the fire-place, and the carnations, cyclamens, cytisus, primroses and others requiring low temperature, at the cool end. Don't be too kind and keep the house extra snug and warm, as such is very injurious to your plants. Hang up a thermometer about the middle of your house, and let it indicate an average temperature of 50 degrees; this will give five degrees higher at the warm end and five degrees lower at the cool end. Ventilate in fine weather. Open the ventilators early and only a little at a time, and shut up early in the afternoon, so as to keep in a little of the sun heat and save firing. By syringing the large-leaved plants—but never the flowers—and wetting the benches and paths, maintain a damp atmosphere; but never sprinkle the hot pipes so as to raise steam.

Pomological.

CROSSING OF ORCHARD FRUITS.

PROFESSOR J. L. BUDD.

OVER large areas of our country the desirability of securing systematic crosses of our orchard fruits with a view to combining the season and quality of one variety with the perfect foliage and hardiness of tree of another, is not questioned at this time by our thoughtful fruit growers. Hoping to enlist the attention of a few readers of the RURAL and induce them to plan some work of this kind for their next season of blossoms, these brief notes on crosses effected on the college grounds the past season are penciled.

SELECTION OF PARENTS.—Of course, the selection of parents will depend on climate and the end to be gained by the proposed cross. With us the primal thought is to secure varieties hardier in the tree, and more perfect in leaf than the Willow or Roman Stem Apple, the Early Richmond or English Morello Cherry or the Lombard or any other West Europe plum. Hence we selected for mother varieties of the apple such undoubted iron-clads as Hibernal, Lieby, Anis, Antonovka, and Longfield, and crossed the blossoms with pollen of Grimes's Golden, Roman Stem, Northern Spy, etc. Among cherries we selected for the female part of the the cross some really good varieties of the Griotte type introduced from Orel, Russia, and crossed them with the sweet and half-sweet varieties of North Silesia. Again, to increase the size of the prospective trees to be grown from pits, we crossed the Large Montmorency on the Dwarf Vladimir Cherry, and on the dwarf sort known as Schatten Amarelle. With plums our crosses as yet are of varieties of the native sorts, the purpose being to secure combinations of desirable points in tree and fruit. As instances, De Soto was crossed with a strong-growing native sort known as Speer, and also with Maquoketa, the best in size and quality of fruit of the Chickasaw plums, but not quite hardy in tree. Again, Wolf Plum, a native sort with some trace of foreign blood, and not quite good enough in quality of fruit, was crossed with Maquoketa and with the Yellow Mirabelle.

SAVING THE POLLEN.—The success of crosses of the apple, cherry, and plum, will depend largely on having a supply of pollen at the exact nick of time when the stigmas are coated with the needed nectar to receive it. As practiced here, pollen-gathering is a simple and rapid work. When the blossoms of the varieties of apple, pear, cherry, or plum we intend to use as male parents are fully expanded, a student is set at work plucking the nearly-ripened anthers, with filaments attached, with thumb and finger, and dropping them into a new, clean tin cup. No attempt is made to avoid plucking the pistils also, as they do no harm, and sorting out the stamens would make slower work. In an hour enough pollen can be gathered in this way to fertilize a thousand or more blossoms. After gathering, the pollen is placed in a warm, dry room for drying and the bursting of the cells of the anthers. If kept dry in this form it retains its potency for many days, and may be sent long distances by mail. Hence in all cases where a given female parent expands its blossoms earlier than the variety we wish to use for fertilizing its blossoms, we can send to a friend farther south for the pollen.

THE SACKS.—I do not like paper sacks. Thin, white muslin sacks, four inches long and four inches at the mouth by 3½ inches at the top, I have found to answer the purpose best. In practice I find them to handle much better if widest at the bottom. With a sewing machine 1,000 are soon made. We fasten them in place with pins, as strings are too bothersome in putting on and taking off.

REMOVING THE ANTHERS.—The right time to remove the anthers from the blossoms to be pollenized is when, now and then, a flower of the tree is fully expanded. With a pair of small forceps they can be nipped off rapidly after a little practice. Cover with a sack at once after the anthers are removed. We usually take the anthers from the two strongest buds of a cluster, and pinch off the remaining ones.

POLLEATING.—As the development of the stigmas depends largely on temperature, etc., we remove the anthers one day and touch the stigmas with the pollen brush on the two succeeding days. We find as many stigmas in condition for pollen reception the second day as the first. If the brush is slightly moistened, it takes up the pollen from the dish readily, and it can be applied very rapidly. The boy who takes off and replaces the caps has the main work. At the second application of pollen we believe it well pays to touch the base of the blossom with weak arsenic water or London-purple, as we find the coddling moth, curculio, etc., specially apt to get under the cloth caps. About five days after the blossoms have been fertilized, the cloth caps should be removed and the forming fruits covered with (pinned on) pieces of mosquito bar, to remain until the fruit is ready to be gathered.

OUR RELATIVE SUCCESS.—The season with us has been specially unfavorable, yet we have saved seeds of every cross made upon the apple except the Wild Crab, and from every cherry and plum cross fertilized. In some cases the crossed specimens were the only ones retained on the trees during the frost and storms of the season of blossoming.

MODIFICATION OF FRUIT AND SEED.—This can be only noticed at this time. In two or three cases the change of fruit was remarkable. As an instance, the Longfield apple fertilized by Roman Stem was wholly changed in form, and some of the specimens had every external mark of the Roman Stem, but the flesh was not appreciably changed in texture or flavor.

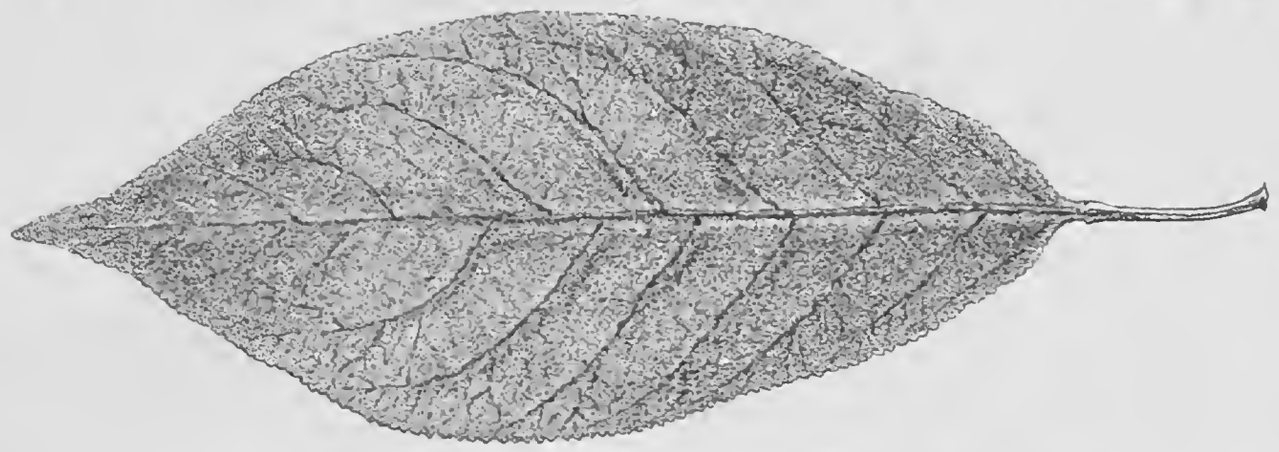
Ames, Iowa.

KELSEY'S PLUM.

OUR illustration of Kelsey's Japan Plum, Fig. 432, is an accurate portrait of a specimen sent to us by P. J. Berckmans of Augusta, Ga. September 20. Mr. Berckmans writes:

"I send you a specimen of Kelsey's Japan Plum, the first I have so far had to arrive at full development. Some specimens injured by birds matured a month since, and were quite purple in color. To prevent further injury from the same source, I had mosquito netting put around the fruit, which may have prevented the full coloring. The trees are very vigorous and healthy. Fruit set in 1885 upon trees budded in June, 1884, but was blown off, and failed, therefore, to show its size."

This plum was eaten by the writer of this note on September 26, as the halves had been carefully preserved after they had been sketched. The skin was very firm, without any bitterness, and of a yellowish-green color. The flesh was thick (as the engraving shows), sweet, juicy, meaty and tender. It was not so sprightly as some of the best of well-known plums. In this respect it would probably have improved, had it been allowed to ripen more fully. This plum, to speak with all needed conservatism, promises to be a first-rate acquisition. The first tree was imported by Mr. Kelsey, of California, after whom it is named. It probably has a Japanese name, by which, of course, when known, it should be called. It is said to be exceedingly productive in California, and to bear when trees are three years of age or less. Sometimes the plums are nine inches in circumference. The pit is relatively very small, as our engraving shows. It is said to excel other plums for canning, and when dried to equal the best dried prunes. Unquestionably this plum will prove a good shipper on account of its firm skin and solid flesh. In so far as we can ascertain, the tree is hardy, thrifty and healthy. Our engravings show true to nature the leaf, the entire fruit, a half section showing the thickness of the flesh, and finally the small pit.



KELSEY'S JAPAN PLUM. From Nature. Fig. 432.

Horticultural.

IMPROVING OLD CURRANT BUSHES.

IN nearly every farmer's garden there are a few bushes of the common red currant, many of which have been growing in the same spot so long a time that they have become nearly worthless, the fruit being very small and scattering on the stems. The bushes are mere clumps, the roots have become so matted together that there is little space left for new roots to form. Manure spread around such bushes can be of very little benefit to them on account of there being little chance for new roots to grow. The question arises what can be done in the way of improving such bushes. Trimming off all of the old wood in the Fall and allowing but four or five shoots to grow the following Spring is often recommended; but this is of doubtful expediency, as the roots, being so matted together, can only with great difficulty provide nourishment for the new growth. The benefit derived can be of but short duration.

I have found it a much better method to dig up the roots, and after dividing them, reset in a new place. One such clump often makes from 10 to 20 roots, each of which will, the following Spring, send up several strong, thrifty shoots. Several years ago I divided several of such clumps, giving them good cultivation. The second year thereafter they produced a good crop of currants that were so very large that it was difficult to distinguish them from the finest Cherry Currants. M. H. B.

What Others Say.

FERTILIZER ANALYSES.—Bulletin No. 40, just issued by the New Jersey Agricultural Experiment Station, gives upwards of 150 analyses of different chemical fertilizers. These analyses show the amount of phosphoric acid, potash and nitrogen each contains. They represent the retail cash cost of these plant foods *before* the crude materials containing them have been mixed with each other. These valuations, therefore, are not intended to cover the expenses of mixing, bagging and transporting fertilizers from the factory to the farms. If, for example, the Station estimates the value of a given brand at $40 per ton, it means that for $40 a farmer can buy enough *unmixed material* to furnish the amount of nitrogen, phosphoric acid and potash shown by analysis to be present in that brand. The farmer must add to the $40 the expenses of mixing the crude materials with each other, packing the mixture into bags, cost of bags and freighting it to his farm. Many analyses are given which do not present the selling price at all, so that we do not see that they are of any present value to the farmer. In considering the differences between the Station valuations and the selling price at the factories, one important fact is liable to be overlooked. For instance, a certain brand of corn manure is valued at $40 per ton. The selling price is $44. Here we have a difference of four dollars. This difference amounts to 10 per cent. Another brand is valued by the Station at $20 per ton. It costs $24 at the factory—a difference also of four dollars. But this difference amounts to 20 per cent. Then, again, the farmer should consider that it costs just as much to transport and spread over the land the $20 fertilizer as it does the $40 fertilizer. Those of our readers who desire this bulletin may apply to the Director, Prof. George H. Cook, New Brunswick, N. J. But the Station is under no obligation to furnish copies to applicants outside of New Jersey.

VARIATIONS IN RICHNESS OF JERSEY MILK.—John E. Parmly writes to the American Dairyman that there are some families of Jersey cows that give quite a large volume of milk, and at the same time make good records of performance as butter cows. He has one, "Lily Scituate," that in seven days in June last, gave 366½ pounds of milk, which made 24 pounds 9½ ounces of butter. This would show that 14¾ pounds of milk made a pound of butter. He has another cow that gave 336 pounds of milk that made 19 pounds of butter; another that gave 43 pounds of milk per day and made 18 pounds nine ounces of butter per week; another that, at four years of age, gave 39 pounds of milk per day and made 17½ pounds of butter per week. So it appears that the four cows made 80½ pounds of butter in a week. As the cows of the country run, it would require a drove of about 16 of them to produce so much butter. Can a farmer afford to feed 16 cows to do the work of four? Money will buy the better sort, and care and feed will make them perform. Then consider the value of the calves of such cows!

PROFIT IN SMALL FRUITS.—Editor Cheever says in the N. E. Farmer, that if we would make money raising small fruits we must go into the business to stay, not for a year, but for many years or for life. There will be bad years for fruit growers as well as for producers of any other products, but those who learn the business most thoroughly and who establish a name for quality of products and for fair dealing, will be the ones to succeed in the long run. They will have to sell with lit

tle profit some years, when everybody else i in it, but they will make money when others fail through ignorance of the business or because of periodical under-production. It is the earnest workers and steady plodders, after all, who come out ahead in the struggle for existence.

THE GERM THEORY.—In his opening address at the Royal Veterinary College, Professor Robertson remarked that in both human and veterinary medicine the elaboration of the germ theory of Pasteur in its earlier triumphs in the department of surgery is likely to be surpassed by what we may reasonably expect will yet be achieved in the domain of medicine. In preventive medicine as applied to animals the recognition of the specifidity of many of those diseases which have attracted attention through their destructiveness, has given us a solidity of basis in dealing with them which was unattainable while they continued to be regarded as the result of variable influences, sanitary and dietetic; while the doctrine of the production of a protective material, by the cultivation or modification of the specific virus of these diseases, although not yet undoubtedly demonstrated in all its fullness, has, from what has been already wrought out, clearly indicated that a new field in pathological inquiry has been opened out, and that results of marvelous and far-reaching influence, almost beyond our conception, seem shadowed more or less distinctly around us. He touched upon the relations of these speculations and ideas to the practical application of medicine to men and animals, and showed that if disease is to be treated, or its causes investigated with a view to prevention, work of essentially similar nature requires to be done, whether men or cattle are the subjects of our operations.

A NEW METHOD OF GLAZING SASH.—Peter Henderson says that it is well known that all glass now (both in portable sashes and in fixed greenhouses), is simply imbedded in putty, and kept in place by glazier's points, no putty now being used on top, as was formerly done. It has been found that when the glass lies on the sash-bar thus imbedded the putty soon rots or wears out, and water gets in and not only loosens the glass but rots the bar as well. A most simple plan to obviate this is to pour along the junction of the bar with the glass a thin line of white lead in oil, over which is shaken dry white sand. This hardens and makes a cement that effectually checks all leakage. It is quickly done.

RURAL LIFE NOTES.

ANNIE L. JACK, of Ontario, Canada, writing to Our Country Home, says that she valnes Brinckle's Orange the most of her yellow raspberries. This is tender in the Northern States if not protected by snow. The new Golden Queen, she says, bids fair to rival it, having stood the Winter well.....

W. H. BULL, of Massachusetts, according to the New York Tribune, raises water-cress in the greenhouse for market during the Winter, putting it up in bunches weighing about two ounces or loosely in quart strawberry boxes, the former bringing 60 cents a dozen and the latter about 10 cents each. He takes cuttings from brook plants in the Fall, and roots them in the well-enriched earth of the greenhouse bench. These root at once and if well watered yield a succession of tender cuttings all Winter.....

WALDO F. BROWN expresses the opinion, in the above paper that there is no more contemptible meanness practised than the one of making misrepresentations as to the profits of the silk business and the ease with which it can be managed, that they may induce poor widows to send their hard-earned dollars, when the result is almost certain to be loss and disappointment.....

HE cites several cases: A farmer near him in Ohio owned three acres of land. These he filled with mulberry trees. He sent off for eggs and hatched out a large quantity of worms, turning his house into a cocoonery. His income from them was represented by a 0, and it cost him half the price of his land to grub out the mulberry trees.....

FOR several years past we have never fed our poultry either shells or lime, and they are always confined. Bone meal answers every purpose We never have soft-shelled eggs and rarely have a case of sickness.....

A WRITER in the Indiana Farmer believes that while there is a place for all breeds, the Herefords may claim a first place for cheap beef, early beef and best beef. He considers them the poor man's beef cattle.

MR. STAHL says that he knows of many daughters, hard-working and economical, whose hardest task is to ask the father for money for a pair of shoes or a dress.., ...

A FARMER near the Rural Grounds has lost a number of pigs this year. He has fed them a great deal of sweet corn that was caught by the frost last year, and was, consequently, somewhat decayed and decidedly musty. He does not attribute their sickness to this food, however, but to the wicked work of witches. This is the truth: and he is looked upon, not only as a hard-working, industrious man, but as a farmer of very good judgment.

I THINK it is a perfect shame that all the illustrated papers portray the farmer as such a distressed ignoramus. So says Mrs. A. E. M. Carman.....

STEEP the shingles in thin lime-wash for a few hours. Each bundle of shingles may be immersed in the lime and then taken out to drain, when they will have absorbed enough of the lime to coagulate the albumen of the wood, which is the part that decomposes first. So says Henry Stewart. Or the shingles may be steeped in crude petroleum. It pays well..

CROWDING animals in close quarters is always conducive to disease, whether the animals be swine, sheep, fowls or human beings. Overfeeding is another foremost cause of disease—and finally faulty breeding.....

DR. LORING, at a late farmers' meeting, as reported in the New England Farmer, takes a somewhat gloomy view of the situation of the Massachusetts dairy farmer. He says it has come to the point that cows are kept for the manure they make rather than for their other products, just as the Connecticut river tobacco growers formerly fed oxen at a loss of $12 per head every Winter to get manure to run their farms with in Summer. Animals are usually, he says, a costly necessity on New England farms. He would himself keep but a single cow for family use if he could keep up the fertility of his land by other means.....

DR. LORING thought the old average of about five quarts per day per cow by the year had not been much advanced these later years, and at present prices for milk the business cannot pay except in the manure. The great yields of 30 quarts per day and over were rather above his comprehension. He would gladly go as far as San Francisco to pay his respects to a cow of that description. Making veal is poorer business than making milk. He would prefer his own cows would never have calves, but they are a necessary evil.....

HE thinks no better butter or cheese can be made by machinery and modern methods than the old farmers' wives of former generations made by their simple methods. He has seen repeated evidences of this in his own county, where wealthy merchants farming for pleasure and with all their modern methods, had failed in taking the prizes at the cattle shows away from the old women of the farm dairies, who had never so much as heard of a thermometer, but stuck their fingers in the cream to test the temperature.....

THE Holstein cow, according to Mr. Houghton's statement, as also reported in the N. E. Farmer, could convert a greater portion of her food into milk and butter than cows of other breeds; and if fed as they should be, with a liberal hand, the Holsteins would give much larger profits. The two-year-old heifers, he says, give more than mature cows of the average farm herd. They excel the Jerseys, both as milk-producers and as butter-makers. They are small eaters for their size.....

OIL the harness now.....

THE Farm Journal says that in setting a gate post it is a good plan to fill the hole with gravel and small stones and then run in thin cement mortar. "The post will never rot." We don't care much whether the hole is filled with gravel, sand or soil. Pack it firmly and fill in at the top with lime, heaping it somewhat about the post. This will preserve the post as well as cement.....

IF a calf, colt or pig is placed in a dark stall or box at a distance from the light, and there is put alongside a young, growing plant, we can rest assured, says the Indiana Farmer, that the dwarfed and sickly aspect sure to overtake the plant will as surely, though to the average observer less obviously, overtake the young animal .....

MR. J. MCLAIN SMITH, of Ohio, having in the Ohio Farmer said that the only breeds the cows of which were entitled to the appellation of "general-purpose cows" were the Short-horns, Devons, Holstein-Friesian, and Red Polls, another correspondent of the same paper held that he ought to admit to the ring the Herefords. This would leave among the "special-purpose breeds" only the Jerseys, Guernseys and Ayrshires. The classification is a mere question of opinion for which no man can be called to account, any more than for his tastes .....

WITH regard to docking horses, the (London) Live Stock Journal says that there can be no doubt that in order to be performed in a way that causes a minimum of cruelty the operation must be conducted by a thoroughly trained veterinary surgeon. The other day at Chorley, England, two parties were fined for cruelty in docking a horse—the ground of thi judgment being that the operation had not been shown to be necessary.....

A STANDARD for a good cow is said to be 600 gallons of milk a year, and of this there should be 10 per cent cream.....

STRONG unbleached muslin is excellent in place of glass for poultry houses or chicken runs, and is much less expensive. ....

PLENTY of rubbing will produce a good coat on your horse. "Elbow grease" opens the pores, softens the skin and promotes the general health.....

A GENIUS in Troy, N. Y., has just invented a stove that saves tree-quarters of the wood, while the ashes it makes pay for the remainder. Name? Can't give it yet.... .....

Everywhere.

RURAL SPECIAL REPORTS.

Arizona.

DUDLEYVILLE, Pinal Co., Oct. 26.—We are having nice weather here. We had frost on October 14, but we have nice peaches on the trees yet. Crops good. Times are hard; but we expect better now because the Apache war is over. None on the war path now in Arizona. My farm joins the reservation, and I know. W. A. L.

Illinois.

CHICAGO, Cook Co., November 10.—One of the largest movers of grain in Central Iowa writes me to-day to this effect: "We are buying wheat every day, much of it under 50 cents a bushel, which leaves the farmer a very small margin for his labor, and it seems to us that with this condition of things he will have very little money to spend." In some portions of Central Dakota the crops are so poor that farmers have a hard lookout for a bare existence this Winter I have another report made from Lacrosse as a base and covering a distance of 400 miles through Southern Minnesota and into Dakota. For the first 200 miles the report says the farmers are not depending on any one kind of grain, but they raise a good deal of stock, are generally out of debt, and apparently get along about as well as ever: but for the next 200 miles the situation is different. A very large class of the settlers are in debt for their land and machinery. The flax crop has been a great help to them for the past two years, but the present price is so low that farmers will not attempt to grow it in the future as they have in the past. Railroad freights have declined considerably the past year, and everything the farmer buys is reduced to a price which has had the tendency to keep him and meet the low price of grain. But my correspondent sums it all up that if there is not a change for the better in the prices of grain, seeds and live stock, the average farmer, in the far Northwest at least, will have to go to the wall. Four-fifths of the flax, nearly all the Timothy seed and fifty per cent. of the wheat is in. We look for good receipts of grain as soon as the ground freezes up, and do not think farmers have held back on the crop on account of prices at any time. It is now nearly four weeks since we have had any rain that amounts to anything; but we have not had any general rain in the Northwest this Fall. A year ago at this date the ground was thoroughly soaked everywhere, and up until to-day the whole State of Illinois is as dry as it was in July and August. We have had a period of remarkably fine weather for gathering the corn crop, and for a series of years it was never probably in as dry a condition to crib and ship as it is to-day. Ohio and Indiana are the freest shippers of new corn. There seems to be very little disposition at present among farmers in the other States in the corn belt to move new corn. The strike at the stock-yards of Chicago among the packing-houses is completely demoralizing the stock interests of the Northwest. Farmers cannot ship, packers do not want to buy, and the general stock trade is at a standstill. There is not the slightest doubt but that the packing interests will be successful, and that when business resumes again it will be a long time before another strike occurs. R. N.

ELGIN, Kane Co., Nov. 8.—Butter was a little firmer to-day under light offerings and colder weather. Regular sales on the Call Board were made at 27½ to 27¾ cents. Part skim cheese at 6½ cents; full cream cheddars 11½ to 12 cents; flats at 10½ to 11½ cents, closing firm for all grades. S. A. T.

Iowa.

OSAGE, Mitchell Co., Oct. 31.—Some say the crops of grain and vegetables were fair, though the straw was light and short. Others think the crops very light, save only corn. At our county fair very few vegetables were on exhibition, because they failed to grow to an ordinary size. Potato crop very short. The prices rule so low that some charge it to poor crops, that is, the crops look lighter than they are. Ours is largely a dairying section. Grain raising will meet the wants of the family with a little to spare. Prices unchanged. All Summer there was a drought. L. S. E.

New York.

ALBANY, Albany Co., Nov. 8.—There is an improvement in the live stock business of the East. The receipts at West Albany during October were the largest of the year, numbering 3,594 car-loads. Old-time buyers are again seen about the stock-yards, and new life seems to move an interest that a year ago was on the decline. The receipts of cars for months of August, September and October of last year were 7,726, against 9,451 for the corresponding months this year. A large part of the increase is of cattle. The demand for the same as dressed beef is becoming larger constantly. A fresh complication has arisen which will call for action by the Knights of Labor. It relates to the slaughtering of cattle for dressed beef depots, and is an outgrowth of the great Chicago strike. Saturday and yesterday 40 car-loads of live cattle were received at West Albany from Chicago, billed to this city, Troy and points in New England. Agents of the dressed beef firms instituted a search, and after some little trouble found that only one butcher would kill stock for them. It is thought that if the strike in Chicago, which has caused the forwarding of cattle on the hoof by these firms, continues, they will have difficulty in finding accomodations in the East for the killing of their stock. The Knights of Labor are bound to support their striking brethren in Chicago and will not kill any cattle for the dealers, and they will also bring their influence to bear to prevent others from slaughtering for them. The live stock dealers will also use their best endeavors to prevent Eastern butchers from accommodating their business adversaries. L.

WHEELER, Steuben Co., Nov. 1.—We have had an unusually good season in this locality. Hardly in years have our crops been more generally good than they have been this year. Hay was an average crop, of the best quality, and put up in good order. Winter wheat was good, but not very heavy-strawed. Barley a fair crop, but not much raised. Buckwheat generally good and giving about 25 bushels to the acre. Oats are splendid, and very heavy. Corn as a rule is a magnificent crop—the best we have for some years. Potatoes were a very large crop, and the quality above the average. Apples are a fair crop, and only bring $1 per barrel in market. Feed has been plentiful and so are stock, and prices have been low. About the same acreage of wheat and rye was sown this Fall as usual, and both are looking splendid. J. W. B.

Virginia.

RICHMOND, Henrico Co., Nov. 8.—The past week this tobacco market showed but slight variation from the preceding week. Common grades depress the market, and as almost every dealer has more or less of these and will be slow getting rid of such stock, it is not expected that an improvement can be reported for a long time. Receipts of new and loose tobacco are almost nothing, and it is well it is so, for new would almost surely bring the farmer in debt. The sovereign remedy for the present low prices is the heroic one of lessening the production, and it would seem as if planters would be forced to acknowledge and heed this advice. Tobacco was high and advancing when the necessaries of life and other products were very low and getting lower. Stimulated by this state of affairs overproduction came a little later, but surely, hence the plethora. Anything in fine shipping, stripping or brights may bring comparatively high values this season, but the great bulk and average crops, it is feared, will bring this section as well as others in debt. The assurance of a very small planting may help prices later in next year's transactions. There may be something in the abolition of the tax. The people favor it on general principles. T. H. M.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

NAVICULAR DISEASE.

J. C. M., New Alexandria, Pa.—A valuable horse becomes lame in his left front leg after

a few days' work, but his lameness disappears when he has rested awhile. I can detect no swelling on the leg or shoulders, and there are no indications of corns; what ails him?

ANS.—Navicular disease is suspected, although we cannot say positively from the incomplete description. Try removal of the shoe and paring of the hoof well, so as to allow pressure on the frog. Cause the animal to stand in a puddle of clay several hours daily, with a poultice on the foot at night. After a week or two, apply a mild blister around the top of the hoof and sides of pasterns, to be repeated as soon as the effect of one blister has passed off. When the soaking of the foot has been discontinued it should be daily anointed with some hoof ointment to prevent excessive drying. Equal parts of tar and vaseline mixed, is excellent for this purpose. A rest of two or three months may be desirable, during which time it may be necessary to blister several times. Feed sparingly on a laxative diet.

CHRONIC BRONCHITIS; SYNOVIAL SWELLINGS.

C. H. W. B., St. Elizabeth of Joliette, Can.—1. My fast three-year-old horse had strangles last Spring, and now after a drive of six to nine miles a mucous, milky liquid is secreted in his nostrils; what is the cause and what should be the treatment? 2. At the pasterns in both front legs there are slight swellings, which are not sore, but are disagreeable to the eye; what are they and how can they be removed?

ANSWERED BY F. L. KILBORN.

1.—Probably a mild form of chronic bronchitis attendant on the strangles. Give a hot bran mash every evening to steam the nostrils. The diet should be restricted and laxative, consisting in part of roots, potatoes, linseed or oil meal, etc. Feed very little bulky food, but more grain if it seems necessary. Clover hay and dusty or musty fodder of any kind must be avoided. Every precaution must be taken to prevent the animal from catching cold or becoming chilled after exercise. The stable should be above ground, warm, dry, clean, airy and free from all disagreeable odors. Twice daily give one dram of sulphate of iron, one-fourth dram of sulphate of copper, one ounce of powdered gentian and one-half ounce of niter. If the feed does not keep the bowels quite easy, add one dram of aloes to the above, and continue as long as necessary. Daily moderate exercise is desirable. If the animal is at all predisposed to broken wind —"heaves"—special care must be taken in the feeding to prevent this very unfavorable result, which is frequently attendant on chronic bronchitis; so much so, in fact, that the disease is called glander heaves by some practitioners. (See article on "heaves" under "Horseman," in this issue). 2. Simple synovial swelling which may have resulted from rapid action or slight bruises. They are merely eye-sores and will not lame the animal. Mild blisters or drawing off the liquid with a hypodermic syringe and applying wet bandages should remove them.

APPLE PARINGS AS A FERTILIZER.

W. S., Mason, Mich.—About an acre of land on a hill is so worn out that nothing will grow on it except sand burrs—soil a light sand and gravel. I can cover it with apple parings from a "drying" house without expense, would it be worth while?

ANS.—A worn-out soil can be restored to fertility only by restoring to it the food of crops that has been taken from it in such quantity as to make it incapable of producing more crops. Such constituents are especially phosphoric acid, potash, lime and nitrogen compounds. This restoration can be effected only by the addition of substantial plant food in stable manure or in commercial fertilizers. Apple parings are poor in such substances as these above mentioned. A ton of them in the fresh condition would contain about two pounds of potash, four-fifths of a pound of phosphoric acid, and one and one-fifth pound of nitrogen. A ton of good stable manure, on the other hand, would contain about 12 pounds of potash, five of phosphoric acid and nine of nitrogen; and all of these plant nutrients would be in a much better condition for ready consumption by the plant than in the apple parings.

GROUND ROCK PHOSPHATE AS A FERTILIZER.

W. L., Hawkesbury, Can.—Mills for grinding phosphate rock are close to this place; it is shipped to the States where it is made into a fertilizer. Would it be advisable to use it on land in its present condition?

ANS.—Nothing can be safely predicted as to the effect of ground rock phosphate as a fertilizer. Many experiments have been tried with it, and with widely different results. These results depend partly on the character of the phosphate itself to begin with, partly on the fineness of the grinding, partly on the season and on the character of the soil and of the crop. South Carolina "floats" has in many instances undoubtedly paid for its application. But the South Carolina phosphate is a better material originally than the Canada phosphate, because it is more readily attacked by the solvent liquids of the soil; and, in the second place, this "floats" is a very fine dust of the rock phosphate, probably much finer than any product of the Canada mills. There is nothing for the inquirer to do but to experiment with the phosphate of his own locality, ground as fine as he can get it, on his own soil and with his own crops; but, so far as we can judge from previous experience with phosphate of that character, the chances of finding profit in it are against him.

INJURED THIGH IN A HORSE.

G. A., Campville, Conn.—Two weeks ago my five-year-old mare was kicked, or in some other way bruised on the inside of the thigh between the hock and stifle joint. The leg is now swolen to the hoof, but there is no running sore; what should be done?

ANS.—Place the animal in slings with the feet just touching the floor, so that the horse can settle into the sling when weary. This will prevent irritation of the injured limb by lying down and rising. Apply a loose bandage and keep constantly wet with cold water. Remove the bandages frequently and rub with the hands for several minutes at a time, continuing the cold water. The diet should be laxative—roots, apples, linseed meal, etc. in part, and restricted in quantity. If at any time there is any evidence of suppuration, the cold water must be replaced by warm poultices. If relief is not obtained in a few days, consult a veterinarian to treat complications.

ABOUT PUGET SOUND AND THE WILLAMETTE VALLEY.

A. W. McK., Norwood, N. Y.—What sort of a climate have they in Puget Sound and the Willamette Valley? Would either be a good country for people with weak lungs? Is there malaria, and what sort of water have they?

ANSWERED BY MARY WAGER-FISHER.

The climate of the Puget Sound Basin is delightful for nine months of the year with much rain and a heavy atmosphere in the Winter with an intermixture of superb days. While it is never cold enough to freeze very hard, it is very chilly from the humidity of the air, which, however, is "salt." There is no malaria in the form of ague or "chills and fever." The climate is not considered very salubrious for lung diseases; in some cases it acts curatively, in others disastrously. Upon the whole, local physicians speak of it favorably rather than otherwise for pulmonary weakness, but it is not so good, by far, as some parts of Southern California that are protected from the coast winds. The Willamette Valley is hotter in the Summer than the Sound, and "wetter and soggier" in the Winter, and there is malaria at different points. Water excellent in Puget Sound and good in the Willamette Valley.

Miscellaneous.

W. H. H., Sadlersville, Tenn.—1. I have sown 20 acres of wheat on corn land. I intended to have drilled in some bone dust with the seed, but the Fall was so dry I was afraid to do so; would it pay to sow about 100 pounds of bone dust, broadcast, on the snow in February? 2. What are the three best varieties of grapes for eating purposes? The ground is very poor, can I dig holes and fill them with rotten manure for the vines?

ANS.—1. Yes it would be the best way in which you could now use the fertilizer. We should add potash in some form—wood ashes preferably. The quantity mentioned is a small amount per acre. Better sow 200 pounds, or more. 2. It is hard to choose. We mention the following: Brighton, Jefferson, Moore's Early, Hayes (F.B.), Victoria, Empire State. You may plant now or wait until Spring. For your climate there will be little advantage either way. Dig holes or trenches as large as you choose—the larger, the better—18 inches deep. Fill in with the rotted manure and mix it with soil. Spread out the roots carefully and cover them firmly with *soil*.

Subscriber, Beeders' Hills, Ia.—Last Spring my horse was cut on a wire fence between the fetlock and the hoof; the sore healed, and I worked him about a month when he began to get lame again. I gave him rest, and in two days he appeared all right, and I worked him again, but again he became lame. He hasn't been worked since. His leg from the hock nearly to the knee swells slightly and feels feverish after a very little exertion. What should be done for him?

ANS.—Judging from your brief description, the lameness may or may not be due to the injury, and without knowing more definitely we cannot well prescribe. Perhaps important structures were injured, and their functions have not yet been restored, but will be in time. Better consult a veterinarian, if possible. Otherwise allow a few months' rest, with daily walking exercise, thorough grooming, and light diet.

B., Tom's River, N. J.—Do the late bearing canes of the Earhart Raspberry, live over the Winter to bear the next season? If not, being the latest Summer growth, how is the crop produced the following season?

ANS.—The late bearing canes of Earhart do not live over Winter. The main crop in June or July of each year is produced on canes of the previous season's growth that did not fruit the Fall previous, there being such in each hill. Two or more canes in each hill produce the crop out of season, the rest living over and giving the main crop next year, soon after which the earliest of the new growth of cane begin to produce fruit and continue till stopped by freezing in the Fall.

R. A. S., Greenville, Ky.—Is it possible to cure a horse that has had the heaves for four or five months?

ANS.—See article on this subject under Horseman in this issue.

DISCUSSION.

BLOODY MILK.

H. S., HIGHLAND, N. C.—The Farmers' Gazette's remedy for bloody milk in the RURAL of Oct. 30, is based upon the fundamental principle that improper feeding and nutrition are the cause of nearly every ailment that animals are subject to. Ground white beans and bran are highly nitrogeneous, while the too common feed of our animals is too carbonaceous. The excess of carbon must be burned out. This term is strictly exact, for the carbon disposed of in the animal system is actually consumed by heat; hence the blood is disordered and many febrile diseases are developed in consequence. The presence of blood in the milk indicates plethora and a too active circulation, and a change from carbonaceous to nitrogenous food—in moderation, however—restores the balance of the system. Mr. Wood's instance of the ruin of a matchless Short-horn cow Lady Ann has two sides to it. Had she never been forced to show what she was capable of, no one would ever have known of her surpassing excellence. Her example reflected on the whole race of Short-horns, however; just as the similar sacrifice of many noted Jersey cows has given character to the Jersey breed. It is hard upon the poor beasts, but it is natural. How many men sacrifice themselves to show what humanity is capable of!

S. H., HACKENSACK, N. J.—Several articles in late issues of the RURAL speak for and against the spontaneous origin of contagious pleuro-pneumonia. To me it seems curious that veterinarians should deny what physicians admit and conform their practice to, viz., proving the spontaneous origin of contagious diseases and the efficacy of sanitary precautions in preventing them. The explanation seems to me to be that there is a prevalent idolatrous worship of the evolution doctrine of which the germ is the grand fundamental principle; and this leads to the belief that there must be a germ from which everything grows. This theory, however, does not necessarily apply to the diseases of animals any more than it does to fire. Fire spreads by contact, but it has an origin in chemical action; and why do not some diseases occur through chemical action as well?

Catarrh Cured

Catarrh is a very prevalent disease, with distressing and offensive symptoms. Hood's Sarsaparilla gives ready relief and speedy cure, as it purifies the blood and tones up the whole system.

"I suffered with catarrh 15 years. I took Hood's Sarsaparilla and now I am not troubled any with catarrh, and my general health is much better." I. W. LILLIS, Chicago, Ill.

"I suffered with catarrh six or eight years; tried many wonderful cures, inhalers, etc., spending nearly one hundred dollars without benefit. I tried Hood's Sarsaparilla and was greatly improved." M. A. ABBEY, Worcester, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

CATARRH SAMPLE TREATMENT **FREE**

So great is our faith we can cure you, dear sufferer, we will mail enough to convince, free. B. S. LAUDENBACH & Co., Newark, N. J.

10 PER CENT. INVESTMENT.

THE MASS. REAL ESTATE CO.

Has earned 10¼ per cent. net upon its capital invested to the present time, and now owns about half a million dollars worth of first-class business real estate. It is under the management of such men as Lieut. Gov. Ames, Mayor Green of Fall River. Send to offices of Co. for prospectus, to GEO. LEONARD, Agent, 246 Washington Street, Boston, Mass.

100 Choice New Recitations 13 Songs, Elegant Sample Cards, all for a 2c. stamp. CADIZ CARD CO., CADIZ, O.

WE WANT YOU! a live energetic man or woman needing profitable employment to represent us in every county. Salary $75 per month and expenses, or a large commission on sales if preferred. Goods staple. Every one buys. Outfit and particulars Free. STANDARD SILVERWARE CO., BOSTON, MASS.

NEW Sample Book of beautiful cards, 14 Games, 12 tricks in magic, 136 Album verses. All for a 2c. stamp. STAR CARD CO., Station 15, Ohio.

"SINGER" MODEL SEWING MACHINES for $12.00 up. Warranted 5 years. New and perfect. Sent on trial if desired. Organs given as premiums. Send for circular with 7,000 testimonials from every state. We can save you $15 to $50. GEO. PAYNE & CO., 42 W. Monroe St., Chicago.

DEAFNESS Its causes, and a new and successful CURE at your own home, by one who was deaf twenty-eight years. Treated by most of the noted specialists without benefit. *Cured himself* in three months, and since then hundreds of others. Full particulars sent on application. T. S. PAGE, No. 41 West 31st St., New York City.

500 Speeches, Selections, etc., and agents new Sample Cards for a 2c. stamp. GIVIN & BRO., Cadiz, Ohio

FRINK'S RUPTURE REMEDY

Will quickly cure any case of Hernia or Rupture. Explanation and testimonials free. Address O. FRINK, 24 BROADWAY, NEW YORK.

The DICK Seamless Foot Warmers

The Popular **Fireside Comfort SHOES.** Now worn everywhere. Woven by Hand & Lined with Wool. The only shoe combining Warmth, Pliability and Durability. If your dealers have none order a sample pair of us. Ladies' sizes **$1.35**; Men's **$1.60.** Mailed to your address postage paid. Write plainly and give size of shoe. W. H. DICK, Manf'r, Dansville, N.Y.

THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, NOVEMBER 20, 1886.

In reply to our note a few weeks ago which quoted a paragraph in Mr. Lovett's catalogue, which expressed some fear that the Earhart Everbearing Raspberry is the same as the old Ohio Everbearing, we are told by those who have both kinds growing that they are quite distinct and that the foliage of the Earhart is quite unlike that of any other blackcap raspberry known.

It will be remembered that we succeeded in crossing the blackberry upon the raspberry and, *vice versa*, the raspberry upon the blackberry. Quite a number of the hybrid seeds were obtained and planted at once. Without experience in raising raspberry-blackberry seedlings, we had supposed that, like fresh grape seeds, they would sprout in a month or so. They have not sprouted yet, and the boxes containing the seeds have been buried so to remain until next Spring.

Suppose you buy a chemical fertilizer which costs you $44 per ton and is worth by analysis $40 per ton, the difference being four dollars. Suppose your neighbor buys a ton of commercial fertilizer that costs him $24 per ton which is worth by analysis $20, the difference also being four dollars. Suppose the latter farmer goes to the other and says: "I want to try an experiment. Give me 200 pounds of your fertilizer and I will give you 400 pounds of mine." How much would the first farmer lose by the exchange?

Under date of November 3, Secretary George W. Campbell, of Delaware, Ohio, writes: "I am now pruning my vines preparatory to laying them down for Winter, and this is what *you* ought to do, and not only practice but preach it to all who want to grow the best grapes successfully." If there is any man in this country better qualified to give instructions as to out-door grape culture than Mr. Campbell, we don't know who he is. The reason why we have never protected our vines is that we have desired to subject them to the severest tests possible, so that those influenced by our reports could never be misled.

A lad a dozen years old could readily be taught to start and stop a locomotive, without comprehending the first principle of its operation, but who would care to risk his life with such an engineer in a journey on one of our fast railway trains? The narrow-minded farmer who is most strongly prejudiced against scientific farming would not dare to ride behind an engineer whom he knows is not well acquainted with the principles of the machine he is trying to operate. If a man is unfit to be an engineer who does not understand the science of the steam engine, why may not a man be a better farmer by understanding what is known of the science that underlies his calling.

In reply to many inquiries it may be said that the new potato, to be called the "Rural New-Yorker, No. 2," is the first of our many seedling potatoes that we have cared to introduce. Any inferior novelty is sure to injure the originator sooner or later. We do not suppose that we shall be able to distribute this potato among our subscribers before the Fall of 1888. In other lands and climates it may not prove an acquisition. As raised at the Rural Grounds it possesses more points of unusual merit than any of the 600 kinds there tested during the past 12 years. It *seems* to be about perfect in every way. We know nothing of its parentage, never having kept any record. No attempt has ever been made at the Rural Grounds to cross-breed potatoes since seed-balls rarely form, and it is like hunting for a needle in a hay stack to find pollen.

Miss Alice Brown, the daughter of the good Waldo F. Brown, so well known to the reading farmers of America, begins with this number of the R. N.-Y., in Miss Taplin's Department of "Women's Work," the first of a series of papers which she calls "Some Ways and Things at the Rural Grounds." The design of these papers is to tell her readers without any reserve whatever, all that she deems worth the telling, of what, in her daily life, she sees, thinks and does. Miss Brown was, for a time, employed in the Rural Office, a position she resigned over a year ago to become a member of the Rural family, where she has made the education of the children her first duty. These papers, as will be seen, are perfectly sincere and frank: real names are used and neither fear of giving offense, nor a desire to please those of whom she speaks will be permitted to influence her writings in any way. Miss Brown is one who, if she can not speak the truth, will do the next best thing—hold her tongue.

The following articles will appear as soon as space permits:

Recuperative Agriculture. In two parts, by Prof. I. P. Roberts, of Cornell University.

Bee Notes, by Prof. A. J. Cook, Michigan.

Transcontinental Letters (continued), by Mary Wager-Fisher.

Notes from the Rural Grounds. Fertilizer tests on a poor soil. Self-Husking Corn, Brazilian Flour Corn, etc.

Floral Notes, by William Falconer, N. Y.

Horticultural Topics, by many writers.

There is a whole sermon on our first page. The text is plain. The farm animals, like faithful servants, have chosen Thanksgiving Day as a fitting time to show their respect for their master and his family. They have done their best through the year to make a good return for the kind treatment they have received. The old turkey makes a fine spokesman. How promptly he reads his "resolutions;" how honest are the good wishes of the faithful "committee" behind him; how sincere is the pleasure of the farmer upon being "called out" at such a time. They have all worked well together now, and when they come to figure up the good things of life they find themselves ahead. It is a good thing to have the respect of one's animals. It is a matter of profit and it makes a better man out of the farmer to encourage kindness and respect in his stock. Every department of the farm will reflect the character of the farmer. Impossible is a true Thanksgiving on the farm where animals shrink away in dread at the coming of their master. Let us be merry this year. "Care will kill a cat," and we want none of it now. Let us heartily take these words out of the old turkey's mouth:

"Thought magnifies our troubles,
Care eats the heart away,
Think only of your blessings,
And give your joys full play."

A DUTY OF THE AGRICULTURAL DEPARTMENT.

That lengthy advertisement concerning the alleged existence of vast fortunes awaiting unknown claimants in England, Holland, and Germany, is still appearing in some of the best weekly or agricultural issues of the great dailies, and has lately also found a place in a few agricultural papers. The falsity of the assurances contained in the advertisement has been proved more than once by the investigations of our Ministers in London, Berlin, and the Hague, published through the State Department at Washington. We very distinctly remember clipping such official disclosures from the Washington correspondence of some of the papers which now give admission to this deceptive advertisement. The English Court of Chancery and the Bank of England, the alleged depositories of these nebulous fortunes, have both officially declared that they hold no such trusts. By the statute of limitation in England any attempt to recover real estate from the Crown or individuals after the lapse of 12 years, or personal property after the lapse of 20 years, is certain to meet with failure, however valid the claim may have been originally; yet the great majority of these supposititious fortunes are supposed to have been lying unclaimed in England for periods of from 50 to 150 years! In the Rural of October 16 the mythical nature of these fortunes was fully exposed. At our suggestion, the Department of Agriculture, about a year ago, started to expose frauds upon farmers in its monthly reports; but dropped the task after one or two issues. The advertisement of these bogus estates is addressed almost exclusively to bucolic gullibility; should not the Department of Agriculture officially warn its friends of the true nature of the humbug? The records of the Department of State, readily accessible, will prove the truth of our statements, and the official character of the Department's report will leave no excuse to the publishers of papers for inserting an advertisement designed to bamboozle their patrons.

TO EVERY READER.

There is a thing or so respecting the R. N.-Y.'s Seed Distribution that we would gladly impress upon our readers. First, the object of these distributions is *not* to send out seeds in *quantity*, but merely in *trial* lots so that our subscribers without expense, may test them. Second, we do not sell our seeds or offer them as *premiums*, and never have done so in any case. *Every* subscriber who *applies* is entitled to them. If subscribers wish to *purchase* the seeds they must deal with seedsmen. We have always laid great stress upon the fact that we do not sell seeds, plants, or anything whatever except the Rural itself. We want our readers to believe, indeed to *know* that our advice in these pages is unbiased by any interest in seed or plant raising as a business. We hold that the proprietors of a journal that is worthy of the full confidence of its patrons have no right to use it for advertising their own wares, or, in other words, that journalism and mercantile pursuits should never be combined. The only legitimate exception is that of the so-called *trade* journal, which, in point of fact, is merely a catalogue or an advertisement of certain goods offered for sale, rendered more or less interesting and instructive by the reading matter it contains.

The R. N.-Y. has certainly introduced some of the most valuable varieties now in cultivation, some of which have originated in its experiment grounds, while others have been sent out before they were known to our seedsmen. In this way they have been tested all over the country and their value has been positively ascertained without cost, except to the Rural—while the seedsmen have reaped the profit of all sales consequent upon the demand which the popularity of the seeds so distributed has created.

Our readers will certainly excuse us for feeling annoyed when at a very heavy cost and with the best of motives, the object of our laborious Seed Distributions has been misrepresented. We dare to make the statement that no other journal has so profited the seedsmen and nurserymen of the country as has the Rural New-Yorker, through its tests of plants and seeds, and through its free distributions of the best varieties it is enabled to secure for that purpose.

SALES OF OLEOMARGARINE.

The reports of the Commissioner of Internal Revenue at Washington say that the oleomargarine tax promises to yield an annual revenue of $1,000,000 to $1,500,000, whereas a short time back the prospective revenue from it was not expected to be over $600,000. The haste with which this prognostication is made public indicates a wish on the part of the officials to give the new commodity a place among the legitimate industries of the country. They reason that the dairy interests made a mistake in the notion that to levy a tax on bogus butter would lessen the consumption of it. Its inspection and sale under government supervision, they say, guarantee to the public its purity and healthfulness, and hence when the difference in price is made clear, good oleo will certainly be preferred to bad butter. Already the Boston papers are publishing market reports giving the comparative prices of oleomargarine and butter, quoting good butter at 24 to 25 cents per pound, while the best oleo can be had fo 17 cents. It seems to us probable that the notion of the prospective increase in the manufacture and sale of this concoction, as indicated by the amount of taxes paid, is due to a mistake with regard to the quantity made before the enforcement of the law. Most of it was then sold for genuine butter, and no correct statistics existed as to the amount annually turned out, as it was to the interests of manufacturers and dealers to belittle the quantity. Owing to a deficiency of competent officials the Government inspection is at present merely nominal, nor is it likely at any time to be thorough and ubiquitous; government inspection therefore cannot possibly guarantee the purity and wholesomeness of oleo.

The local authorities in most of the States in which oleo laws exist, appear to have been much more active than formerly since the National legislation went into force on November 1, and in such States the State and National authorities ought to have little difficulty in enforcing all the provisions of State and National legislation. There is considerable complaint that Congress did not make sufficient appropriations to enable the National Government to properly supervise the enforcement of the law; but this and other mistakes should be rectified early in the approaching session of that body.

BREVITIES.

Thanksgiving Number of the Rural New Yorker—24 pages.

Wind up your clock before it has run down.

The next Special of the R. N.-Y. will be the New Year Number—the first of 1887.

The Departments of Woman's Work and Domestic Economy are unusually interesting this week.

The continuation of our report of the North American Bee Keepers' Society is necessarily deferred another week.

"The home of the farmer who boards his own help can never be a model farm house." See Prof. Shelton's article, page 766.

Yes, we would advise our friends to plant a Kelsey's Japan Plum, a Simon's Plum, and a few Earhart Everbearing blackcaps.

We are satisfied of one thing, viz., that potatoes will "straggle," if inclined to do so at all, more when raised under level culture than when hilled up.

At the request of several readers we have delayed the awarding of prizes for the corn, melons and peas. We shall make our awards December 1.

We commend Prof. Budd's article on page 769 to the consideration of every progressive pomologist. It may seem unseasonable; but now is the time to think over and plan for next Spring's work.

We hope that most of our readers will feel like celebrating Thanksgiving day heartily—and we extend our sympathy to those who are likely to pass it in sorrow or in pain. God help those who suffer, whether their suffering be of the mind or body.

Marshall P. Wilder sends us bunches of a new white grape, the "Minnehaha," the result of a cross of Muscat of Alexandria on Rogers's Massasoit. He also sends us two cuttings of this vine which we hope to be successful in rooting, since we know of no better hardy grape. He also sends us a shoot of the rose Marshall P. Wilder, six feet long. This gives promise that this fine hardy rose may become a pillar rose. If so, it would be magnificent, indeed.

The use of portable and traction engines is becoming more general in all sections where farming is done on a large scale. The roads and bridges must be made to accommodate them. In a Pennsylvania town a traction engine fell through a bridge and the town was obliged to pay all damages. The cost of the bridge and the damage to the engine amounted to enough to build a bridge capable of holding up a locomotive.

This is the first compliment we have ever known the experienced and well-known farmer and farm writer, Henry Stewart, to pay an agricultural paper:

"I think the last Rural the most interesting and valuable paper I have ever met with. There are some good things which pay for being chewed and digested over again, and I have noted some of these. But this paper is filled with them, and might be usefully folded and put away for a weekly re-reading. I think the Rural has taken the lead—easily—of the agricultural journals."

The New York Court of Appeals has just decided a case involving the construction of the new State oleomargarine law of 1885. One Arensberg was convicted in Brooklyn of having violated the law. In charging the jury the trial judge submitted to them the bare question whether the defendant had manufactured or sold oleomargarine not made from milk or cream, and charged that if he did he was guilty under the law. The Court of Appeals has reversed the judgment, holding that the guilt of the defendant did not, and could not be in the simple manufacture and sale of the article; but depended on the further inquiry whether it was manufactured in imitation or semblance of butter; and whether by the use of ingredients not essential in the article itself it was sought to accomplish such imitation or resemblance. It was thought that the constitutionality of the law would be raised by the case; but the question was not considered. After a time we shall know how to formulate an oleomargarine law that will not only stand judicial decision, but will also prove effective in accomplishing the legitimate aspirations of the dairy community.

THE RURAL NEW-YORKER FREE PLANT AND SEED DISTRIBUTION FOR 1887.

THIRTEENTH REGULAR SEED DISTRIBUTION

OF THE

RURAL NEW-YORKER.

The collection will be sent to every subscriber who applies, without any charge or conditions whatever. The application, "Send Seeds," is all that is required.

Let it be understood that the object of these distributions of Seeds or Plants is (1) to introduce new varieties of merit, and (2) to enable readers to test them in a small way without expense. If larger quantities be desired, our readers must purchase the seeds of those who sell them, or wait until they are offered for sale. The proprietor of the R. N.-Y. wishes it to be known by all the patrons of the paper that we never sell seeds, plants, or anything whatever, except subscriptions to the R. N.-Y. itself.

THE POND CORN.

AS EARLY AS ANY FIELD CORN IN CULTIVATION.

It glazed at the Rural Grounds in 85 days. Plants six feet high, ears born low. Red, yellow, and variegated grain from one seed. From eight to twelve rows. Large kernels, small cobs. Never offered for sale.

Extra Early Orange Squash.

Much earlier than the Boston Marrow, and equally valuable as a Summer or winter squash. Very prolific.

Northern Pedigree Sweet Corn.

The earliest and best sweet corn known. Selections of seed made for 25 years. The dwarfest plants. Ears perfect in form and of exquisite quality. A first-rate acquisition.

Cleveland's Improved Valentine Bean.

"The Earliest String Bean grown—two week's earlier than the Round-pod Valentine and much more prolific. Unequaled in uniformity of ripening. Nearly the whole crop can be taken at one picking.

The Rural's Garden Treasures.

These flower and shrub seeds are collected at the Rural Grounds and bought of seedsmen. There will be at least 150 different varieties. All are thoroughly mixed before being put up in the packets sent to subscribers.

The Pond Corn.

THIS was not planted at the Rural Grounds until the 5th of June. The grain began to glaze August 25th, and was ready to harvest in 85 days. It is a remarkable variety of flint corn in several respects. Some of the ears bear only yellow kernels, some variegated, some red, and all may sometimes be found on a single plant. The kernels average as large as any flint corn we have tried; the cobs are as small as it is desirable they should be. The rows vary from eight to 12. The plants are of medium hight, or about six feet. They sucker very little. The ears are borne low. It is our belief that this corn will ripen anywhere that any field corn will mature. It originated with Mr. Emmons Pond, of Jewett Heights, Green Co., N. Y., who writes as follows in regard to it: "I have seen red, white, yellow and streaked on one ear, but usually the red ears are distinct. I have also seen red and yellow ears on the same stalk; also eight, 10 and 12 rows on one stalk. I think a yellow ear would produce all colors. I think it will ripen with you in 90 days. It is colder here and takes a little longer. The ears grow low on the stalk, about one foot from the ground. With ordinary cultivation it grows six feet high, but I have seen it 10 feet high. The best ears are 12 to 13 inches long. Many ears are 12 rowed with a *wonderfully* small cob, as you may know from the size of the kernel. I never saw a corn that can run so large a stream from the sheller. The cobs are not much larger than a man's finger. The corn from which this has been bred was given to my uncle. I at once commenced crossing it with kinds having long ears, always saving the ears showing the best characteristics of the parents on both sides, and I now think it will produce more shelled corn to the acre than any I ever saw raised in the North. I never thought of distributing it until you sent me the Angel of Midnight Corn, which is inferior in the size of the kernel, ripening much later and having a larger cob. I am no seedsman, though I take great pleasure in experimental farming. I did not send the corn to you with any idea of making money out of it, but merely with a view of benefiting your readers, should you think well to introduce it. Had the season proved favorable, I think I could have shown you ears equal to the Western dent corn with the advantage of early ripening."

At Fig. 425 is shown an ear of this corn sent us by Mr. Pond. This drawing is the exact size of the original ear. The kernels are variegated, being dark red streaked with yellow. At Fig. 426 is shown a section of an ear grown at the Rural Grounds. Here the kernel is a solid red. At Fig. 427 is shown a cross section of Fig. 426 reduced.

NORTHERN PEDIGREE SWEET CORN.

WE raised a small plot of this new variety the past season in the same field with 20 other kinds. It was the earliest of all and as sweet and tender as any of the later kinds. The ears are small, though the kernels are large and set closely together in straight rows. In the poor soil of our experiment field the plants were scarcely more than knee high. The originator writes as follows:

"I can give no history of the Northern Pedigree Sweet Corn, except that for many years it has been a favorite early variety in my family. I do not know where it first came from, as the time is beyond my remembrance. For at least 25 years the earliest and best formed ears have been saved for stock. This has resulted in securing the sweetest and most perfectly formed ears of any early sugar corn known. I have tested it side by side at different times with all the early varieties I could hear of, and with the single exception of the Cory it has always proved to be from six to 10 days earlier than the earliest. This season it was fit for the table but two or three days before the Cory. But in *all* those qualities that go to make up a first-class sweet corn it was more than "head and shoulders" above the Cory. All who tested their comparative merits decided that the Northern Pedigree was the sweetest, richest, most tender, earliest, and had by far the most compact and best formed ears. The Northern Pedigree is more even and uniform in size and shape, being but a trifle larger at the butt end than at the tip. The Cory, like its twin brother the Marblehead, has a large, heavy-butted cob on which the kernels are loosely and awkwardly placed. The growth of stalk is dwarfish, allowing *close planting*. Nearly every stalk gives two of these handsomely formed ears."

We have only to add that the seed corn of our experiment plot was given to us by J. M. Thorburn & Co., of New York, and that it is through that firm that we have been enabled to purchase seed enough for this distribution. (See Fig. 428, exact size.)

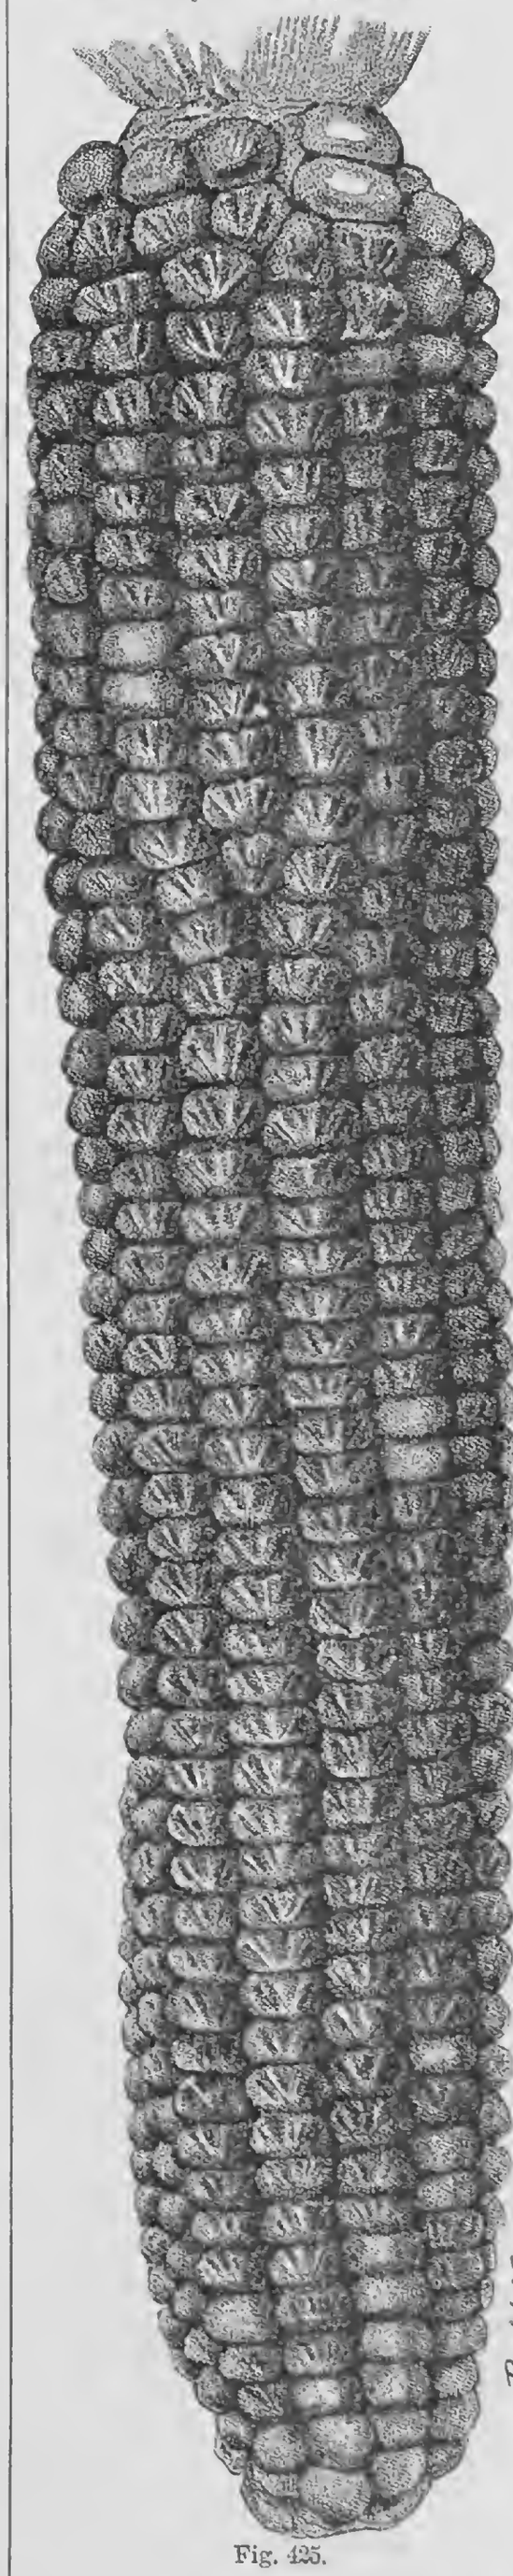

Fig. 425.

CLEVELAND'S IMPROVED VALENTINE BEAN.

THIS originated with A. B. Cleveland & Co., of Cape Vincent, N. Y., who writes us: "In reply to your favor we would say that we believe this bean to be the earliest string bean grown. Its habits are similar to the regular Round Pod Valentine, but it is two weeks earlier and much more prolific. The pods are unusually thick and fleshy and of the finest quality, and unequaled in uniformity of ripening. Nearly the whole crop can be taken at one picking."

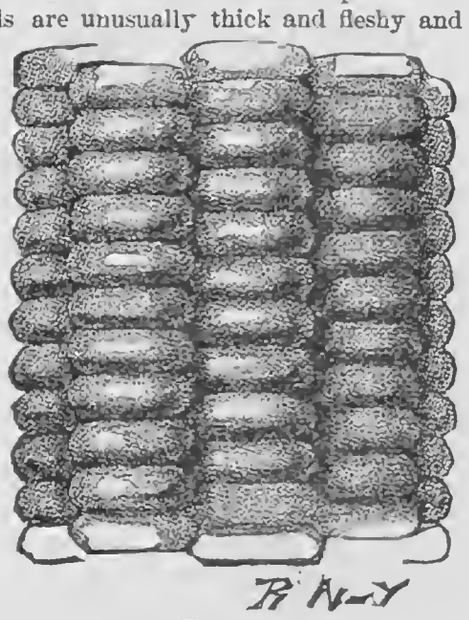

Fig. 426.

THE RURAL'S GARDEN TREASURES.

WE call these "Garden Treasures" for want of a more appropriate name. Let it be understood that the *bulk* of these flower seeds is made up merely of the good old popular varieties, which all seedsmen offer. To these are added small quantities of such choicer varieties as we are enabled to gather at the Rural Grounds and elsewhere through friends and subscribers. It would well pay our readers for their pains if they would spread out the seeds of the envelope sent them on a smooth piece of paper and separate into as many little lots those which seem to be the same. In this way each might be sown separately, if so desired, and the shrub or tree seeds be given the different care they require. The

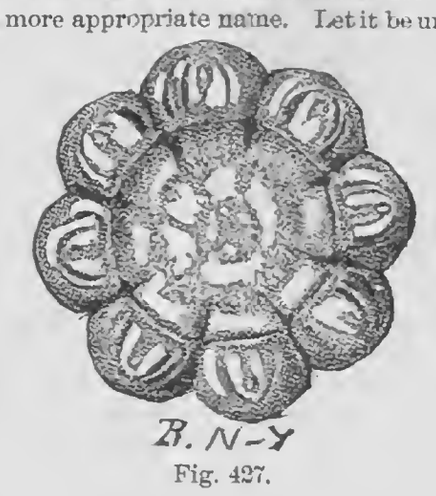

Fig. 427.

Fig. 428.

seeds of which the largest quantities have been obtained are as follows: Vitus heterophylla variegata (Ampelopsis), Eulalia Japonica Zebrina, Pinks in variety, Clematis (requiring a long time to germinate). Canna in variety, Asters in variety, Perennial Phlox, Spiræas, Yellow-wood, Coluteas, Geranium sanguineum, Marsh Mallow, Yuccas, Viburnum Lantanoides, Verbenas in variety, Sweet Williams in variety, Magnolias, Sweet Peas in variety, Virginia Stock, Zinnia, Portulaca, Poppies, Phlox Drummondii, all in variety; Petunias, Pansies, Nigella, Nemophila, Dwarf Nasturtiums, Marvel of Peru, Mignonette, mixed Lupins, Godetias, Gaillardia picta Lorenziana, Eschscholtzia, Chinese Pinks, Heddewigii, etc., Convolvulus, major and minor mixed; Candytuft mixed, Calliopsis mixed, Calendula, Balsams double mixed, Amaranthus, Sweet Alyssum, Agrostemma, Ageratum, Adonis, etc., etc., etc.

We have seen a number of gardens filled with plants from last year's Garden Treasures and they were very pretty, interesting and instructive to those who care to learn the names of such flowers. We hope our lady friends, for whom they are chiefly intended, will give these seeds good care and the young plants ample space.

EXTRA EARLY ORANGE SQUASH.

As its name indicates, this new squash is of a beautiful, deep, orange color, and the earliest of all squashes, excepting the summer varieties. In form it is a little more elongated than the Boston Marrow, to which it seems to be distinctly related, as the rim, leaf and manner of growth are nearly the same. But in the fruit of the vine the resemblance ceases. The Early Orange is very much more prolific; is of a deeper, richer color both inside and out; is finer grained, richer flavored, and a much better keeper. But its main distinctive feature, and the one which will give it the greatest and most widespread popularity, is its extreme earliness. It is at least 10 days earlier than any other long keeping variety and will keep as late as the latest.

PLEASE NOTE THIS.

THE RURAL NEW-YORKER has never in any case SOLD SEEDS OR PLANTS to subscribers. This being well known, our reports of the results of our tests are fully accepted as trustworthy, and the true value of hundreds of new and high-priced seeds and plants is made known. When, by such tests, we find that a given plant is more valuable than others of its kind which have been generally cultivated, we, at once, if practicable, place it in our next Distribution, and send it without charge to all of our subscribers who APPLY. These distributions are not premiums and are

ABSOLUTELY FREE,

and their primary object has always been, and is, to promote the interests of agriculture and horticulture.

AND, FURTHER,

in order to protect ourselves from imposition, we shall send the seeds to such applicants ONLY as are regular subscribers and whose names are therefore upon our lists.

☞ IT WILL SAVE ☜

us trouble, and it will save our subscribers trouble and expense if they will make their applications for the seeds and plants in the same letter in which they renew their subscriptions. It is only necessary to say ☞ "Send seeds." But the application ☜ must be made upon a *separate slip* ☞ *giving the full name and address of the applicant* ☜

WE SHALL BEGIN

to distribute the seeds about the end of January—or sooner if possible. The request is made that none will apply for the seeds unless they are willing to give them a careful trial.

Previous Free Seed Distributions Of the Rural New-Yorker.

We give below a list of the leading seeds and plants which have been sent to our subscribers through the RURAL'S Free Seed Distributions since they were begun in 1877. This list also shows how many of these seeds and plants have been popularized.

1877—Pelargonium (seeds mixed), Moluccella lævis (Shell-Flower), Dioscorea batatas (Chinese Yam), Ricinus Gibsonii (Purple Castor-oil Plant), Cleome spinosa.

1878—Pearl Millet, Beauty of Hebron Potato, Voorhis Watermelon, Golden Rural Tomato, Acme Tomato, Bronze Ricinus, Hibiscus Moscheutos, Callicarpa Americana, Chater's Lemon Hollyhock, Weigelas in variety (seeds), Deutzia crenata fl. pl., Hibiscus militaris, Eringium Lævenworthii, Geranium sanguineum, Yucca filamentosa, Vitis heterophylla, Rural Hybrid Aquilegias, Defiance Wheat, Grindelia spuarrosa.

1879—Cuthbert Raspberry Plants, Chester Co. Mammoth Corn, Telephone Pea, Mold's Ennobled Oats, Bebb's Aquilegia (seed), Magnolia seeds (in variety), Abies Sibirica, Pentstemons, Ipomœa leptophylla, Iris lævigata, Aristolochia Sipho, Mangel New Golden.

1880—Blount's White Prolific Corn, Champlain Wheat, Clawson Wheat, Salix pentandra (cuttings), Pentstemon Hybrids, Rural Hybrid Ricinus, White Elephant Potato, Rural Branching Sorghum, Argenteuil Asparagus, Giant Dutch Purple Asparagus, choicest strains of Chinese Pinks, Carnations and Picotees, including "Eastern Queen', and "Crimson Belle."

1881—Rural Dent Corn, Rural Thoroughbred Flint Corn, Wysor's Fultzo-Clawson Wheat, Surprise Wheat, Shumaker Wheat, Challenger Lima Beans, Perfection Golden Heartwell Celery, Perfect Gem Squash, Rural Chater Hollyhock (mixed.)

1882—Catalpa speciosa, Black-bearded Centennial Wheat, Niagara Grape (seeds), Rural Blush Potato, Garden Treasures (in great variety), Perfection Watermelon.

1883—Wysor's Early Shoe-peg Corn, Rural Union Corn, Cleveland's Rural N. Y. Pea, cross-bred Diehl-Mediterranean Wheat, Thousand-Fold Rye, Horsford's Market Garden Pea, Black Champion Oats, Best varieties of tomatoes mixed.

1884—Corn, 50 different varieties, crossed at the Rural Grounds, Carter's Stratagem Pea, Sorghum halapense, Rural Bicolor Tomato, King Humbert Tomato, Prince of Wales Pea, Green Flageolet Bean, Garden Treasures.

1885—Bird Cantaloupe, Alaska Pea, Best Watermelons, Angel of Midnight Field Corn, Hackensack Melons, Garden Treasures.

The Seed Distribution is not to be considered in any sense as a premium. Its prime object is to promote the interests of agriculture or horticulture. Our aim is to carefully test the varieties before they are sent out. We desire to place in the hands of our subscribers seeds of promising novelties, so that they may be tested at a small cost, saved if good, rejected if inferior. As to the value of the distribution, we can only point to the fact that many of the most valuable plants in cultivation have been given to the public in this way. No seedsman would care to send to us for distribution a new plant that did not possess superior merits. Anything like a unanimous condemnation on the part of the readers of the RURAL would kill any plant forever.

OF INTEREST TO ALL.

We may be pardoned for speaking about ourselves. Our own opinion concerning the merits of the RURAL NEW-YORKER may be different from that of others, but it at least represents what we attempt to carry out in the management of the paper. The best way to judge of any paper, as we have always claimed, is to examine it carefully, in comparison with others. We only ask our friends to send for specimen copies so that they can carefully and critically examine them. If the paper is not then considered worth its price, we have nothing more to say.

Those who are familiar with this journal will, as we believe, support us in the following claims: 1. The RURAL NEW-YORKER is filled with original reading matter from beginning to end by the best writers of America and England. 2. It is printed upon fine, natural-colored paper. 3. It contains yearly not less than 500 engravings, mostly original, by our own artists. 4. It is conducted by practical farmers, whose first aim it is, irrespective of advertisers and all merely pecuniary or personal interests, to tell the whole truth. 5. The RURAL is the first newspaper to have established Experimental Grounds in connection with journalism. All new farm and garden implements, seeds and plants are there tested and the results are impartially reported upon in its columns. 6. The RURAL NEW-YORKER is conscientious, progressive, aggressive, sparkling and original. It admits no ambiguous or fraudulent advertisements. It is pure in tone. It contains 16 pages weekly and four-page supplements are issued whenever advertising would otherwise trench upon its reading matter. 8. The value of its

FREE SEED DISTRIBUTIONS

is now well and widely known. Only seeds or plants which have originated at the RURAL'S Experiment Grounds, or which are new or the best of their kinds, are distributed. 9. We have introduced or disseminated during the past eight years not less than 100 different species or varieties among our subscribers without cost to them. 10. Truth, progress; the real interests of the land and those who cultivate it, the dissemination of improved seeds and plants and of the knowledge how best to cultivate them; and finally so to conduct the journal that it may have a just claim upon all who love nature, are among the aims of the RURAL NEW-YORKER.

Among its most important departments are cattle, horses, sheep, poultry, swine, arboriculture, dairy, domestic economy, farm economy, field crops, garden crops, floriculture, pomology—especially grapes and all small fruits—farm implements, landscape gardening, veterinary, crop reports from all parts of the country, industrial societies, agricultural science, chemical fertilizers, news from all parts of the world, rural architecture, and a department for women.

The Rural Experiment Grounds, conducted as they are purely in the interests of readers, offer rare facilities for making the paper valuable. All new and high-priced seeds are tested at once, and reported upon according to their worth, so that subscribers have before them a trustworthy guide as to what novelties are worthy of trial. The present season, for example, we have tested, or are testing 80 different kinds of new potatoes, 25 different kinds of corn, many different kinds of wheat and oats, 60 of grapes, 66 of strawberries, all of the different kinds of raspberries, blackberries, currants, besides a rare collection of the most hardy shrubs, trees and herbaceous plants.

We ask all progressive farmers and horticulturists to examine the RURAL NEW-YORKER before subscribing for any family journal another year. For this purpose, as we have said, specimen copies will be cheerfully sent to any address. We wish to make the truth appear, and to show that those who would meet with success in land-culture cannot afford to do without the journal, and that it should be subscribed for as a measure of economy.

The price is $2 per year for single copies; $1.50 in clubs of five or over. Those who would aid in getting up clubs should send for our new premium lists and posters, which will be promptly forwarded at once. A postal card addressed to the R. N.-Y., Park Row, requesting specimen copies, premium lists, or outfits, is all that is needed.

SPECIAL NOTICE TO ALL.

The R. N.-Y. is as hitherto invariably **$2.00** *a year in advance. But in clubs of five or over,* **$1.50,** *that is* **50** *cents commission for each subscriber is allowed. Those who prefer premiums to cash must, of course, send us* **$2.00** *for each subscriber. The regular Premium List which will be sent on application, will be found to be so scaled as to allow from one to two dollars for each subscriber in the articles therein offered.*

WHAT OUR ADVERTISERS SAY.

PERHAPS a word of commendation of your paper as an advertising medium from us may not be out of place, and I certainly think it is due you. We have been, as you know, quite extensive advertisers; and while it is difficult for us to determine what one of the many papers paid us the best, yet we have felt for some time that yours was one of the best mediums which we have ever used, and we sincerely hope that it will continue to improve, not only as a good medium for advertisers, but also as an exponent of the best agricultural thought. We believe it has been and is now in excellent hands, and, judging by the past, its future progress is assured.

Yours, very truly,
W. H. BOWKER,
President Bowker Fertilizer Co.

THE fact that we are introducing many of the celebrated Cornish Organs and Pianos through your paper in new localities is all the guarantee we want that it is a valuable medium. Such we emphatically consider the RURAL NEW-YORKER.

CORNISH & Co., Organ and Piano Mfrs.

REFERENCE to our advertising books show that the RURAL NEW-YORKER is one of the very best papers on our list. It brings us more inquiries than many papers which cost double the money. Yours very truly,
S. L. ALLEN & Co.,
Mfrs. of the "Planet Jr." Implements.

OUT of the few agricultural papers that we have used extensively the past season the RURAL NEW-YORKER is one that has always made good return for our investment, and a large and thrifty patronage. It gives us pleasure to speak highly of its merits as an advertising medium. Yours truly,
B. L. BRAGG & Co.
Seedsmen, Introducers of the Top Over Corn.

WE have advertised in the RURAL NEW-YORKER a number of years and the results have always been very satisfactory. We hope to continue to use its columns, and are pleased to recommend it to others who wish to reach the best class of farmers.
Respectfully, WM. PARRY.

THE advertisement of the Dutton Mowing Machine Knife Grinder in your paper brought us very satisfactory results, and we shall continue to use your valuable publication, for this useful tool, as well as for our general business. Respectfully,
R. H. ALLEN COMPANY.

I HAVE had my card inserted in the RURAL NEW-YORKER frequently for several years, and I consider it a very valuable advertising medium. JOHN S. COLLINS,
Pleasant Valley Nurseries.

IN the course of our advertising experience we have had occasion to use most of the journals throughout the United States, and in some instances the results have been very meager. Our experience however with the RURAL NEW-YORKER has been very satisfactory and we regard it as one of the best paying papers on our list. It will, no doubt, prove a valuable advertising medium to any one wishing to reach the better class of the agricultural population.
Yours respectfully,
IND. PAINT & ROOFING CO.

THE RURAL NEW-YORKER has proven to be one of the best mediums for advertising our seeds. In fact, it heads the list.
JOHNSON & STOKES,
Seedsmen, Phila., Pa.

WE have always obtained good results from advertising in the RURAL NEW-YORKER. Regard it as one of our very best advertising mediums for reaching our customers; that is, a dollar with you will go as far, or farther, than in any other direction.
Respectfully, A. B. FARQUHAR.

THE RURAL NEW YORKER is on precisely the same footing with the Nation, the Evening Post, the New York Times and all the other good papers in which we advertise.
Yours truly,
HOUGHTON, MIFFLIN & Co.,
Publishers, Boston, Mass.

RURAL NEW-YORKER: While we do not get as many calls for our small fruit catalogue from our advertising in the RURAL as from some other papers, it does bring us an unusually fine class of customers. A class that appreciate a good thing and are willing to pay for good stock. A class of customers that stand by us every year and want every new and choice plant that we have to offer. Therefore, we consider the RURAL a very valuable advertising medium.
Truly yours, G. H. & J. H. HALE.
Elm Fruit Farm and Nursery,
South Glastonbury, Conn.

EXPERIENCE convinces us that we discriminated wisely in selecting the RURAL NEW-YORKER as a medium for making our invention known to the public.
THE DANA WINDMILL CO.
Fairhaven, Mass.

BEAR in mind that the RURAL never *sells* its premiums. We give them as payment for work. We will not, under any circumstances sell them for cash. The RURAL sells nothing and hence is not bound to praise any implement or plant except as it deserves praise.

THE RURAL NEW-YORKER is for the West, North and South, as well as for the East. It circulates on the Pacific slopes as well as in the States of the Alantic; on Southern plantations as well as Eastern farms. It is for the North, South, East and West. Its writers are everywhere.

The Premium List of the RURAL NEW-YORKER *has never been equaled for liberality by any paper in the country. One subscription agent who writes: "I have canvassed for dozens of papers, but never knew one to offer such terms as these," voices the sentiments of those who have studied our Premium List. Examine the list of premiums on page 777. Where can you make better terms?*

BOOK PREMIUMS.

We have selected the

Newest and Best Books

from the Catalogues of our leading Publishers with which to recompense those of our friends who send us new subscriptions.

The list merits a careful examination, and our readers will, no doubt, find books that they want, ought to have, and can secure with a little effort.

☞ **These Premiums are available to Present Subscribers, or those who may become so, or to Agents for Yearly Subscriptions to the RURAL NEW-YORKER at the regular price of $2 00.**

That is to say—any PRESENT subscriber who sends us a NEW subscription at $2.00 is entitled to

His Choice of any Book

offered for one subscription. If he sends us two, then he is entitled to any Book offered for two, etc. The object is

To Procure New Subscribers,

and to offer adequate pay to our friends and agents for the effort required in obtaining and forwarding them to us.

Any Person Becoming a Subscriber may then send new subscribers and be entitled to the Books, as above stated.

☞ In ordering Book Premiums write out the title and name of the Publisher in full.

☞ POSTAGE at the rate of ten cents for each dollar's worth of books must accompany the order.

THE COMPLETE WORKS OF SHAKESPEARE. Comprising his Dramatic and Poetic Works. Accurately printed from the text of the corrected copy left by the late George Stevens, Esq., with a Glossary and Notes, and a memoir by Alex. Chalmers, A. M. Royal octavo, 828 pages. With full illustrations. We know of no complete editions of Shakespeare published in this country, of equal grade and character, that will compare with the above as regards prices. The price varies from $2 to $3, according to style of binding. We will give the "Gilt Edge" edition for two subscribers and 31 cents for postage.

PERSEVERANCE ISLAND. By Douglas Frazar. (Postpaid for two subscribers.) A new book which will take the place of Robinson Crusoe. It is of thrilling interest, and at the same time full of instruction for young people. Price $1.50.

THE BOOK OF ELOQUENCE. By Charles Dudley Warner. (Given for two subscribers.) A Collection of Extracts in Prose and Verse, from the most famous Orators and Poets. Price, $1.50.

YOUNG FOLK'S HISTORY OF THE UNITED STATES. T. W. Higginson Jr. $1.50. (Given for two subscribers.) This book is having a very large sale and is one of the best juvenile histories we have ever seen.

MY LADY'S CASKET OF FLOWERS AND JEWELS FOR HER ADORNING. With Original Designs printed in Colors. By Eleanor W. Talbot. Oblong quarto. Cloth, gold and silver colors, full gilt edges. Price, $3.75 (Given for three subscribers.) This is a lovely book, suitable for a wedding, birthday or Christmas present for a lady. The various virtues and graces considered appropriate to the gentler sex are here combined with illustrations of different gems and flowers, chosen with reference to their meaning.

IN TRUST. A novel, by Amanda M. Douglass. Price $1.50. (Given for only one subscriber.) Miss Douglass is a strong and entertaining writer, and our readers who get this book will certainly want the whole series (comprising 16 volumes) written by her. This is a special offer, and we should have calls for several hundred.

Also, for ONE NEW SUBSCRIBER, we will send any one of LEE AND SHEPARD'S "DOLLAR" JUVENILES, or complete sets for as many subscribers as there are volumes in the sets, comprising the following New Books and New Editions, in attractive English cloth binding, and illustrated:

I. FAMOUS BOY SERIES, comprising: (1) The Patriot Boy, and how he became the Father of his Country; being a popular life of George Washington. (2) The Bobbin Boy, and how Nat got his learning; or, The Early Life of General N. P. Banks. (3) The Border Boy, and how he became the Pioneer of the Great West; being a popular life of Daniel Boone. (4) The Printer Boy; or, How Ben Franklin made his Mark. That is four volumes in all.

II. FRONTIER CAMP SERIES, comprising: (1) The Cabin on the Prairie. (2) Planting the Wilderness; or, The Pioneer Boy. (3) The Young Pioneers of the Northwest. (4) Twelve Nights in the Hunter's Camp. (5) Stories of emigrant perils in the Great West. (6) Exploits of hunters and naturalists. Nothing of the wild, bandit, cowboy life, but real, healthy woodlife, with its perils and prospects; such life as made Horace Greeley utter his now famous sentence: "Go West, young man."

III. GALLANT DEEDS LIBRARY, comprising: (1) Great Men and Gallant Deeds. (2) Yarns of an Old Mariner. (3) School Days. (4) Sand Hills of Jutland. (5) Tales of warlike adventures by the Crusaders. Sea stories of thrilling interest, schoolboy escapades by sea and land, and a volume of fairy stories by the great master of fairy lore, Hans Christian Andersen, make as attractive a series as boy or girl could desire.

IV. INVINCIBLE LIBRARY, comprising: (1) The Young Invincibles; or, Patriotism at Home. (2) Battles at Home. (3) In the World. (4) Golden Hair. This series contains four excellent stories, bright, adventurous, entertaining and instructive. For home and school libraries they are exceedingly appropriate.

V. LIFE BOAT SERIES of Adventures, comprising: (1) Dick Onslow among the Red Skins. (2) The Young Middy; or, The Perilous Adventures of a Boy-Officer. (3) The Cruise of the Frolic; a sea story. (4) The Life Boat; a tale of our coast Heroes. (5) Antony Waymouth; or, the Gentlemen Adventurers.

VI. NATURAL HISTORY SERIES. By Mrs. R. Lee. Illustrated by Harrison Weir, comprising: (1) Anecdotes of Animals; Their Habits and Instincts. (2) Anecdotes of Birds, Reptiles and Fishes; Their Habits and Instincts. (3) The African Crusoes; or, The Adventures of Carlos and Antonio. (4) The Australian Crusoes; or, The Adventures of an English Settler and his Family in the Wilds of Australia. (5) The Australian Wanderers; or, The Adventures of Captain Spencer, his Horse and Dog.

VII. THE LIVE BOY SERIES. Six Vols.

VIII. THE CASTAWAY SERIES. Six Vols.

IX. THE WILD SCENES LIBRARY. Five Vols.

Or for one subscription we will send two of Lee & Shepard's Handbooks, selling at 50 cents each. These include, Blunders, Punctuation, Conversation, The Earth, Elocution, The Parlor Gardener, Hints on Language, What is to be Done, etc., etc.

The above books are selected from the very complete catalogue of Messrs. Lee & Shepard, Boston, Mass. We should be glad to have our readers send for it.

We will give any book found in this catalogue as a premium. Rates quoted on application:

TEN DOLLARS ENOUGH.—By Catherine Owen. Price $1. (Given for one subscriber.) The writer of this little book shows how one dollar may either be made to do the service of two, or may by skill and care be made to produce a result (in the way of food and housekeeping) not merely twice as good as is commonly realized, but infinitely more satisfactory both to the palate and to the family happiness. She tells a pleasant story, and weaves into it recipes, descriptions, directions for cooking and housekeeping, admirable for their clearness and for their salutary effect on the family life.

UNCLE TOM'S CABIN; or Life among the Lowly. A story of Slavery. By Harriet Beecher Stowe. Price $1. (Given for one subscriber.) "Uncle Tom's Cabin" should never be permitted to go out of print. A copy of it should be kept in every family library, that succeeding generations of American children may read it, and weep over Uncle Tom as their mothers and grandmothers wept; yes, and their fathers, too. Our younger readers who have heard of, but never read this remarkable book, and older readers who have read it and would like to read it again, will thank us for putting it in their way.

BIRTHDAY BOOKS—EMERSON, LOWELL, WHITTIER, LONGFELLOW. (Either book for one subscriber, or the set for four subscribers.) Each book has a fine portrait and 12 illustrations. Elegantly bound. These are gems of books. On the left-hand pages are choice extracts from the writings of Longfellow, Emerson Whittier and Lowell, for each day of the year. On the right-hand pages are interesting memoranda—birthdays of famous persons are indicated, the occurrence of noteworthy events, and there are blank spaces for the autographs of friends on their birthdays. Price $1 each.

The above books are published by Houghton, Mifflin & Company, 4 Park Street, Boston, Mass.

SCRIPTURE READING LESSONS FOR FAMILY WORSHIP; containing in consecutive order the more devotional parts of the Bible, arranged in daily lessons for a year, with brief explanatory and practical notes and exercises in scripture history. By J. T. Chaplin. (Post-paid for one subscriber.)—This is a book long needed by the Christian public. It embraces all devotional parts of the Bible from Genesis to Revelation, and with the notes present a very complete outline of the whole. Being already selected with brief explanatory notes, they will be found very convenient and instructive for use in families and schools where the Scriptures are read. At the same time the exercises in the Bible history, at the end of the book, will be of great service to the young. Every family should have one. The price is $1.50, but we will send it for only one subscriber and postage paid.

RAMBLES THROUGH OUR COUNTRY. (For one subscriber.)—A geographical game, conducting the players through the United States of America, pointing out and impressing upon their memories the chief points of interest in the Physical Geography, industries and history of the country, and thus combining instruction,—an element which but few games possess—with amusement, and although particularly intended for the young, people of all ages find it exceedingly entertaining. A delightful excursion for a whole family. This is one of the best premiums of the kind we have ever offered, and we should have calls for hundreds of them. The game includes an elegant lithographic pictorial map of the United States, 25x35 inches, an illustrated text book, and a Tee-to-tum Counters, etc. It is enclosed in a neat box. It's former price was $2. It will be sent for only one subscriber if ten cents to pay postage is sent.

D. L. MOODY AND HIS WORK ON BOTH SIDES OF THE SEA. By Rev. W. H. Daniels, A. M. This is a book which every Christian should have, for no one can understand the nature and power of the work of this great evangelist without knowing something of his personal history. This book contains such a grouping of the facts, and such a tracing of the agencies of the great awakening under the labors of Mr. Moody, as will help the reader to see the glorious and soul-stirring picture in some degree of unity and completeness. It also contains biographical sketches of Mr. Sankey, P. P. Bliss and wife, and other co-workers with Mr. Moody, and a number of sermons, addresses, etc., by him. Price, cloth $1.25. (For one subscriber). The game and above books are supplied by the American Publishing Co., Hartford, Conn.

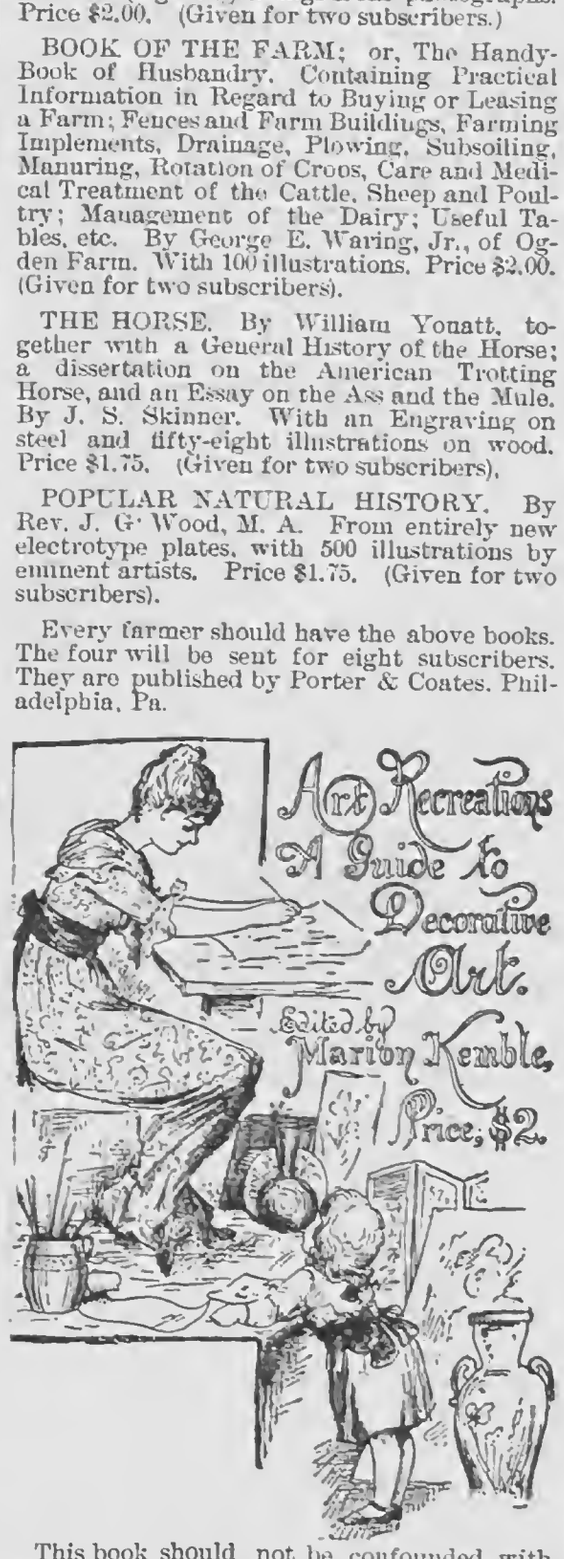
THE HORSE IN THE STABLE AND THE FIELD. His Management in Health and Disease. By J. H. Walsh, F. R. C. S. (Stonehenge). Illustrated with over 80 engravings, and full-page engravings from photographs. Price $2.00. (Given for two subscribers.)

BOOK OF THE FARM; or, The Handy-Book of Husbandry. Containing Practical Information in Regard to Buying or Leasing a Farm; Fences and Farm Buildings, Farming Implements, Drainage, Plowing, Subsoiling, Manuring, Rotation of Crops, Care and Medical Treatment of the Cattle, Sheep and Poultry; Management of the Dairy; Useful Tables, etc. By George E. Waring, Jr., of Ogden Farm. With 100 illustrations. Price $2.00. (Given for two subscribers).

THE HORSE. By William Youatt, together with a General History of the Horse; a dissertation on the American Trotting Horse, and an Essay on the Ass and the Mule. By J. S. Skinner. With an Engraving on steel and fifty-eight illustrations on wood. Price $1.75. (Given for two subscribers).

POPULAR NATURAL HISTORY. By Rev. J. G. Wood, M. A. From entirely new electrotype plates, with 500 illustrations by eminent artists. Price $1.75. (Given for two subscribers).

Every farmer should have the above books. The four will be sent for eight subscribers. They are published by Porter & Coates, Philadelphia, Pa.



This book should not be confounded with the cheap so-called "art-books" with which the country is flooded. It is rather a series of lessons which will enable almost any person of ordinary intelligence and taste to beautify their homes at a trifling cost. In all art matters pertaining to home decorations, for presents to friends, for contributions to fairs and private exhibitions, and for general sale to make money, this book will furnish desirable information and assistance.

THREE HUNDRED DECORATIVE AND FANCY ARTICLES SUITABLE FOR PRESENTS. For all occasions, such as Weddings, Birthdays, Christmas, &c., &c., and for Fairs. Illustrated with nearly 100 Decorative Designs. By Lucretia P. Hale and Margaret E. White. (Given for two subscribers.) It also contains a special chapter for Christmas, with suggestions for Christmas Eve, Hanging the Stocking, Christmas morning, Hiding the Presents, Christmas Dinners, Table Decorations, Menus, Cards, Christmas Tree, Parties, Entertainments, Post Office, Santa Claus, etc., etc. Beautifully printed on tinted paper and bound in muslin. Price $1.50. Published by S. W. Tilton & Co., Boston.

POPULAR FAMILY ATLAS OF THE WORLD. Sent postpaid for only one subscriber. This Atlas contains 24 maps; neatly colored, and with all the recent changes and discoveries. The size is 10x12 inches. Every family should have a good atlas. Although sent for only one subscriber, yet it will be found very convenient and instructive, and as accurate as the most expensive. Published by J. B. Lippincott Company, Phila.

SMITH-PELOUBET'S DICTIONARY OF THE BIBLE. Given for two subscribers. This book contains Antiquities, Biography, Geography, Natural History and Literature of the Bible. Latest Researches and References to the Revised Version of the New Testament. Over 800 pages, with eight Colored Maps and 440 Illustrations. This is a valuable book. It contains "the fruit of the ripest biblical scholarship of England." Every Sunday School teacher and Bible student should have one. Price with unique binding in black and gold, $2.00. Published by Porter & Coates, Philadelphia, Pa.

PICTORIAL FAMILY BIBLE. (Given for four subscribers.) This splendid Royal Quarto Edition of the Family Bible contains 1,300 pages and is made self-explaining, being a complete and concise Library of the Holy Scriptures, from the most exhaustive researches. The amount of matter (extra) aside from the Bible proper, were it bound in separate volumes, would cost at least $20. This matter will be found reliable, exact and clear. Illustrated with 600 engravings, which alone cost more than many other bibles in the market. These Bibles are 10½ inches wide by 12½ long, and from 4½ to 5 inches in thickness, containing the old and new testaments, concordance, Lives of the Reformers and Translators, illustrated, Scenes and Events in the Life of Christ, illustrated, Temple of Solomon, Heads of the Apostles, family record and marriage certificate, colored map of Palestine, and a vast number of other interesting bibical articles, without photograph cards. By a special arrangement with A. J. Holman & Co., Philadelphia, Pa., we are enabled to send this, one of the best of the medium priced editions of the Bible (price $4.50) for only four subscribers. Send to them for descriptive circular.

ARCHITECTURAL STUDIES. One large Quarto Vol. Cloth. Price $5.00. Given for five subscriber. Containing 60 large Lithographic Plates, treating on the following subjects:

Part 1—Low-cost Houses, including prize designs, with elevations, plans, details, specifications, bills of materials and estimates of cost. Twelve large (11x14) plates of practical designs, costing from $500 to $3,000. Part 2—Store Fronts and Interior Details.—Twelve plates and descriptive letterpress. Part 3—Stables.—Containing 12 plates of stables, suitable for village lots ranging in cost from $300 upwards. Part 4—Seaside and Southern Houses.—Twelve plates of designs for cheap houses, with ample verandas, suited to a summer climate. Average cost, $1,500. Part 5—Outbuildings.—Containing 12 plates of designs of small stables, summer houses, pavilions, privies, fences, gates, etc. Each of these parts may be obtained separately when desired. Paper portfolio, 12 plates and descriptive letterpress, $1.00 each. Sent for One Subscriber. W. T. Comstock, Publisher, 6 Astor Place, New York.

THE FAMILY CYCLOPÆDIA OF USEFUL KNOWLEDGE. Sent, post paid, for one subscriber. This book is profusely and elegantly illustrated, and is conveniently divided into departments, as follows: Biography, History, Natural History, Travels, Manners and Customs, etc.; The World Illustrated, Useful Arts and Manufactures, Trees, Plants, Fruits,

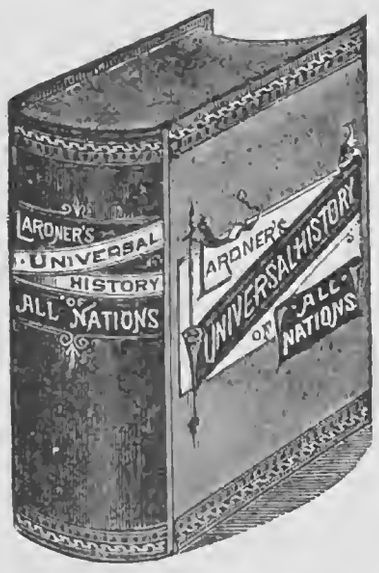
etc.; Great Inventions, Mining, Wonders of the Sea, Familiar Science, Law for the Masses, Statistical and Miscellaneous. It is a vast storehouse of useful and entertaining knowledge. No cyclopædia ever heretofore published at twice the cost is to be compared with this book in point of artistic make-up, beauty and excellence of illustration, and quality of contents. The Family Cyclopædia of Useful Knowledge is a large and handsome book of 544 pages, 12mo, printed upon fine paper and elegantly bound in cloth, embellished with artistic designs in black and gold. It contains 273 beautiful illustrations the original cost of which was over $5,000.

LIVES OF OUR PRESIDENTS. Sent, post paid, for one subscriber. This book contains the life of every man who has occupied the Presidential chair, from George Washington to the present incumbent. The biographies are not brief sketches or outlines, but are full, complete and exhaustive, narrating every prominent event in the life of each President, from the incidents of his boyhood down to his death, or to the present period, together with extracts from his most important speeches and public documents. Incidental to the biographies we have almost a complete history of our country. Thus are history and biography blended in this book, and the result is a work of the most interesting and instructive character. It is written in such an entertaining manner that young people will read it as readily as a novel, from which no useful information is gained. It also contains 100 pages devoted to the Early History of America, from the discovery by Columbus to the period of the Revolutionary War. "Lives of our Presidents" is a large book of 544 pages, 12mo, handsomely printed from large type upon fine paper, and elegantly bound in cloth, embellished with artis-

tic designs in gold and black. It contains a full-page portrait, reproduced from a steel plate, of each of the Presidents, with a facsimile of his autograph, together with many other beautiful and interesting illustrations, such as the birthplaces and early homes of the Presidents, historical scenes and incidents, public buildings, etc.

The above books will be sent, post paid, for $1.00 by F. M. Lupton, Publisher, 3 Park Place, New York.

COMPREHENSIVE HISTORY OF THE GREAT CIVIL WAR. Given for one subscriber. No fiction ever equaled this wonderful work in thrilling interest, and its author, Dr. James Moore, has won for himself an immortal fame by the graphic and fascinating story of the



greatest war of modern times. The lives of the heroes Grant and Sherman, the gallant Phil Sheridan, brave-hearted Stonewall Jackson, the gentlemanly scholar, Robert E. Lee, the doings of the Irish Brigade, and all receive careful and masterly treatment. A breathless interest is awakened with the opening chapter, which continues until the final sentence.

THE PEOPLE'S HISTORY OF THE UNITED STATES. Given for one new subscriber. It is a work which every citizen ought to possess. From the Discovery of America to the election of Grover Cleveland as the President of the United States, our country's history is told with a vividness and eloquence which makes it acceptable to all.

THE FARMERS' AND STOCKBREEDERS' GUIDE. Given for one new subscriber.

Forty-eight out of every hundred of our male population are engaged in Farming and Stockraising, and we offer them a book which if directions are followed will give many dollars to its fortunate possessor. It is compiled from the writings of Youatt, Mills, Skinner and Clater. The diseases of Oxen, Sheep, Swine and Horses, with the causes, symptoms and treatment, are given with such simple directions that every farmer may become his own cattle doctor. It treats of the anatomy of all domestic animals, and practically deals with the use of oxen, breed of sheep and stable management. It is invaluable to every one who has to do with the farm or stable.

LARDNER'S UNIVERSAL HISTORY OF ALL NATIONS. Given for one new subscriber. This work is a Cyclopedic History, giving each nation's story separately and arranged in epochs, so that the World's History passes in panoramic view before the reader. It contains over 380 illustrations, and as an authoritative work has been approved and indorsed by students and educators generally.

The four handsome volumes form a Complete Library of Useful Information. All sent for one subscriber, *new* of course.

They are well printed, profusely illustrated, exquisitely bound in cloth, embellished with chaste designs in gold, and being written by the most distinguished authors are reliable authorities. The four books contain 2,000 pages, and are fascinating, entertaining, instructive and useful books. Fathers could not make a more suitable present to their sons. Price, $1 each. Published by the World Manufacturing Co., 122 Nassau Street, New York.

THE LEISURE HOUR. For one *new* subscriber. This library is printed on good paper in clear type, and embraces complete novels and other works of interest and value, by well-known and popular authors. A specimen copy containing a catalogue will be sent free by F. M. Lupton, publisher, 3 Park Place, New York city. We will send fifty numbers, worth $1.50, for a new subscription. Send for a specimen copy, and you will be surprised at this offer.

LITERARY.

HOW TO STRENGTHEN THE MEMORY. (M. L. Holbrook & Co., New York. Price, $1.25.) We consider this, in many respects, a remarkable book. It is well worthy the thoughtful attention of all who wish to possess that most desirable aid—a good memory. The idea is advanced that the memory can be cultivated and improved by a series of mental gymnastics, just as the muscles of the arm can be developed by proper training. This we know to be true from our own experience. The best foundation upon which a good memory can be based is robust health. Just as a nervous disease will change the temper, and completely alter the features and expression of a mild and gentle person, so a constitutional weakness will in time almost ruin the ability to recall facts and ideas. We remember things best when we are fresh and vigorous. All know how a tired feeling dulls the keenness of recollection. Facts learned while we are tired are always hardest to recall. A perfect circulation of healthy blood is absolutely essential to the development of a good memory. Good food and plenty of sleep cannot be dispensed with. Liquor, tobacco and drugs that excite the nervous system improve the memory for a time, but eventually cripple it. The memory is made unreliable, and impressions received while under these influences are most easily forgotten. Memory appears to be a very variable faculty. Some people seem to have natural memories. Some authors can repeat pages from their works even years after they were written. In such cases the facts pertaining to their characters were as deeply impressed upon the brain that total erasure was impossible. There are slow thinkers and quick thinkers. One studies a moment to arrive at a fact that is reached by the other like a flash. The slow memories are generally most reliable. Memories are destroyed by overwork, worry and an attempt to carry too much on the brain at one time. Poor food and unhealthy surroundings, dissipation, or anything that tends to create an abnormal circulation of unhealthy blood, will surely impair the memory. Two points are absolutely necessary if we would improve the memory. We must cultivate attention and method; there must be a logical association of ideas, so that one fact will call up another, until the desired fact is reached. We are often at a loss to remember a face or a fact. Thousands of other ideas crowd into the mind, but the right one is hidden. Suddenly it comes upon us like a flash. We strike some fact in the chain connecting us with it, and in an instant it all comes to mind. The design is to connect these chains one with another; to have the events of life that we wish to remember closely connected. To cultivate a good memory one must live earnestly. He must cultivate attention and learn the art of forgetting unimportant things. Much can be done by constant practice. The most simple exercise is to devote half an hour each night to thinking carefully over the events of the day. The idea is to give a history of your movements; people you have met, things you have seen, what you have done, etc. This practice carefully carried out from day to day will strengthen any defective memory. We once tried the plan of giving a few moments each night to writing out our vocabulary. We tried to think of every word that we really understood. The practice resulted in fixing the words firmly in the mind and at the same time served to show how few words the average person can control. Shakespeare is said to have used about 12,000 different words in his plays. We do not believe that the average vocabulary is over 800. This practice of writing out the vocabulary tended to increase it by developing a desire to learn new meanings, and also gave the memory new strength. The rules contained in the book under consideration are sensible and simple. We are glad to commend the work to those who are interested in this subject.

THE MAKING OF PICTURES, by Mrs. Sarah W. Whitman, (The Inter-State Publishing Co., Boston,) is the work of an artist. She evidently understands what she writes about. Her advice seems to be sensible and practical. We think this little volume, carefully studied, will be a help to those who desire to "make pictures." We are glad to see that the author insists that excellence in drawing can only be obtained by thorough preparation and careful and pains-taking study. There are too many "botchy" artists now. Two people draw lines on paper; one line is a black mark, the other speaks out the result of years of study and care. The ability to sketch or paint fairly well will make many an otherwise monotonous life pleasant. Art should be pursued for itself alone. There is no money in it for the many who want to be artists simply because the life is an easy one. There is but little ease in any successful life. As a means of beautifying the home or of cultivating our finer feelings by the ability to copy scenes or colors that please us, a fair knowledge of art is a most desirable accomplishment.

A WHITE HERON, AND OTHER STORIES, by Sarah Orne Jewett (Houghton, Mifflin & Co., Boston, Price $1.25), is a good book. Most of the stories were originally printed in the Atlantic and Harper's. They are as good as new in their present dainty dress. We like them more and more as we read them over. There is a quaint charm about them that many far more pretentious books cannot convey. Who can read that last sentence of the "The Gray Man" without dropping the book for a moment to think? The poor, amiable "Dulham Ladies" and their first experience with false hair can hardly be forgotten. There is a wonderful pathos mingled with a quaint humor to be found in these pages. There is nothing sensational or blood-stirring in the stories, but they awaken the right kind of feeling. The best story in the book is Marsh Rosemary. It is the story of an old maid who married a worthless young fellow, just because he proposed to her. Of course they could not live happily. He ran away from her at last and never came back. She thought him dead until years after; she heard of him living in a distant town married to another woman. In her anger and shame she went to his home to expose him. She came to his home after dark, and saw him through the window. As she watched him she understood why he had left her. She could never have been a companion for him. He had married a woman of his own age who had tastes, feelings and ambitions like his own. She was making a man out of the worthless scamp. He leaned over the cradle and raised the baby to show its latest trick to his wife. The shame-eaten, weary woman on the outside saw it all—herself unseen. She thought that this man never could care for her again. By exposing him she would only spoil his chances forever, break the new wife's heart and fill the baby's life with shame. She turned and walked silently away—like another Enoch Arden—back to her old lonely life. There are many who will question her judgment in doing as she did, but few can read the story of her struggle without feeling glad that she did not speak.

THOSE who read the November Harper's will be interested in studying the faces of New York literary men there given. As a rule, people are disappointed in such faces. When we judge a man by his writings we feel that somehow his thoughts must have written themselves on his face, so that we can read them there. We seldom find this to be so. There is always a disappointment in the sight of a great man. It would be better if we could see the man first and enter into his thoughts afterwards. The majority of writers and public men would do well to make themselves more of a mystery and keep their faces out of print. The picture of E. P. Roe will, we think, surprise most of his readers. They have an entirely different man in mind. Julian Hawthorn looks like his father, but seems to have more force, and yet a keener sense of fun.

THE noblest characters are not always sure to live in song and story. Men and women having crosses from which the bravest might shrink, live and die unheeded. The world knows nothing of their greatness unless some dear friend forces the evidence into view. An instance of this is seen in the life of Judge Richard Reid, of Kentucky. Our readers may remember something of the circumstances connected with his death. He was publicly beaten most shamefully by a brother lawyer. Local tradition left but one course open to him—that was to kill his assailant. This he could not do. As a Judge he could not break the law, and as a Christian he could not shed blood. He did his best to hold to his convictions, even in a community where men and women thought him a coward. He endured it until the tortured heart broke, and he took his own life. The story of this crime, told by his wife, is a wonderful book. W. D. Howells well says in Harper's that "he wishes, for the sake of civilization, of religion, that the book might have a wide currency"

Invalids and Others Seeking Health,

Strength, and Energy, should avoid Drugs, Secret Medicines, etc., and send for "The Review," or "Health and Strength Regained," a large Illustrated Journal, published entirely for their benefit.

COPIES FREE. COPIES FREE.

IT TREATS ON HEALTH, HYGIENE, PHYSICAL CULTURE, AND MEDICAL SUBJECTS, and is a complete encyclopædia of information for suffering humanity afflicted with long-standing, chronic, nervous, exhausting, or painful diseases. Every subject that bears on health and human happiness receives attention in its pages; and the many questions asked by ailing persons and invalids who have despaired of a cure are answered, and valuable information is volunteered to all who are in need of medical advice. No similar work has ever been published. Every sick or ailing person should have it.

YOUNG AND MIDDLE-AGED MEN, and others who suffer from nervous and physical debility, exhausted vitality, premature decline, etc., are especially benefited by consulting its contents. Everything such sufferers wish to know is fully given in its pages. If in need of medical aid or counsel, read it before "doctoring" or investing in medicines or appliances of any description, and you will save time, money, and disappointment. If using medicine, or medical treatment of any kind, read it and learn the better way.

THE REVIEW exposes the frauds practiced by quacks and medical impostors who profess to "practice medicine," and points out the only safe, simple, and effective road to health, vigor, and bodily energy.

Beware of the sham curative articles called Shields, Generators, Girdles, Pads, Brushes, Corsets, Clothing, Plasters, etc., now deceptively advertised as Electric, Voltaic, or Magnetic. These articles are as entirely spurious as the advertisements concerning them are insidious. This can be easily detected by a simple test which is fully explained in THE REVIEW.

Electric Belts and all curative appliances are treated upon; all about them. Belts on thirty days' trial (?) and other fallacies reviewed. Thousands of dollars saved nervous-debility sufferers and others by the advice given.

Reader, are you afflicted and wish to recover the same degree of health, strength, and energy experienced in former years? Do any of the following symptoms, or class of symptoms, meet your diseased condition? Are you suffering from ill-health in any of its many forms consequent on a lingering, nervous, chronic, or functional disease? Do you feel nervous, debilitated, fretful, timid, and lack the power of will and action? Are you subject to loss of memory, have spells of fainting, fullness of blood in the head, feel listless, moping, unfit for business or pleasure, and subject to fits of melancholy? Are your kidneys, stomach, urinary organs, liver, or blood in a disordered condition? Do you suffer from rheumatism, neuralgia, or other aches and pains? Are you timid, nervous, and forgetful, with your mind continually dwelling on the subject? Have you lost confidence in yourself and energy for business pursuits? Are you subject to restless nights, broken sleep, nightmare, dreams, palpitation of the heart, bashfulness, confusion of ideas, aversion to society, dizziness in the head, dimness of sight, pimples and blotches on the face and back, and other despondent symptoms? There are thousands of young men, middle-aged and old, who suffer from nervous and physical debility. There are thousands of females broken down in health and spirits, and who, from false modesty or neglect, prolong their sufferings.

Why further neglect your health and future happiness, or continue to be dosed, drugged, and quacked, when THE REVIEW, which costs you nothing, teaches the true and only way to permanent health, strength, and vigor?

"The Review," or "Health and Strength Regained,"

Contains particulars and information worth thousands to suffering humanity.

THE REVIEW is now in its ninth year of publication. Complete specimen copies mailed free. Address, naming this paper,

Publishers REVIEW,

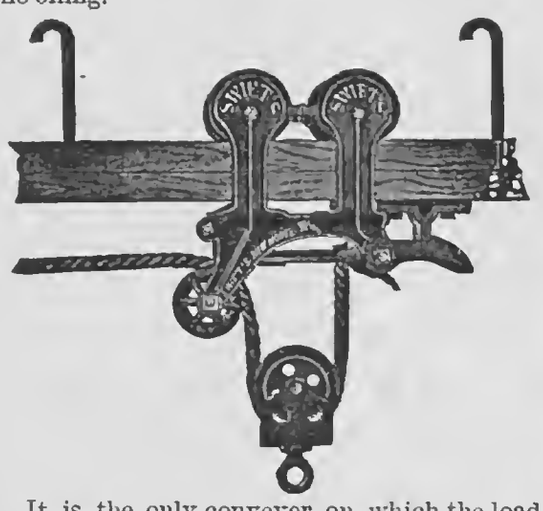
THE Premium List of the RURAL NEW-YORKER has never been equaled for liberality by any paper in the country. One subscription agent who writes: "I have canvassed for dozens of papers but never knew one to offer such terms as these." Voices the sentiments of those who have studied our Premium List.

☞ Note this offer.

Swift's "New Model" Hay Conveyer.
Given for Six Subscribers.

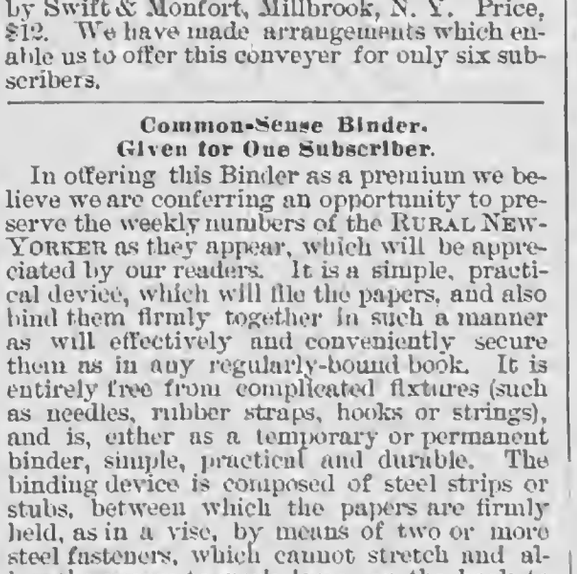
This conveyer is equally adapted to the unloading of hay or grain, or for use in factories, mills or storehouses; in fact, wherever goods are to be elevated or carried. It runs on a single wooden track, suspended on hooks, allowing it to swing in line with the load and avoiding all cramping. Its wheels have broad faces and run on chilled iron, anti-friction rollers, therefore it runs very easily and needs no oiling.



It is the only conveyer on which the load can be raised or lowered, or held in any position along the track, and this feature adapts it to use in mills and storehouses, where it has many advantages over an elevator. It is made by Swift & Monfort, Millbrook, N. Y. Price, $12. We have made arrangements which enable us to offer this conveyer for only six subscribers.

Common-Sense Binder.
Given for One Subscriber.

In offering this Binder as a premium we believe we are conferring an opportunity to preserve the weekly numbers of the RURAL NEW-YORKER as they appear, which will be appreciated by our readers. It is a simple, practical device, which will file the papers, and also bind them firmly together in such a manner as will effectively and conveniently secure them as in any regularly-bound book. It is entirely free from complicated fixtures (such as needles, rubber straps, hooks or strings), and is, either as a temporary or permanent binder, simple, practical and durable. The binding device is composed of steel strips or stubs, between which the papers are firmly held, as in a vise, by means of two or more steel fasteners, which cannot stretch and allow the papers to work loose, or the book to sag from the cover; the back being flexible, adjusts itself to any thickness, hence the volume always corresponds to the actual thickness of the papers bound.

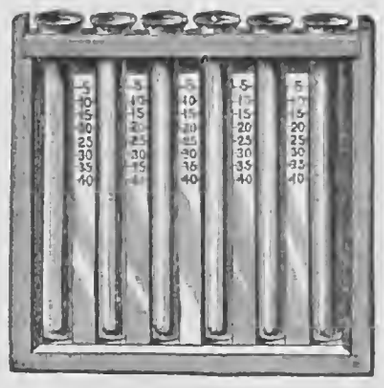


These binders have black cloth sides, upon one of which is stamped the name of the RURAL NEW-YORKER, thus making a neat volume, which would not be out of place upon the library table. We presume most of our readers preserve their RURALS, and we trust they will secure one of these handsome and convenient articles for that purpose.

The binders are made and furnished by the well-known house of Asa L. Shipman's Sons, No. 10 Murray Street, New York, who make twenty-six different sizes for music, magazines, pamphlets, and periodicals of all kinds.

Edson's Cream Tester.
For One Subscriber.

The plan adopted by the most successful dairymen of testing the milk of each cow in their herd has led to the introduction of the

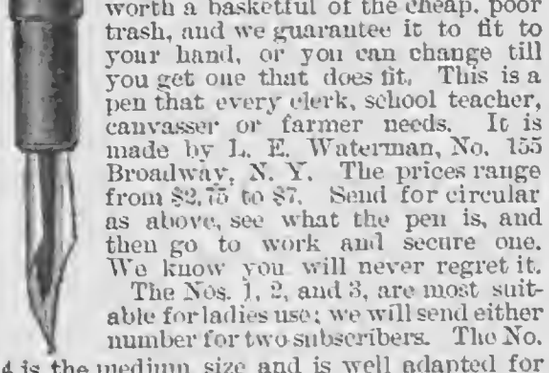


cream tester. The one here offered is practical, economical and accurate. It is made and sold by Wyman L. Edson, Union Centre, Broome Co., N. Y. Price of a 6-glass cream tester, $1, post paid. Send for a circular.

The Ideal Fountain Pen.
Given for Two Subscribers.

A farmer or any one else who fails to use every labor saving devise of merit makes a mistake. If you spend five minutes every day for a year getting out your inkstand and looking up your pen, you lose in a year, nearly three working days to say nothing of loss in worry and ill nature over dry ink-stands and broken or rusted pen-points. The Ideal Fountain Pen is a labor-saving implement just as much as is a harvesting machine or a sulky plow, and everyone who has writing to do should have one. It is a pen for every-day use at the desk, or can be carried in the pocket and used when occasion requires. It is a first-class gold pen attached to a hard rubber pen-holder, carrying ink sufficient for from 12 to 16 hours continuous writing. The entire pen is plainly shown in the cut. The handle or inkholder is made in two pieces, the point section and the barrel, which are secured together by a screw joint, at which place it is opened for filling with ink. The pen (a first-class gold pen) is held in the point section by the feed bar, which also carries the ink from the reservoir to the pen only so fast as used up in the writing. The fourth piece is merely a cap which covers the pen when not in use, to protect it from injury in the pocket, and also to prevent the ink from drying up, and when removed from over the pen, it is put on as shown in cut, to lengthen the holder for use in writing. We have used this pen for 15 months, and can fully recommend it to every one as the best pen we have ever seen Last year we handled hundreds, giving it as a premium for four subscribers. It is now offered for only two subscriptions, and every one of our friends should secure one. We do not wish our readers to confound this with the cheap fountain pen, or with the old stylographic pen, as it is fully equal to any gold pen made, and is worth a basketful of the cheap, poor trash, and we guarantee it to fit to your hand, or you can change till you get one that does fit. This is a pen that every clerk, school teacher, canvasser or farmer needs. It is made by L. E. Waterman, No. 155 Broadway, N. Y. The prices range from $2.75 to $7. Send for circular as above, see what the pen is, and then go to work and secure one. We know you will never regret it.

The Nos. 1, 2, and 3, are most suitable for ladies use; we will send either number for two subscribers. The No. 4 is the medium size and is well adapted for ordinary use. We will send one for two subscribers. The larger sizes, No. 5, 6 and 7 will be sent for three, four and five subscribers respectively. If you desire the pen sent by registered mail send 10c. for fee. Farmers, Clergymen, Boys, Girls, School-teachers. Everybody, here is a chance you cannot afford to neglect. No more useful or appropriate present can be found for Christmas, New Year's or birth-day, and you can earn one with a little effort. Send to L. E. Waterman, 155 Broadway, N. Y., for circulars.

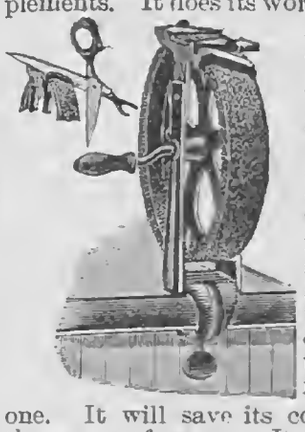


Given for One Subscriber.

Ladies don't buy a new carpet. If you wish to be economical, you can cover those worn places with home-made rugs. If you do not have enough bright colored pieces in your rag bag, you can color them at a trivial expense with the Pearl Rug Maker; many ladies make an entire carpet. When making large rugs or carpets, it is advisable to make them in sections, or pieces about 1¼x2 feet, and then join them by sewing the edges securely together on the back. (This is fully explained in the illustrated directions.) It can be used on any sewing machine or by hand. Price, postpaid $1. Supplied by the Pearl Art Co., 23 Union Square New York City.

The "Household" Patent Emery Wheel Knife Grinder.
Given for One Subscriber.

This valuable machine meets the demand for a practical and inexpensive article for sharpening Knives, Scissors, and other cutting implements. It does its work quickly and effectively. The Adjustable Table with Scissors Guide, enables anyone to sharpen knives or scissors properly. It can be raised or lowered as desired. The wheel is 6 x 1, with rim of solid emery, and warranted durable. The Machine is fastened to a table or shelf by turning a thumbscrew. Every family should have one. It will save its cost many times in the course of a year. It will be sent to any address by the Crystal Emery Wheel Co., of Northampton, Mass. for $1.50 or we will send it for one subscriber.

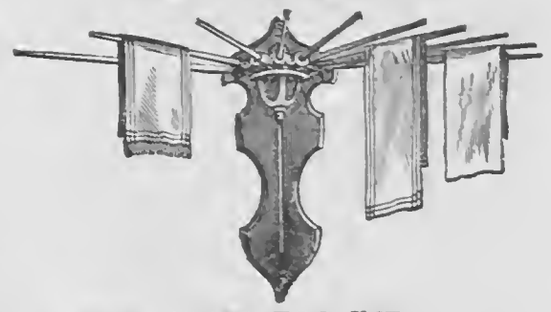


"Grand Rapids" Carpet Sweeper.
Given for Two Subscribers.

An implement which saves labor in the house is just as important as a labor saving device for outdoor use. The Grand Rapids sweeper possesses all the qualities of broom and dust-pan combined, its brush being so constructed as to be perfectly self-adjusting under the slightest pressure. Lightly running, it will take up anything that a broom will, from any kind of carpet, while if pressure is given to it as with a broom, to remove dirt,

imbedded in the carpet—still running easily—it will work wonders, being more effective than any broom. It is adapted for the lightest as well as the heaviest sweepings. Its case is unique in shape, made of rich woods, and handsomely hand decorated, which, with the contrast afforded by the color of the rubber band encircling it, makes it the handsomest as well as the best of carpet sweepers. It sells for $3, and is manufactured by the Bissell Carpet Sweeper Company, Grand Rapids, Mich. Eastern branch, 103 Chambers street, New York.

Empire Drying Bars.
Given for One Subscriber



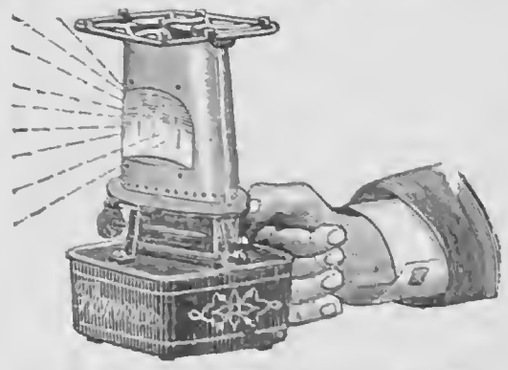
OPENED FOR USE.

CLOSED.

This is one of the neatest, most compact and best made towel or clothes racks for drying purposes in the market. It requires small space when in use and can be folded up out of the way when not wanted. It is nicely finished, and the castings are galvanized. Its capacity when opened is ten arms each two feet in length. The price is $1. It is made by the Empire Wringer Co., Auburn, N. Y., who also make the celebrated Empire Wringer.

The "Florence" Lamp Stove.
Given for Two Subscribers.

The cut below represents a lamp stove of such dimensions as to be easily carried about and yet so thoroughly made as to meet the requirements of both a stove and lamp. It illu-



minates the room as well as a large table lamp, and affords sufficient heat to boil a quart of water in eight minutes. It is absolutely safe, and free from odor. The price is $2, and it is manufactured by the Florence Machine Company, Florence, Mass.

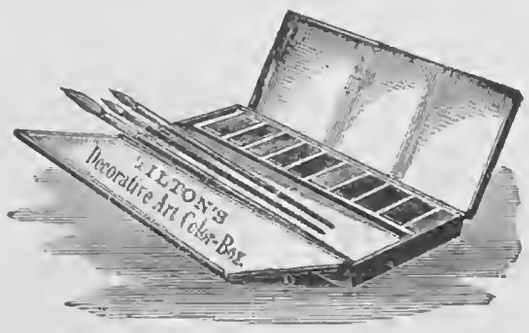
Torrey's Pocket Folding Scissors.
Given for One New Subscriber.

These handy little scissors are sharp pointed and are readily opened for use, but when closed the points are firmly held and protected by steel sheaths. They are perfectly safe and will please you. Made by J. R. Torrey & Co., Worcester, Mass.

"Stop Thief" Scale.
Given for One Subscriber.

This scale will weigh from ½ oz to 10 lbs., and is one of the most popular premiums we have ever offered. It retails for $1.15, and is worth it.

Artist's Outfit.
Given for One Subscriber, with 10c. for postage.



How to Learn to Draw and Paint in Water Colors Without a Teacher, and ten moist water colors and three brushes in a japanned tin box.

The above is a complete outfit for learning to paint in water colors without a teacher.

The book is a series of introductory lessons, in Drawing and Painting in Water Colors, by Marion Kemble. It is more than a text book. It is a series of lessons, and should be appreciated as such.

Either of the above sent by mail on receipt of 50c., or both for $1 by S. W. Tilton & Co., 333 Washington street, Boston.

Lansing Spring Tooth Harrow.
Given for 15 Subscribers.

This harrow has many advantages over the other so-called "floating" harrows. The peculiar shape of the frame enables it to work over rough or uneven ground. The construction and shape of the teeth are such that the frame is carried clear of the ground while the dirt is cut or sliced, instead of being pushed aside. It can in five minutes be adjusted to run shallow or deep or for hard or soft ground: this is done by changing the pitch of the teeth. In this harrow the teeth and spring are separate and not liable to break at the same time, this makes the cost of repairing merely nominal. Besides all these, the use of coiled springs gives greater freedom to the action of the teeth, enabling it to do good work in strong, rooty ground, so bad that the ordinary spring-tooth could not be used. Made by E. Bement & Sons, Lansing, Michigan. Price $25.00.

The Improved Root Corn Sheller,
Given for 10 Subscribers.

It requires no more time or labor to shell corn properly than it does to shell it in the slovenly, incomplete way of the olden times, but it requires a better implement. With some of the old fashioned shellers, we have seen corn enough left on the cobs to almost pay the cost of the shelling. The Root Sheller cleans the corn in the best possible manner, ready for the market. It is made with steel springs throughout, and is adjustable for corn of all sizes. The construction of the shaker device is most complete and durable. Each sheller has two casters, or rollers, fastened within an inch of the surface of the frame: this when tilted, will place the entire sheller on rollers, and can be moved with great ease. It has wrought iron shafts all through and is finished in the best possible style; capacity, by hand, 200 bushels, and 500 bushels by power per day. Price with shaker, $20. Given for 10 subscribers, or the single spout sheller price $10, for five subscribers. Supplied by The Spangler Manufacturing Co., York, Pa.

Any of our present subscribers, or any one becoming a subscriber or anyone choosing to act as an agent who will send us one new subscriber will be entitled to any of the premiums offered for one subscriber. The object is to offer compensation to all who will assist in increasing the circulation of the RURAL NEW-YORKER. THE ONE-SUBSCRIBER OFFER IS FOR NEW SUBSCRIBERS ONLY.

Rural Topics.

CORRESPONDENTS' VIEWS.

MORE PLAY—LESS WORK.

It is about time a halt was called on the people who are so wonderfully anxious to find something for the farmer to do in every moment of his spare time. There is no end to the "odd jobs" that are proposed to keep the farmer out of mischief. Why should the farmer, of all men, be urged to turn himself into the "busy bee?" He works too hard now. He sticks too closely at his business. He doesn't know what is going on around him because he thinks he hasn't got time to stop and find out. If anybody wants to learn the truth of the old song, "Work while you work and play while you play," it is the farmer. A business man will rush into New York and do an immense amount of work in eight hours and then go home to enjoy himself. The farmer goes slowly through his chores, stops to talk with every visitor and trains himself to move as slowly as possible. The consequence is he never has time to go anywhere—so he thinks—the paper is unread and work accumulates. If farming is a business, the farmer has got to be a business man. He must push his work, do it in a reasonable time, and then quit. I say, instead of hunting around for new jobs, hunt for a good chance to put in a holiday. This work, work, work, and grind, grind, grind, not only drives the boys away from the farm, but it drives the best part of the man out of the farmer. I am glad to see this talk in the papers about 10 hours on the farm. It can't be done? How do you know? Did you ever try it? The farmer has got to change his mode of life before he gets his place and his political rights. He has got to do his work in shorter time by pushing it harder, and to take more time for pleasure and information. Any man who has spent 15 minutes in gossip with a neighbor who came to borrow a rake, knows how much he can compress his working hours, if he cares to do so. I have taken plenty of quarter-days, here and there, to play ball or go fishing. I can find the time to go to gatherings now and then and still keep my work up. We do work enough now. We don't want to add more to it, but we want to improve what we do. What do we live for anyway? To grind ourselves into a bank account, or to make the most we can out of life? I have my own idea on the subject.

Orange Co., N. Y. C. H.

Last Spring I wrote to the RURAL asking about new potatoes. The answer decided me to try the Empire State. I procured a barrel from Leonard, of Chicago, which cost here $6.85. After digging them I find my account with the RURAL to stand about as follows:

Yield on eight rows Empire State, salable, 45 sacks; yield on eight rows of main crop, 23 sacks, making a gain of 22 sacks of about 110 pounds each. This gives me

24 cwt. @ 80 cents	$19.20
Less cost of seed	6.85
	12.35
Seed of Empire State sold	7.95
Total gain	$20.30
By gain over potatoes tried through kindness of RURAL	$20.30
Less two years' subscription	4.00
Net profit	$16.30

Add to this the entertainment and general information I have obtained from the paper. Does an agricultural paper pay?

Weld Co., Colorado. WILL. D. SAWYER.

I HAVE, perhaps, one-third of a pint of potato seed, the product of a very fine white potato that I received from the product of seed of the wild potato gathered in Central America about 18 years ago. This seed is the third generation. The potato from which the seed came grows to good size, a large yielder, and but few below the market size. Very white flesh, fine flavor, and excellent quality. From 29 feet square of ground, very small amount of manure, and clean level culture, I raised this season 11½ bushels of marketable potatoes. Only little less than half a bushel small, and had a half bushel of seed-balls from which the seed came. From the time of planting until dug there was not rain enough to wet the ground one inch deep.

Chautauqua Co., N. Y. E. S. B.

THE Premium List of the RURAL NEW-YORKER has never been equalled for liberality by any paper in the country. One subscription agent who writes: "I have canvassed for dozens of papers, but never knew one to offer such terms as these," voices the sentiments of those who have studied our Premium List. Examine the list of premiums on page 777. Where can you make better terms?

LEE AND SHEPARD'S FALL BOOKS.

ANOTHER TRIUMPH IN THE REALM OF ART.

NATURE'S HALLELUJAH.

From Original Designs by IRENE E. JEROME, Author and Artist of "One Year's Sketch Book," "The Message of the Bluebird," etc.

Presented in a series of nearly fifty full-page illustrations (9½x14 inches), engraved on wood by GEORGE T. ANDREW. Elegantly bound in gold cloth, full gilt, gilt edges, $6.00; Turkey morocco, $12.00; Tree calf, $12.00; Spanish calf, $12.00.

Miss Jerome's second book will be another surprise to those who believe that genius can only be crowned after years of trial. The enthusiastic young artist not only shows improvement in every page of her new book, but has succeeded in producing novel pictures of great beauty and variety from fresh points of observation, making a twin volume that is in no wise an imitation. It is a realization of what the Chicago Advance said in a glowing notice of her first books:

"Miss Jerome has the quiet determination and earnest spirit of one who feels that the object of life is to grow, and it is wonderful to note how quickly she casts aside the obstacles that arise in the way of her onward march. She possesses great fertility of fancy, and an exuberant sense of the beauty of outward objects. Her pictures make one more in love with Nature; more ready to perceive—

The voice of the Deity, on height and on plain,
Whispering those truths in stillness, which the word
To the four quarters of the world proclaims.

UNIFORM WITH ONE YEAR'S SKETCH BOOK.

Comprising 46 full-page pictures, 9½x14 inches. Elegantly bound in gold cloth, full gilt, gilt edges, $6.00; Turkey morocco, $12.00; tree calf, $12.00; Spanish calf, $12.00.

The reigning favorite of two holiday seasons, and now the most popular of "All the Year Round" books, since the large sale continues through the year. New editions in the various styles are in preparation for this season.

"It is a very remarkable book, and the publishers have been well repaid for their outlay in presenting it in this elegant dress in which it greets our eyes. It is a book to charm the soul. We could spend hours gazing upon these marvelous views of flowers, lake and mountain, in which the artist has etherialized nature. It is a book to dream over, and every one is justified in going into ecstacies over a book. Miss Jerome has given us full reason for so doing as we gaze on these gems of nature and of art."—Golden Rule.

LEE AND SHEPARD'S ILLUSTRATED SOUVENIRS.

HYMNS, BALLADS, POEMS and SONGS.

In novel and attractive styles, comprising sixteen favorites, illustrated by our best artists.

ABIDE WITH ME.

LEE AND SHEPARD, PUBLISHERS, BOSTON.

THE NEW YORK TRIBUNE FOR 1887.

Best Weekly Paper in America regardless of Politics.
PROTECTION, EQUAL RIGHTS, TEMPERANCE.

Weekly, $1 a year.
Semi-Weekly, $2 a year.
Daily, $8.50 a year.
Sunday Tribune only, $1.50 a year.

The campaign just closed found the country in the trough of the political waves. The Republican managers have made the best struggle they could against a state of general apathy. In a few States they have been aided by the inspiring presence of a great leader, whose speeches have awakened almost the only enthusiasm anywhere shown. The result of the campaign is gratifying: its gains are an inspiration: and the Democratic losses are a plain guide to the popular drift. From this time forward the country will feel the lift of the advancing wave of 1888, which, if we all do our duty will sweep out from Washington the masqueraders now in possession, the foes of protection, equally and patriotic government. It is now the duty of all earnest and experienced workers to bend their energies toward united and hearty work for 1888. The party is to be consolidated, cheered, and rallied. To this work THE TRIBUNE pledges its zealous efforts.

THE TRIBUNE will supply all agents and committees with specimen copies; and other sample copies will be sent to all lists of names which are furnished. THE TRIBUNE invites correspondence from committees as to rates for the coming year.

THE TRIBUNE BOOK OF OPEN AIR SPORTS.

THE NEW-YORK TRIBUNE has compiled this splendid premium book expressly for the young men of the United States. It is a thorough statement of the present status of Open-Air amusements in America, with suggestions to beginners, the rules of every important game, the records of noted contests and the achievements of American Champions. The book will contain about 150 illustrations. Chapters are provided on Archery; Baseball with the record of wonderful playing and of the League and Association matches, and with instructions how to curve a ball; Court Tennis, Lawn Tennis, Football, Cricket, Lacrosse, Racket, Horsemanship, Cross Country Hunting; Yachting, with a discussion of Sloop and Cutter and instructions How to Design, Build and Sail a boat; Rowing, Canoeing, Fishing, Trapping, Swimming, Hunting with Shotgun and Rifle, Camping out, Winter Sports, Bicycling, Amateur Photography and a few minor sports. Among the writer who have contributed are William Blaikie, author of "How to Get Strong"; Maurice Thompson, the archery expert; Captain Jacob A. Augur, Cavalry Instructor at West Point; David Kirby and Thomas Clapham, yacht builders; General George W. Wingate; the rifleman; Professor George Goodale, Director of Athletics of the New York Athletic Club; and a large number of private gentlemen in the South and throughout the country, who have contributed facts concerning the wild game and hunting sports of their several localities. No book of this character has ever been put into print in America. It is sufficiently elemental as to be a "Boy's Own Book" and answer all the purposes of our manly youth, and will also meet the demands of adults. Will be ready for delivery December 1st. Octavo, 500 pages. Retail price, $2.50. Terms, postage paid:

With Weekly, one year	**$ 2 50**
With Semi-Weekly, one year	**3 50**
With Club of 10 Weeklies, one year.	**11 50**
With Club of 20 Weeklies, one year	**20 00**
With Daily, one year	**10 50**

This book will be used exclusively as a premium with THE NEW-YORK TRIBUNE.

OTHER PREMIUMS.

A fine Waltham Watch; the cheaper Waterbury Watch; Webster's and Worcester's Unabridged Dictionaries; Wood's beautiful Illustrated Medicine, Hygiene and Surgery; Blunt's Rifle Practice; Ridpath's Illustrated History of the United States.

Send for Circulars and Sample copy.

THE TRIBUNE, New York.

Books For Every Family.

TEN DOLLARS ENOUGH.

By CATHERINE OWEN. 16 mo., $1.00.

A household book of remarkable value. The writer tells a pleasant story, and weaves it into recipes and excellent directions for cooking and housekeeping. The story appeared serially in *Good Housekeeping*, and has received the unqualified commendation of many who have tested the recipes and followed the suggestions.

The Madonna of the Tubs.

By ELIZABETH STUART PHELPS, author of "The Gates Ajar," "Beyond the Gates," etc. With 48 full-page and smaller illustrations, including figure, landscape, and marine subjects, by ROSS TURNER and GEORGE H. CLEMENTS. 12mo, tastefully bound, $1.50.

A touching story, admirable pictures, and tasteful mechanical execution make this a very attractive, yet yet inexpensive gift-book.

Reckonings for Every Day.

A Calendar of Thought. Arranged by LUCY LARCOM, editor of "Breathings of the Better Life" etc., $1.00. Miss Larcom has here gathered, from a very wide range of authors, passages of special value for help, suggestion, encouragement and consolation.

THE New York Times says: "The editor of the RURAL NEW-YORKER is a New Jersey farmer who has an experiment station of his own, which is not equaled in value for useful, practical results by any of the scientific stations operated by a staff of Professors at great cost."

Our regular Premium List and Posters will be sent to all applicants without charge. Specimen copies will be mailed free to any name or list of names with which our readers or agents may favor us in order to aid them in obtaining subscribers.

CORRESPONDENTS' VIEWS.

THE wagon which I received as a premium last year came to hand all right. It was so well packed that there was not a scratch on it. A wagon-maker at our place calls it the finest-finished piece of work he ever saw. The Columbus Buggy Co. write me that this wagon is not a special article, but just what they furnish to all. It is light, but strong, carrying three with ease. It is a real treat to ride in such a carriage after a day's hard work on the farm. If any reader of the RURAL wants to get a good carriage, he can't do better than to go where mine came from. Such a carriage makes fine pay for my work at canvassing.

Chenango Co., N. Y. W. S. MOORE.

I WAS glad to see the RURAL speak of Kaffir Corn. Wherever wheat and Indian corn are sure crops, these new or old sorghums will have less value or no value, but with us both Indian corn and wheat are very precarious, and the sorghums offer us certain returns in grain almost as good as Indian corn, and forage in far greater abundance. After years and years of dependence on one or another sort, I would feel as if I could ill get along without them. For ensilage, any early sort of sorghum should have a place with you.

Augusta, Ga. J. H. ALEXANDER.

THE tests for fattening cattle at the college farm at Champaign, Ill., gave some surprising results. Prof. Morrow writes that the heaviest cattle are half-blood Holsteins. The greatest weight is 1,785 pounds for a steer not 31 months old. The steer of best quality is a three-quarter Hereford. A pure-bred Ayrshire weighs 1,525 pounds at 32 months. The steer of best form is a pure-bred Shorthorn, but a local trouble has reduced his weight 200 pounds or more. This "battle of the breeds" was harmless enough. L. V. C.

GRANGES and Farmer's Clubs can help the agricultural colleges materially. The colleges need students and there are plenty of bright farm boys who need educations. Let each flourishing Grange provide for one or more scholarships at the agricultural college—that is to say, let them each lay aside at least $75 each year, to go towards paying the expenses of at least one boy from the neighborhood. Let the boys be put to some test to determine the one best qualified for the place. With $75 back of him a bright boy can easily work his way through an agricultural college and there are plenty of boys who would jump at such a chance. If the farmers of any State want to make something out of their agricultural college, let every farmers' organization pledge itself to provide at least one student. Try five years of such a policy and see what the result will be. GRADUATE.

WHEN I first started reading the RURAL NEW-YORKER three years ago, I could hardly interest myself in the contents, but now I welcome it eagerly, and can hardly wait until evening to scan its well-filled pages of sound, wholesome reading. I used to think, too, that you were fearfully one-sided and partial; but after getting acquainted with your ways and views, I am convinced that you do sometimes speak the truth when it hurts, but for a good purpose and in the best of spirit, for the good of all. I well know that agricultural editors, like all others, must educate their readers to their particular duty, and practice as they profess, or accomplish nothing.

Dayton, Ohio. WILLIAM BARRINGER.

I FIND by experience that the way to grow the best crop of potatoes at the least cost of labor, is to plow in November the ground that is to be planted the next Spring. After plowing, manure broadcast with 12 three-horse cart loads of barn-yard manure to the acre. Let it be until Spring without harrowing. The action of the weather will completely pulverize the ground. In the Spring the weed seeds will sprout early and grow vigorously. When in the seed leaf, put the harrow on, giving the ground a rough harrowing, destroying them with ease and dispatch, and at the same time leveling the ground.

Chester Co., Pa. CHARLES C. MOORE.

ON a space of my strawberry bed one-half rod wide by one rod long I picked 90 quarts of berries. It was a fair average of the whole. Who beats that? The plants were Crescents, a trifle over a year old. They were in matted rows 3½ feet apart. The field was a sandy loam. It had a fair dressing of stable manure, and I applied to the plants a little "patent medicine," as I call commercial fertilizer. N. C. JESSUP.

Suffolk Co., N. Y.

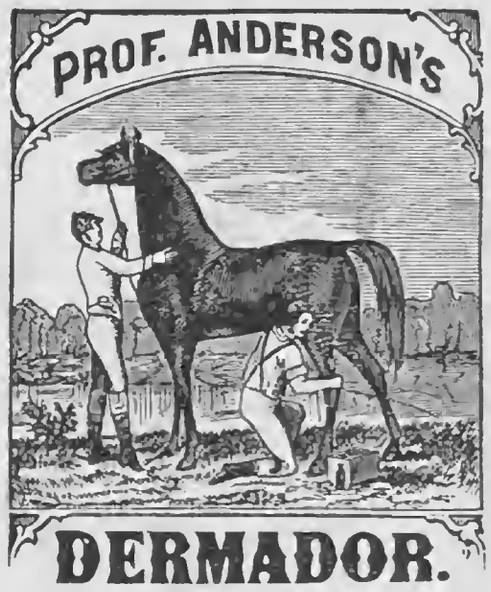
PRINCESS, the fine English hackney mare, recently died suddenly. She had been carried about from one show to another, spending most of the time, in the cars, the stall and the show ring. High feeding for months without proper exercise had made the horse "soft." Whenever turned into the pasture on returning from a show, she was so glad to be at liberty that she spent the first hour trotting at full speed up and down the pasture. This in her "show" condition, engendered a chill which resulted in inflammatiou of the lungs, and death. There are doubtless many cases where animals are killed or injured by the treatment necessary to fit them for exhibition or the result of this treatmeut. We seldom hear of such cases. It is poor policy to let the public know of them. Our horse shows are filled with fat horses. They present a fine appearance to the visitor, but their condition is unnatural. We want fat in the steer, but muscle in the horse.

THE EARLY BEAUTY SWEET POTATO I consider the most promising variety. The vines are of strong and vigorous growth. The potatoes are large in size, very round and short, and of the yam species. I think it a variety worth trial. It originated in Florida. J. S. B.

PARTICULAR
ATTENTION IS CALLED TO THE LIST OF JOURNALS WITH WHICH THE RURAL NEW-YORKER CLUBS. ANY OF OUR READERS WHO DESIRE TO SUBSCRIBE FOR ANY OF THESE PAPERS IN CONNECTION WITH THE R N.-Y. ARE PROMISED THAT THEIR COMMANDS SHALL RECEIVE CAREFUL AND PROMPT ATTENTION.

BEAR in mind that the RURAL never *sells* its premiums. We give them as payment for work. We will not, under any circumstances sell them for cash. The RURAL sells nothing and hence is not bound to praise any implement or plant except as it deserves praise.

GOOD FOR MAN AND BEAST.



DERMADOR.

GOOD FOR MAN.

Inflammation of all kinds. Diptheria, Wounds, Bruises, Burns, Sprains, Rheumatism, Sore Throat, Swelling of the Glands, Inflammation of the Eyes Broken Breasts, Frost Bites, Chilblains, Piles. Bee Stings and all sores.

Have you seen it lately?
Seed-Time and Harvest
Is an Illustrated Monthly Rural Magazine whose mission is to bring PLEASURE and PROFIT to our American Country Homes. So bright and progressive a Magazine ought to have a million readers, and no doubt it would have if they only knew how easily
SUCH A GEM
can be procured. It really gives monthly
A TREAT
of the most instructive and interesting matter to be found in any periodical published anywhere. Each number is divided into the following departments:
OUR SCRAP-BOOK:
In this is given very choice selections in verse worthy of preservation either for their elocutionary or true poetic merit or oddity. Poetic gems rescued from the literary high seas.
PROHIBITION:
The influence which will quietly be exerted by the monthly visits of this in any family in which boys are growing up may be of incalculable value in helping to mould their characters for all time.
GARDENING:
This magazine was originally devoted to market gardening and will continue to pay special attention to this great industry, giving notes and illustrations of new vegetables and improved ways of cultivation, crop reports, &c.
THE FRUIT GARDEN
will be treated in a like manner, giving essays written by the eminent Fruit Growers of the day, also notes and illustrations of new Fruits. *Pleasure and Profit.*
FLORAL
Notes will continue to be a strong and pleasing feature. Then there is "Aunt Martha's" HOUSEHOLD, and the CARP POND, POULTRY and PET STOCK, and the PUZZLE DEPARTMENT which gives prizes each month to the best solvers. Although our subscribers say that single numbers are worth a dollar our price is but
Fifty Cents a Whole Year
Or to introduce it we will send it for
three months for one dime!
We give club-getters very liberal commissions, and as an additional stimulant shall on the first of April next pay $100.00 in Cash to the one who shall have sent the largest list of subscribers.
GREAT OFFER

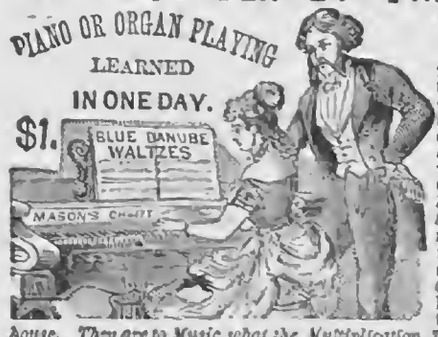
THE WONDER OF THE AGE! A SCIENTIFIC TRIUMPH!!
MASON'S INDICATOR CHART, Attachable to any Piano.
A child 10 years old can understand it perfectly.



This wonderful invention has been before the public (in its perfected form) less than two years, and we have sold over 40,000, which is the surest test of its merit; and orders have been received from every country on the globe. **Mason's Indicator Chart is a machine** which fits over the keys of a Piano or Organ, *indicating where and how the hands are to be placed, and the proper keys to strike*, changing its position and arrangement to suit the different keys. *They are infallible in result.* If you can read you can play the Piano or Organ in **one day** *better than a Teacher could teach you in many lessons.* If you have no Piano you can learn at some friend's house, and astonish all with your acquirement. DEXTER SMITH, the editor of the leading Musical Paper in the world, says, "*They should find a place in every house. They are to Music what the Multiplication Table is to Arithmetic.*" It gives satisfaction in every case. MUSIC TEACHERS UNRESITATINGLY ENDORSE IT. The price is **$1.00** for a complete set (4 charts). Favorable terms to Agents and the Trade.

$1.75 WORTH of Choice Music Given FREE.

SPECIAL OFFER.—In order to introduce this wonderful invention at once in every town where this paper reaches, **we will give free** to every reader of this paper, who buys a Mason's Indicator Chart, our **Musical Album**, containing music which if bought separately would cost **$1.75.** If you desire the Album, STATE THAT YOU SAW THE ADVERTISEMENT IN THIS PAPER, otherwise we will **not** give the Album free, as it is intended as a present **solely to the readers of this paper.** We send the Indicator and Album by mail, **prepaid**, for **$1.00.** THIS IS POSITIVELY NO HUMBUG. We have thousands of testimonials from old and young, and from almost every country on the globe. C. H. W. BATES & CO., Ag'ts
106 Sudbury St., Boston, Mass., Sole Agents. *These Charts are copyrighted and patented. All infringements will be prosecuted.*

THE ESTIMATION IN WHICH THE RURAL NEW-YORKER IS HELD.

I am much pleased with the R. N.-Y, Its special numbers and reports upon fruits—especially small fruits, in the cultivation of which I am engaged for market, give your paper value with me. R. M. WELLES.
Towanda, Pa.

I have taken the RURAL 15 years, and shall continue to take it as long as I can raise two dollars. I am taking two other agricultural papers, and I like the RURAL the best. Shall continue to speak a good word for it, and am in hopes to get some to subscribe.
Hudson, Ohio. E. A. SEASON.

Wishing a good farm journal I have sent for a good many sample copies of different ones, among the rest the RURAL NEW-YORKER, and after examining them all thoroughly, I find your paper stands head and shoulders above the rest, and I work on the maxim—"Try all things and hold fast that which is good." Please put my name down for the RURAL. F. H. BATES.
Dudley, Wis.

I like the RURAL better each year. I take it because it gets right down to hard-pan, and tells what practical men are doing, and how they are doing it, instead of indulging in fine-spun theories of some dreamer, who never did a hard day's work on a farm in his life.
Whitewater, Wis. JAY D. STANNARD.

At the annual meeting of the Kentucky Horticultural Society in Glasgow, Ky., on the 2d, 3d and 4th of December, 1885, the subject of horticultural literature was presented in a paper read by J. B. Nall, editor of the Farmers' Home Journal, and the following discussion was had:

A. D. Webb, of Warren County: "I take probably a half dozen papers, and consider them all good. The RURAL NEW-YORKER is a good paper."

Judge Dulaney, of Warren: "I think the RURAL NEW-YORKER is by far the best horticultural paper I take, and I take a dozen."

I can truly say I would much rather live on one meal a day less through the Winter than give up the RURAL. This may be thought untrue by some, but it is true.

I can truly say that if the RURAL cost double its present price I would not deprive myself of its weekly visits—to say nothing of its valuable Seed Distribution. You are doing a grand and noble work and I sincerely hope your life will be spared to make the RURAL all that it can be.
Portage Co., Wis. REV. CHARLES SMITH.

We have taken your excellent paper many years, and although we take a good many other papers, we cannot give up the good old RURAL, and want to increase its circulation.
Orient, L. I. A. J. BEEBE.

In my estimation the R. N.-Y., stands at the head of the list of Agricultural papers of the country and is deserving of the widest circulation.
Moorton, Del. R. M. COOPER.

Believing it would be a great National benefit if you could double your list for the year 1886, I wish you the largest success.
Canon City, Col. REV. L. J. TEMPLIN.

The premium spoons came to hand all right yesterday, and in good order. They look very nicely. Many thanks to the RURAL for so fine a present for so little work, and my prayer is that the RURAL may go on to perfection, exposing all of the frauds that may come in its line of advertising. Yours respectfully.
Binghamton, N. Y. E. POTTER.

Many thanks for free seeds received. They are worth the $2. I cannot give vent to my feelings of respect, and thankfulness for the reliability and general superiority of the RURAL New-Yorker. Hoping you will always be as original and impartial in your publication, I remain. F. W. WILSON.
Chatham, Canada.

I wish to add my mite of appreciation to the sterling worth of the RURAL. It is a common sense, able, scientific exponent of advanced agricultural thought and progress. Its influence and teachings must make every individual reader a more thorough, painstaking and *business-like* farmer, and its value as such a teacher is but poorly expressed by its extremely low price of subscription. I am a RURAL subscriber, and shall continue to be as long as I can appreciate a *good investment*.
Troy, N. Y. MARVIN E. STOW.

It affords me great pleasure to read the R. N.-Y. Some things that it contains, it is true, attract my attention more than others because I am more especially interested in them. The various topics of agriculture are treated in a plain and practical manner. The methods suggested are in the main suitable for the farmer. The brief explanations and kind criticisms by the editors, inserted when necessary in the various themes pertaining to agriculture by your intelligent writers, correct many misleading statements and prevent, no doubt, numbers from engaging in unwarrantable experiments, where money, time and labor would be lost. The terse and direct answers to inquiries in the "Farmers' Club" give much valuable information in a condensed form. The exposure of swindlers, frauds and fraudulent concerns in the "Eye Opener" forewarns the reader if he but heed the advice. In the "Women's" and "Domestic Economy Departments" there are many important things. The editorials, the summary of the home and foreign crop reports, the markets, and home, foreign and agricultural news are of special interest. All efforts to secure the latest and most reliable crop reports, both at home and abroad, so as to be able to prognosticate with some certainty in regard to future prospects, are highly appreciated by the farming community. Your positive, clear, concise and conservative views in dealing with subjects of general interest, as well as your earnest endeavors to elevate and ennoble agricultural pursuits, are highly commendable. SAMUEL G. ENCKE.
Albion, Mich.

I do honestly believe the RURAL NEW-YORKER to be the best agricultural paper in the world. There is nothing I can say against it, but a great deal that I can say for it.
LEWIS B. AVERY.
Lenawee Co., Mich.

Your old friends are not going to leave you. For me to know you once is to keep up that acquaintance for life. You come so near my ideal of the right man in the right place, that it would take more than $2.00 a year to drive me off. You are enthusiastic in the dissemination of new fruits, which pleases me, and yet so careful not to commend until you have proof, that I am saved from disappointment and expense. I have always believed a straight honest course in business of any kind would bring lasting success.
Leavenworth, Kansas. C. W. KEIFER.

I am very well pleased with the RURAL although I differ with some of the writers and correspondents and sometimes with the editorials, yet I consider it honest in its suggestions, practical in its views and fearless in its editorials and a paper that does not try to please everybody. It is just the paper that the practical and experienced farmer or fruit grower wants and those just beginning cannot afford to be without it. Having nothing to sell and no humbugs to impose upon people it fearlessly exposes frauds and aims to keep the eyes of the people open. L. M. LOOPE.
Cortlandt, N. Y.

We think the RURAL the best agricultural journal published and would not try to farm without it. Yours Respectfully,
Parsons, Kansas. M. WALKER.

As long as the RURAL continues as good as it now is you may be sure of our continued support. It undoubtedly takes the lead of all the agricultural papers I have seen.
W. A. BISHOP.

Father died on the 20th of December after a lingering illness, but he told me before he died not to give up the RURAL. So you will find enclosed $2.00 for renewal for another year.
Nanticoke, Ont. JOHN LINDSAY.

I regard your paper as one of the best two, if not the best, weekly published and you will find, that I not only renewed my subscription but sent three new ones.
Boston, Mass. C. B. FAXON.

There is not a paper in this Country that fills the bill in every respect (to my notion of a paper) like the RURAL NEW-YORKER. I have taken it at different times ever since it was published by D. D. T. Moore at Rochester and I think there is a steady change for the better every year. God bless the old RURAL and long may it live to make the life of the farmer brighter.
Oakland, Mich. D. P. TUCKER.

Miscellaneous.

CALIFORNIA NOTES.

Differences in growth of fruit trees in the East and California; yield of vineyards; abundance and prices of grapes; favorite varieties; peaches; potatoes, hops and other crops; benefits of railroad competition; rainfall in Sonoma County; Mary Wager-Fisher's sketches; climate and products of Northern California.

YOUR Old World ways are not our ways. Even Nature strives to outdo herself in California. The thought is suggested by looking over the report of a meeting of fruit growers recently published in the RURAL NEW-YORKER. One of the members, a noted horticulturist of Rochester said that the annual growth of wood on his pear trees was about two feet, which, perhaps, may be called a good average. Now, look on that picture and then on this. From one graft put in by the writer the last day of April, the present year, which was not as thick as a lead pencil, there have grown branches from three buds, just measured and yet growing, one four feet six inches long; one four feet seven inches, and another five feet two inches. I have grown the French prune on almond, 12 feet in one season, with lateral branches in addition. Most fruit trees make the enormous growth above noted under favorable conditions.

An acre of vines eight feet apart numbers 680. The product this year for ten-year-old vines, on the best land, well tilled, with careful pruning, is often 50 pounds each. The crop of Missions on the vineyard of Mr. J. Hessions, near Santa Rosa, is referred to; but the yield is exceptional, for, like farming the world over, there are lazy and heedless owners who do not average over half a crop. The Rose of Peru is a magnificent grape. Mr. G. H. Cornelius, of Sonoma, exhibits a bunch weighing 16 pounds. Plenty of other sorts—Muscat, Flame Tokay and the like—weigh from five to 10 pounds per bunch. Our best grapes do not bear transportation, and are never seen in the Atlantic States outside of conservatories. Though our valley is studded with wineries, there is scarcity of cooperage to hold the wine, and it is feared that many tons of grapes will rot on the vines for lack of a market. They are selling for from $10 to $18 per ton delivered—Missions being the cheapest. One of the cellars crushes 90 tons daily from wagons which wait patiently for their turn to unload, like hauling corn to the railroad depot in an Illinois prairie town. Muscats, Black Morocco and others bear berries an inch in diameter, each being a good mouthful of delicious eating.

To-day there have been touches of white frost in exposed places. The leaves on vines and maples are turning, and the woods and vineyards are aflame with red and purple colors. The first rain of the season, after more than five months of dry weather, has laid the dust and rendered out-door life more endurable.

Just now the late sorts of peaches, such as Smock and Salway, are in perfection. I often wonder why more are not grown. They are of good size and quality, and marketable at about twice the price paid for early fruit. Trees of the peach, apricot and nectarine are subject, as elsewhere, to diseases, exuding gum, with the annual loss of many branches. We find it best to head back, so as to keep the reproduced boughs near the trunk.

So far as our observation extends, the Burbank Seedling is the best potato here. Other localities may have better. The crop is light this year. Hops were a full yield and very profitable. Owing to the unusual rainfall of the past season, California raised bonanza crops, so that farmers and all others are experiencing unusual prosperity. People abroad, who only think of this State as a producer of the precious metals, will be astonished to learn that the yield of the gold and silver mines, say $25,000,000 yearly, is hardly a drop in the basket as compared with the proceeds of our other industries. The wheat and barley harvests alone were in the neighborhood of 100,000,000 bushels. The crops of raisins, wine, hops, fruit, lumber and dairy products are immense; while far overshadowing either one enumerated was the luxuriant yield of grass, of more intrinsic value than any when we consider the question of cheap food.

Competition has worked a revolution in the scandalous rates of freight long prevailing from Eastern points. It used to cost five cents a pound for stuff from Chicago to San Francisco, now the rate is about 25 cents per 100 pounds.

Those who read for amusement as well as for information sometimes like cold facts. The writer keeps a rain gauge, and gives the following statistics of the rainfall at Cloverdale, 80 miles north of San Francisco, at a point where there never is snow and seldom frost, and oranges, olives, and like tropical fruits are grown in perfection. For "the season" means beginning with the fall rains and extending to their close, about the first of the following May. During that time all the outdoor pursuits of a farmer's life are carried on almost without interruption; for it does not rain continuously more than in the Middle States. True, sometimes, but not often, there are two or three days of bad weather. Then, again, it may not happen during a whole season that plowing must be stopped more than one day.

Rainfall for Season of			1882-3.....	27.38 inches.
"	"	"	" 1883-4.....	28.77 "
"	"	"	" 1884-5.....	21.26 "
"	"	"	" 1885-6.....	46.65 "
Average yearly rainfall.....				31.01 inches.

which is about the same as at Santa Rosa, Healdsburg, and Napa. The temperature I do not give, as it varies little. The barometer we have no use for. It never rains in Summer, nor does it thunder or storm at any time.

The sketches of your fair correspondent, Mary Wager-Fisher, were fairly drawn and attractive. She is an artist of no mean ability, and knows what objects to place in the foreground. California as it is, if faithfully reproduced by the observer, presents many attractive scenes. But vine growing never, by any chance, yields $500 an acre profit. Somebody has imposed upon her credulity. The average product of grapes per acre, throughout, will not justify a higher estimate, one year with another, than $100 per acre. On account of the low prices of grapes this year, the average profit will be much less. But this is far more profitable than other kinds of husbandry. There are isolated cases, to be sure, in which this estimate is exceeded, as there are others in which it is too high. The equable climate within 100 miles of this coast, Summer and Winter, is the one thing which may be honestly recommended. It is the principal attraction—the solid basis of our prosperity. But an erroneous impression has gone abroad that the country north of the Bay of San Francisco is cold and inhospitable—wrapped in snow storms and wintry frosts. It is not so. There is no appreciable difference between the climate of Sonoma and Los Angelos Counties, owing to the influence of the Japan current, which tempers both. We also grow oranges, olives, figs, peaches, and in wine this is the second county in the State. The citrus show, held at Sacramento, last January, proved that Sonoma was not behind any other place in the variety and quality of her fruits. We certainly offer much cheaper land, and it does not require irrigation.

Cloverdale, Cal. J. B. ARMSTRONG.

THE Bohemian Grain and Cereal Company, of Ypsilanti, Michigan, has been operating quite extensively in Michigan, Western New York and other places in grain swindles, and its agent has just got into trouble in Rochester, New York. Like the other similar swindling schemes which have been fleecing the farmers for years, it sold wheat at $10 per bushel. As an inducement the company gave a bond to the purchaser in which they agreed to sell for him the following year double the quantity he bought, at the same price. Last year W. H. Clark, a wealthy farmer of Groveland, Mich., bought a large quantity of wheat on these terms. The company's agent called on him a month ago and sold the wheat to farmers on the same terms, retaining 33⅓ per cent. for his share of the profits and giving Clark notes for the balance. These proved worthless, and Clark followed the agent to Rochester, and intends to prosecute him criminally for swindling. Probably there is no other single species of fraud by which farmers have lost so heavily within the last few years as they have by these grain speculating concerns. They are managed in a very plausible way, and men of means and reputation have figured prominently in them; but they have, without an exception, lost in reputation in proportion as they have gained in means by their connection with the swindles. The Bohemian oats and several similar frauds entered largely into Ohio politics during the late election. Generals Robinson and Kennedy, on the Republican ticket, were accused of being interested in the schemes, and had they not indignantly denounced the charge and proved their innocence they would have been buried beneath a mountain of hostile votes. No man desirous of public confidence or of a reputation for common honesty should have any sort of connection with these swindling concerns.

CATALOGUES, ETC., RECEIVED.

A. W. STEVENS & SON, AUBURN, N. Y.—An illustrated circular of Stevens's French buhr-stone, corn and feed mill. This circular gives a full description of the goods made by this old established house, and in a straightforward manner, the reasons why they claim buhr-stone mills are the best and cheapest in the long run. They also make mills with bolting attachments for making marketable meal, a large-sized corn-sheller, engines and thrashers. An illustrated descriptive circular will be sent to all RURAL readers on application.

KELLOGG'S ROYAL SALT.—We have spoken of this preservative several times, but the more carefully we examine it the better are we satisfied as to its good qualities. We have made several tests with it in our own dairy, and in every instance it has done all that was claimed for it. Butter preserved with it is certainly superior to that kept for the same length of time with common salt. The action of this preservative is a chemical one. It arrests rancidity, and is, so far as we can judge, harmless to health. It seems probable that this salt will prove of great benefit to Southern dairymen. Dairying at the South is rapidly developing. Heretofore the greatest drawback has been found in the difficulty in securing a temperature low enough to keep the butter properly. Either ice must be imported or manufactured at a great expense, or deep caverns must be dug into the earth for storage rooms. This butter preservative promises to lessen the expense of storage for Southern dairymen. Experiments have fully proved its ability to preserve butter under the most trying circumstances. Southern dairymen will do well to give this preservative a fair trial. The office of the company is at 384 West Eleventh Street, New York.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

A THANKSGIVING.

LORD, Thou hast given me a cell,
Wherein to dwell;
A little house whose humble roof
Is weather-proof;
Under the sparres of which I lie,
Both soft and drie;
Where Thou, my chamber for to ward,
Hath set a guard
Of harmless thoughts, to watch and keep
Me while I sleep.
Low is my porch, as is my fate,
Both void of state;
And yet the threshold of my doore
Is worn by the poore,
Who thither come and freely get
Good words or meat.
Like as my parlour, so my hall
And kitchen's small;
A little butterie and therein
A little byn,
Which keeps my little loafe of bread
Unchipt, unflead;
Some little sticks of thorne or brier
Make me a fire,
Close by whose vir coals I sit,
And glow like it.
* * * *
All, these and better, Thou dost send
Me, to this end,
That I should render, for my part,
A thankfull heart;
Which fired with incense I resigne,
As wholly Thine;
But the acceptance, that must be,
My Christ, by Thee.

Robert Herrick, 1674.

THE COMPLIMENTS OF THE SEASON.

WHEN those Pilgrim Fathers, whom we love to honor, decided, in their stern piety, that Christmastide was a Romish superstition, if not a relic of heathenesse, they only carried out the spirit of rigorous religion, which was the very bone and marrow of the struggling colony. But Puritan nature is human nature after all, and in default of pagan's Saturnalia or churchman's Holy Nativity, they made a new feast of good will to men—Thanksgiving Day.

We always felt a warm pity for the children of Pilgrim Fathers. Poor little square-toed victims, they never hung up their sad-colored hose in the ingle nook; they were totally unacquainted with Santa Claus, and careless of the red-berried holly, while mention of the mystic virtues possessed by the sleek mistletoe would have caused a thrill of horror in that pious community.

But once a year, let us hope, the stern elders unbent; once a year the little victims were allowed to forget the whole duty of man, and after a decorous public thanksgiving in the bare meeting-house, there was the feasting and gayety we always connect with the season. So, with many another legacy, the old Puritans have left us this—our oldest national holiday. It is—it should be—the happiest of holidays, for Christmastide is a solemn gladness, out of tune with careless merriment. Mayhap we feel as if we had not very much to give thanks for;—our pet plans have miscarried, or our worldly affairs are unprosperous; perhaps some heavy grief or loss makes the thought of thankfulness harsh and discordant. But there must ever be some cause for thanksgiving, "for our creation, preservation, and all the blessings of this life," as the church liturgy says.

Yes, the occasion is a happy one, but with a slight touch of solemnity, as befitting the balancing of our mental and moral accounts So, with the hope that the Thanksgiving side will weigh the heavier, inasmuch as we all alike find cause for gratitude, we end, like Dickens's Tiny Tim, "God bless us, every one."

THREE THANKSGIVING DAYS—THE STORY OF A SPRING FRESHET.

THE PROFESSOR.

"To be sure I'm goin' up to 'Hampshire for Thanksgivin'. You folks down here to York are mighty clever 'n all that sort o' thing, but horses couldn't keep me away from home on Thanksgivin' Day;" and so saying Aunt Tildy Jenks adjusted her spectacles, settled the strings of her cap and folded her hands in her lap.

"No! no! There's not been that day in any year, for now nigh onto sixty when the Randses and our side of the Doolittles hasn't all met and dined; though let me tell you they make a crush in the biggest house in the Mosquasset Valley. Three of what the literary writers call eventful and providential anniversaries to me fell one arter another in '27, '28 and '29, and they will be celebrated as long as our folks continner to exist around New England."

"The Mosquasset River has got a modern name in the geographies now-a-days, but I don't mind that, for I like the old names and the old times best, and I do wonder why these legislater chaps, with all their innervations,

don't change the name of the Merrimac, into which the Mosquasset falls. It was aloug in the twenties when Sam Rand, old Bijah Rand's oldest boy, was about twenty-three years old. But maybe you'd rather go shoppin', now you've all got your good clothes on, than hear me yarn about somethin' you ain't so much consarned in as I am."

"We will none of us move, Aunt Tildy," was the almost simultaneous reply of the girls, "until we've heard the story."

"Well, well, if so I'll go on, for I'd jest as soon be talkin' as rockin' or knittin', all alone. As I was sayin', plain Sam Raud was about twenty-three, and he was powerful in love with Samanthy Doolittle, who was only a year or two younger, an' the prettiest girl in the valley. Sam an' Manthy had allus been friendly an' intimate an' allus called one another 'cousin,' 'coz old Bijah Rand had married Manthy's aunt Mercy, for his second wife an' Sam an' Manthy wa'n't no blood relations at all. But for all Sam's goodness Manthy didn't seem ever to fancy him in the marryin' way; an' when Markis Rellins Pugsley come home from college an' studyin' law to stay a spell 'fore he set up an office in Manch'ster, an' bein' a real good-lookin' feller with no end of smooth talk, he just walked into Manthy's affections, an' the first thing the town knowed they was engaged to be married."

"The Doolittles was delighted, for old man Pugsley was a member of the legislater an' great things was prophesied of Mark. An' I guess the Pugsleys wa'n't much put out, for Manthy's father was the richest man in the valley, kept store, was postmaster, an' had a mortgage on the Pugsley farm itself."

"So things run on an' Sam never let on that anythin' was the matter with him, for he was allowed to be the pluckiest an' best-hearted young feller in them parts. But he took it to heart an' grew quiet-like, an' worked eighteen hours a day to engage his attention an' keep hisself from broodin'. Well, the weddin' day was set for sometime in May '24, an', in early April, Mark Pugsley come over from Manch'ster, to do his final courtin' an' get things proper for marryin'."

"Manthy had been over to Jenksville, that was named for my dead husband's grandfather, on the northside of the Mosquasset, to take her girl's leave of some cousins an' schoolmates, an' was expected home on the follenin' Sunday. The river was runnin' pretty high with the Spring freshet, but nothin' more'n usual was thought about it till Sunday mornin' when the banks was dreadful full an' some ice comin' down, and the ricketty old bridge below the mill was sufferin' from the shocks, an' Sam Raud suggested some one should go over an' stop teams comin' across into the village, though two or three early teams had already crossed to church. But nobody caught the idea that Sam was afraid of Manthy's comin' an bein' in danger on the old bridge. As for Sam he thought some one else should do the lookin' out for Manthy, an' reckoned it would be counted interferin' if he went over, an' so he went to church. The minister was just givin' out the last hymn, and the people all on 'em ready for their dinners when Abram Stickney's boy ran in an' shouted, 'The old bridge's gone an' Bill Doolittle an' his sister's drowned.' That last hymn was never sung."

"In less'n two miuntes the hull congregation was on the river bank, an' the situation of affairs was thrillin.' Down stream about a hundred yards was a rock about as big as a house, flat, an' ordinarily about six feet out of water, but now not more'n two. Agin' it was the wagon an' the two hosses, but slowly edgin' around to foller the current. Young Doolittle had crawled onto the rock, an' was tryin' to pull up Manthy, a good lump of a girl, from the bottom of the wagon, in front of the seat, where she had fainted. But it could easily be seen it wa'n't no use of his strivin'."

"Mark Pugsley allers let on that he was the best swimmer an' runner an' ball-player in the valley, havin' as he said, been boss of the college in them departments of larnin' but they didn't seem to hold him in stead that Sunday mornin', for he stood shiverin' an' blubberin' on the bank, implorin' some one to save his Manthy. It takes times like that to show what's in a man. Sam Rand didn't say a word to nobody, but jest quietly run up the bank a hundred steps or so, an' throwed off his coat an' vest an' hat, an' jerked off his boots, and slipped into the water. It was a tough work, but Sam Rand was a strong an' hardy young feller, an' his heart an' muscles was both at work on that occasion. He swum eatin' across the stream, sometimes swirled around by the current an' sometimes swept down by a chunk of ice, but though in deadly peril, his curly head an' broad shoulders would lift above the water agin, and the folks on the shore, some shouted an' some prayed as they saw him grasp the tailboard of the wagon an' pull himself in. The hosses were out in the stream an' the wagon just tremblin' on the extreme corner when Sam raised Manthy, throwed her over one shoulder an' slipped out on the inshore side, jest as the wagon an' team fetched loose from the rock an' disappeared. It was 10 good minutes, though it seemed an hour, afore a thousand willin' hands, at the point on the turn of the river about 60 rods below, was reached out to take the two chilled and drippin' bein's to land. Without sayin' a word, Sam started on a run agin' up the bank, refusin' the proffered hands of everybody till he came to where he had first gone into the water, where stood his good old father with a tearful eye an' outstretched arms."

"Manthy had come to, an' was cryin' in the embrace of her mother an' sisters, when Mark Pugsley came up, smilin' as wide as a bullfrog takin' in a fly. 'Thank God,' he says, 'you are saved, my Manthy.' An' he offered to take her away from her mother, But old Mr. Doolittle's blood was up, an' he stepped between em, with an ugly look on his not over handsome face, an' he says, 'Not so fast, Mr. Pugsley; things has taken a different turn, an'if we can't do Manthy's pettin' and carin' for hereafter we'll send for the man that has the next best right to us,' he says.

"Bijah Rand wan't a drinkin' man, but when he saw Sam go into the ice-cold water he was jest thoughtful enough to step right across the road to Bill Weymiss' tavern an fetched out a bottle of licker without sayin' a word or offerin' pay; an' when Sam had come back, as the old man knew he would, to where his clothes was, the bottle was pinted right at him. He didn't offer to take it. 'No father,' he says, 'the boy is on the rock, an' it'll be under water in less'n fifteen minutes, an' I won't take any of that stuff till I've brought him ashore.'"

"That startled his father. 'Don't you go agin', my son,' he says, his voice all broke an' husky. 'You've done your duty like a man, an' all a man could be expected to do. Take a drop of licker, pick up your clothes an' come home to your bed.'"

"Sam only shook his father's hand, pushed the proffered bottle aside, an' before the old man could stop him, was in the stream again, now runnin' harder an' faster'n ever, an' fairly ri-in' by jumps. The people held their breaths, an' stood like statures, an' ag'in a cheer went up, an' thanks to Providence, as Sam drew himself onto the rock, which was only a foot out of water, to rest a spell, an' young Doolittle was seen to put his arms about Sam's neck an' kiss his rough, brown cheek. There was mighty few dry eyes on the river bank."

"Then Sam slipped into the water, made some motions to the boy, who let go the rock an' put his hands on Sam's shoulders, an' with half-a-dozen of them brave, strong strokes they was out in the parted river an' dartin' down stream. Just as everythin' seemed to be goin' well, an' hearts on shore was beginnin' to beat ag'in, the cry came from the abutment of the ruined bridge, 'The Whitney dam has broke!' In an instant the water rose full five feet an' went roarin' along a merciless torrent. The mass of water struck Sam Rand an' he an' the boy disappeared. But only for a minnit. Up they came an' close to shore; so close that the current didn't seem to affect 'em much, when all of a sudden a great, heavy, black timber fairly leaped out of the water, an' in fallin' it carried young Doolittle down the stream, and Sam Rand, throwing up his hands, was seen no more."

"There was mournin' in that village then for a good long year. Everybody found words of praise for the brave an' hearty boy that was gone, an' the folks wouldn't let the Rand family put up a gravestone for Sam, but the public raised a big lump of money an' they erected a monument on the town square, which was inscribed to his memory an' had the motto 'May all New Hampshire's sons emmylate his example when danger lowers or humanity calls.'"

"In the Spring of '27, old Mr. and Mrs. Doolittle died, an' Manthy went over to Bijah Rand's to live, for him an' Mercy said she would in some sort take the place of the boy they had lost, it now seemed like an age ago, an' things was all settled down in the valley. There hadn't been no Thanksgivin' in the Rand family since Sam was drowned. They said they wa'n't a goin' to fly in the face of Providence, but it didn't seem, yet, as though they had anythin' to be thankful for. Mark Pugsley had soon found out how his neighbors regarded him, an' he had gone to Manch'ster, an' then to the bad through drink, an' some say disappointment. But I don't believe he ever had heart enough to be disappointed. However, in the Fall of '27, the Rands made up their minds they would have a Thanksgivin', an' all things was fitly prepared, an' when the day came round, there was about 20 collected at old Bijah's. There had been some cryin' done, as one after another dropped in, but along about three o'clock, an' it was a beautiful November day, bright an' sunshiny an' cold, the atmosphere in the house was about as clear as it was out doors, an' dinner was announced by one of the Weymiss girls, who had come in to help at table, bein' used to it in her father's tavern."

"Sally Weymiss knowed Sam Rand well, an' had had hopes, so the neighbors said, but maybe only liked him in a friendly way, an' grieved some at his loss, but bein' no relation had got over it, an' almost forgotten him, bein' engaged to a Jenks from Jenksville. Well! she said, 'diuner is ready,' and went out of the settin' room into the hall, when she screamed out, loud enough to hear over to the church and back, 'A ghost,' an' went down, bang, onto the floor in a faint. Everybody rushed out, an' then stopped rushin', for there stood Sam Rand in the open door."

"Bijah Rand was white as a sheet, but he walked out as steady as on trainin'-day an' said: 'It is my son: come back from death or still alive, here is where he belongs.'"

"'Not dead, father, but till jest six weeks ago I most wished I was,' an' then the strong men's arms were about each other, an' the sobs that rose in their breasts were not of sorrow neither. It wasn't the return of a Prodigal Son, for Sam was always a good boy and thoughtful, an', quite properly, his father's pride."

"The news spread like wild-fire, an' that evenin' they had to open the church where Sam, an' his proud old father, an' Mercy Rand an' Manthy had a regular what you call now-a-days a grand reception."

"He wasn't drowned then? Of course he wasn't, but poor young Doolittle was. The timber that killed the boy saved Sam, for as it was a passin' him, he grabbed it an' got astride a bit after it had swept around the turn, an' rode it clean down to the Merrimac River, a good 12 miles. When he was taken ashore, he started right back for home, but hadn't got more'n a mile when he thought to himself 'Well, now, I've saved Manthy for Mark Pugsley's wife, an' there's nothin' left there for me. They won't expect me to come back after bein' struck by that timber, an' 'll think me dead. They've got to mourn for me sometime, I suppose, an' it don't make much difference if they do it now, as well as then', an' so he turned his face to the southward. In the three years he was gone, he come here to York, an' bein' steady an' clever, fortune favored him; an' what with inventin' some new fixin' about a wagon, an' a way to make bone buttons, an a sellin' of a part interest, Sam was a good deal better off 'n if he had come home from his first navigatin' experience."

"As he said, about six weeks before he was down on one of the wharves when a vessel came into York from Portsmouth an' along shore, an' the first man Sam sees was Hiram Pendergrast Doolittle, mate, an' Manthy's second cousin on her father's side. They didn't chat very long afore Sam knew how the land lay up in New Hampshire an' had found out there was room in his father's house an' Manthy's heart for him."

"Of course, you know the rest. Next Thanksgivin' Day Sam and Manthy was married, an' the next I was born. Yes! I'm the oldest an' only child of Sam an' Manthy, an' seem to feel that them three Thanksgivin' Days has made a sort of claim on me to be up at the old Rand place in Mosquasset Valley on Thanksgivin' Day as long I'm alive."

SOME WAYS AND THINGS AT THE RURAL GROUNDS.

ALICE BROWN.

THE readers of the RURAL are already familiar with many things concerning this quiet country place. They know of its trees and shrubs, its flowers, and fruits, the experiments carried on within its limits, and they have read, year after year, the writings of its owner. More interesting than these because controlling and originating them, are the family, and their thought, study and work. The same questions that come to hundreds of other homes, come here to be answered, and are met fearlessly if not always successfully. Let what may of blunders and mistakes be found in a home, if it is full of affection and a spirit of earnest striving after what is noblest and best, it will be a true home.

The members of the household here are Mr. and Mrs. Carman who are already known to the RURAL readers; Cerise is the only daughter, a bright, thoughtful, blue-eyed girl, not quite thirteen. Travers is the only son, and very proud to have passed his seventh birthday, he has under his tangle of light-brown curls a mind full of awakening thoughts, and a child's eager, wondering questions.

The children study at home and are my pupils. The house is small to contain, as it does, the little school, an office for editorial work, and during the Winter the work and workers incident to the preparation of the Free Seed Distribution. There are two parlors, a hall, dining-room, kitchen and wash-room on the first floor. Three bed-rooms, the office, and a hall with a little room at each end, on the second floor. The cellar extends under the whole house. The grounds immediately around the house are about two acres in extent. In their midst is a little lake full of living springs. Around the margin of the lake are grouped and clustered trees and shrubs that droop their branches toward the water as though they love it, and in their shade grow some of the delicate native flowers and ferns.

A rowboat and a canoe float upon the surface of the lakelet and at its inlet a rustic bridge spans the water, and forms part of the carriage drive. West of the lake are the barn and poultry yards, sheltered by old apple trees, and beyond and beside them lie the vegtable garden, the grape-vines, the blackberry, raspberry, currant and gooseberry bushes and the strawberry beds. Around the house, which is east of the lake, are most of the rare trees and plants that have been selected from the thousands that during past years have been tested here. Rustic seats in shady retreats and vine-covered arbors offer pleasant resting places, but a plain, red, wooden chair and a little low bench under the Yellow-wood tree in front of the house attract Mr. and Mrs. Carman oftenest.

This is a real country home, one mile from a railroad station and post office, less than 20 miles from New York, and as free from city conventionalities as from city noise and confusion. It is not a place of summer residence and winter neglect, but a home all the year and all its members love the country and nature, in all their changes and seasons.

Having given a glimpse of the surroundings of the home and its inmates, something of its life may be interesting when Mr. Carman puts aside editorial work to talk of other subjects, and Mrs. Carman, after collecting recipes, preparing "copy," studying, attending to the little boy's wants, and setting all the household in order, finds time to entertain us with music, or to join in the walks and the games that are a part of the pleasure of country life.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

BE thankful those of you who have been spared troubles during the past year, and let those who have suffered be thankful that things were no worse.

THANKSGIVING DINNERS.

THERE is not much variety in Thanksgiving and Christmas *menus*. So long as there is an abundance of the time-honored dishes, well-cooked, both hostess and guests are satisfied. The orthodox soup is oyster, although a bisque of clams or a thin tomato soup is appropriate.

A very nice oyster soup that may be new to some of the readers of the RURAL, is made as follows: Cut the blanched parts of a bunch of celery into dice, and cook until tender, but not watery, in a pint of slightly salted water; take out the celery with a strainer, add the liquor from a quart of oysters, and skim until clear. Put in the oysters, and as soon as the beards begin to open pour into the tureen into which you have previously put a pint of boiling milk, and butter the size of an egg. The seasoning should be added just before the oysters are put in. The celery may be served with a white sauce as a vegetable.

The turkey, which "some like baked, and some like boiled," is essentially an American institution. It is one of the things that we do not owe to our "mother country." I was much amused recently at a conversation at the hotel table between an Australian Englishman and an American. The former was greatly surprised to find that Americans knew of such a dish as roast turkey, and was completely paralyzed when told by the latter that the turkey was a native of this country, and that Benjamin Franklin wanted it for the national emblem, instead of the eagle, because of its nativity.

For the highest gastronomic effects, it must be a young hen turkey, killed after a fast of 24 hours, and if the weather is cold, allowed to hang four or five days before cooking. If just before the sacrifice you give the victim a spoonful of the best vinegar, it will "die gamer," that is the meat will be whiter, tenderer and sweeter. Of course, you know how to clean and truss the bird—at least you do if you read the RURAL last November—so we will proceed at once to the dressing. To half a pound of the sweetest bread crumbs, add half a pound of boiled mashed potatoes, a quarter of a pound of the best butter, sweet marjoram, summer savory and salt, pepper and a little grated nutmeg by way of seasoning; a small portion of the best sausage meat, chopped mushrooms (if you can get them,

about a quarter of a pint can), a few boiled chestnuts reduced to a paste, and the grated rind of one lemon. The mushrooms will add a crowning and superb relish to your turkey, not to be obtained by any other means. Baste frequently while roasting and allow at least two hours for a ten-pound turkey. When it is done to an elegant brown color, place it on your largest and handsomest dish, and serve with the rich, brown gravy sauce made of the drippings.

You will have celery, the whitest and crispest, and ruby jelly, with your turkey. For vegetables you can scarcely do better than to serve mashed potatoes, also browned sweet potatoes after one of the recipes recently given in the RURAL. A chicken pie, a pair of roast partridges or a roast of beef may be placed at the other end of the table if you care for greater profusion, but you will by no means miss the pie of a Thanksgiving dinner—pumpkin. The pumpkin should be strained through a sieve or colander, and for every pint of this allow a pint of rich milk, or, better still, of cream. Five beaten eggs, cinnamon and ginger for spice, and brown sugar for sweetening. Bake in deep dishes lined with paste.

A very delicate dessert to close the dinner can be made by any one possessing an ice-cream freezer. Boil one quart of milk and stir into it a full teaspoonful of arrowroot, moistened with milk. When smooth pour it over the well-beaten yelks of six eggs, stirring hard. Add strawberry preserves, any kind of brandied fruits cut small, bits of fruit cake, sliced citron and orange peel, stoned raisins and currants. Sweeten to taste. Flavor with vanilla, freeze as ice cream. Mold in a melon-shaped mold. After turning out the pudding, spread over it the whites of the eggs whipped to a stiff froth, with a little sugar.

PALMETTO.

THANKSGIVING CRUMBS.

How long ago it seems since that first harvest of the New England colonists in 1621, when Governor Bradford instituted the first day of Thanksgiving with praise and prayer. One can well imagine the primitive manner in which it was observed, and that the vintage was of wild grapes; "white and red, very sweet and strong also," wrote J. E. Winslow in that first year. Now with the vast and varied crowd that are mingled in this wonderful America, the day seems simply a holiday—a breaking away from regular duties, and sometimes a reunion of families—and in this way it becomes sacred. How the children enjoy its appetizing odors and savory preparations. There is a flavor to Thanksgiving that no other season possesses, and it comes in the dreariest month of the year to brighten and beautify it. For the trees are bare and leafless in many parts of the country, there is snow in the air, and a prospect of gloomy, colder days. So Thanksgiving, with its cheery hospitality, is doubly welcome, and why need I tell the housekeeper how to prepare the turkey or the mince and pumpkin pies? Did she not learn it from her mother, and she from her mother away back ever so far? But the boys have been after partridges, and if by any chance another housewife has a crowd of sportsmen in her house, it may be useful to know how to cook the delicacy in various ways when the game bags are full. If baked, tie a thin slice of bacon over the breast of each bird, put them in a baking dish with a little hot water, and cover closely; cook for a quarter of an hour, then take off the cover and the bacon and put into the oven and cook "a handsome brown." Serve with currant or grape jelly. Another method is to prepare them like fried chicken, making them into the form of cutlets, and fry, after dipping them in fine cracker crumbs. These gamy little birds make a nice variety in the Thanksgiving dinner, and add flavor to it by the pride the youthful sportsmen take in being good shots, and in adding a choice morsel to the larder. And let there be plenty of fruit at this festive dinner—ripe apples and grapes are cheap and wholesome. Those who cannot grow can buy these necessary adjuncts to success, for there is less danger of hankering after forbidden fruits if the table is kept well supplied with those that grow in this wonderful country, of which all should share on Thanksgiving Day.

ANNIE L. JACK.

ONE WINTER.—II.

ANNE THRIFTY.

ONE of the boys always wiped the dishes for me while the other brought in wood and coal in the morning, and helped at the cow stable in the evening. While I put the kitchen in order and tried to answer Bertie's questions on every subject conceivable by his inquiring mind, I was turning over in my own mind what we could have for the Thanksgiving dinner, and had decided on a part of its details, when Uncle John and Sammie came in from the stable and we gathered in the sitting-room for the evening. The darning and mending usually occupied my evenings, but men and boys having no accomplishments corresponding to the needlework we must be so devoted to, uncle had a kindly fashion of entertaining us with stories of his life as a soldier in army blue, and of later experiences among the pioneers in the West. He loved his two boys with all his heart, and since their mother's death his care over them had become more tender and thoughtful, and I often thought that he felt the pinch of poverty chiefly through their wants. In every way in his power he tried to make home happy for them, and his stories were appreciated and begged for if he failed to volunteer one.

After the boys had listened breathlessly to an account of a narrow escape from flying bullets when their father was the sole target for a whole volley from the guns of the gray coats, they hurried to bed, racing to see which would be undressed first and ready to shout good-night to the other. This was a habit of theirs, and each boy kept a careful account of the number of times he beat his brother, and at the end of the week the boy who had beaten oftenest claimed the right for the coming week to sleep in the "big bed," as they called it, instead of the cot. After they were quiet I told Uncle John of my plans for the coming holiday dinner, and asked for suggestions and advice. He gave me both and a dollar besides. My ideas broadened with the extra money, and I suggested what I had not felt we could have before, namely, a few friends, just two or three to share our dinner. We were living among people who, like ourselves, found it hard to make a little go a great way, and we decided to invite a family living just around the square, consisting of a young man, his wife and mother. They had been very kind during Aunt Helen's last sickness, and Uncle John wanted to show his gratitude to them. We then discussed the dinner in all its details.

The best dishes, silver knives and forks, large tablecloth and dinner napkins, that had been packed away for months, were to be brought out and two leaves added to the extension table.

Part of the dollar should go for a small fresh ham to be roasted in my best style, and its tender white meat should take the place of turkey. Uncle John advised buying the bread, and doubting my skill in that line I accepted his advice. I wanted cranberries, but they were high and scarce that Winter, so I did not mention my wish, for I had decided to make some sauce from tart apples and give it a holiday air by rubbing it through the colander and sprinkling over it five cents' worth of round, red candies. The potatoes should be mashed, put into the vegetable dish and browned in the oven. A dish of squash and one of tomatoes should be seasoned to perfection, and to end the dinner a pan of apple-dumplings to be eaten with cream and sugar should make the happiness of the boys complete; for they thought apple dumplings "the best things Cousin Anne ever made." Apples were cheap, and having our own milk we could have the luxury of real cream for this occasion. As I made butter from our one cow, after using part of the new milk for the breakfasts, we could not have cream every day. Having planned the dinner so it might be an unusual treat for the children, my thoughts turned to our guests and plans for their entertainment during the afternoon. I was not used to entertaining and fell asleep with a troubled vision of myself vainly attempting to make our guests enjoy themselves.

OUR THANKSGIVING PIE AND OTHER THINGS.

IN making my pie I am very much like Aunt Chloe, I just put the "gregenses" together and stir it a little; but I will try this once to give you the recipe, as you have asked for it. First you must have good ripe pumpkins, well stewed, and rubbed through a wire sieve. Take one cupful of pumpkin, one-and-a-half cup of rich milk, one egg, and sugar to suit the taste; spice with ginger or cinnamon. When ready for the oven, put small lumps of butter over the top; bake well. Never hurry a pumpkin pie out of the oven, but let the crust bake well through. If you have plenty of eggs, use two instead of one, and less pumpkin, and the flavor will be more delicate. Such a pie as this will grace our Thanksgiving feast this year. In planning the dinner for that day most people think of the turkey first, but I say first be sure of the very best bread and the sweetest butter.

Our dinner will be plain this year. I shall have one of my own turkeys that will weigh about 15 pounds, sweet potatoes, boiled 20 minutes, then baked to a light brown; white potatoes boiled and mashed and seasoned with butter and cream, then beaten with a spoon until light; turnips boiled, mashed and seasoned with butter, pepper and salt; pumpkin and mince pies, plum sauce, hot slaw, celery and cucumber pickles. We will eat this dinner not later than 12 o'clock, laugh and talk while we eat it, to aid digestion, and after dinner have a candy pulling, in which young and old will join.

MRS. WALDO F. BROWN.

Do you sift your coal ashes? It pays.

By thankfully accepting the half loaf we may one day possess the whole.

Another way to economize in light is to keep the lamps in perfect order. Empty out the oil and wash the inside of the lamps occasionally; wash the wicks when they become clogged with sediment or use new ones; trim the wicks evenly; boil the burners in soda water every two or three weeks; keep the chimneys clear; have a stated time for cleaning the lamps and don't spill the kerosene.

THANKSGIVING RECIPES.

CHICKEN PIE.

Joint and boil two chickens in salted water just enough to cover them, till they are nearly done. Line a good-sized earthern or tin pan with crust, put in the chicken, adding thin slices of broiled salt pork, say one-half pound of it; season it well, dredge in a little flour, add enough of the liquor it was boiled in to fill the dish. Cover with quite a thick crust, pinch down the sides well, cut a slit in the middle of the top crust and bake nearly an hour in a good oven.

PUMPKIN PIE.

STEW your pumpkin the day before you wish to make your pies. Peel and cut it up just after breakfast. To a good-sized pumpkin put a small cup of water in your kettle before putting in the pumpkin. Let it cook slowly at first, and you will find it watery enough, then cook faster, stirring often, and boil it down until it is very thick and rich. If cooked in iron or tin (I always stew it in a porcelain kettle) turn it into an earthen dish to cool. Strain through a colander and proceed according to the directions found below.

Many only boil the pumpkin like potatoes, and skim out of the water, and mash, but pies made thus never taste as nice as when the pumpkin is well stewed down and the juices preserved. To one quart of strained pumpkin add three quarts of rich milk, one teaspoonful of salt, two of ginger, one teaspoonful of powdered cinnamon, one grated nutmeg, and a little mace, six or eight well beaten eggs and sugar to your taste. Bake with a bottom crust and rim, until solid in the middle.

AUNT EM.

MONEY MATTERS IN MARRIED LIFE.

The London Queen says that harmony is essential to the happiness of married life. Hence it follows that all causes of aggravation should be carefully avoided, and as nothing so frequently creates dispute as the discussion of money matters, it results that a good system of expenditure is necessary to the happiness of married life. There must be division of labor in the management of the income, and division of responsibility and privilege in the ownership. It is unfortunately true that men are apt to be unreasonable in money dealings with their wives, daughters and sisters. They have so thoroughly accepted the popular fallacy that women are extravagant, that their first impulse is to oppose every request for money. Most women are ready to believe this of men in general, but many a young wife imagines she has married the one exception to the rule, and therefore readily gives in when her first request for an allowance is answered by: "All that is mine is yours, and I will always give you all you ask for." If such a speech is followed up by the offer of a check book, with leave to draw to an almost unlimited extent on the husband's account, then an exceptionally conscientious and business-like woman might manage very well, without risking the peace of her household or the solvency of her husband. But it is more likely that he may mean her to personally ask for each separate sum she wants, and she will probably find that he is decidedly galled by frequent appeals for funds; indeed, the more careful the wife is, the less likely is it that such an arrangement will work well. If very anxious to be economical, she will probably ask for too little at once, and these constant driblets of expenditure will make more impression on his mind than rarer requests for larger sums. Besides, a man who would like such an irregular system, or want of system, would be sure to be unbusiness-like and not to keep accurate accounts, so that the wife would run the chance of being supposed to spend much more than she really received. Even the very best and most truly just men are worried by appeals for money, and all require to be watched carefully, so that they may be taken at the right moment. Every wise wife will, therefore, endeavor to persuade her husband to at least give the plan of an allowance a fair trial to promote family happiness.

Worth Knowing.

THAT, as a household remedy, for children and adults, Ayer's Pills are invaluable.

THAT, in Colds, with headache, backache, coated tongue, symptoms of fever, and a constant feeling of weariness, Ayer's Pills will often effect a cure when other remedies fail.

THAT these Pills are sugar coated, perfectly safe to take, do not gripe, and contain neither calomel nor any other dangerous drug.

I have used Ayer's Cathartic Pills in my family for the past thirty-five years. For stomach or liver troubles, or any irregularity of the bowels, and in case of Colds, Ayer's Pills are unequaled. I am never without them.—Frank Tisdale, Montpelier, Vt.

Ayer's Pills,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists and Dealers in Medicine.

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

LADIES We make a specialty of giving premiums for the forming of Tea Clubs for our pure Teas and Coffees. **We defy the world on price and quality.** No house gives same quality goods and premiums. A host of useful and ornamental articles to select from. Silver plated Casters for $5, $7, and $10 orders. Sets, elegant designs. **READ** Silver-plated Tea for $30 and $50 or Gold-Band China Decorated Dinner Set, Moss-Rose Toilet Set, Gold and Silver Watches, Clocks, etc. Illustrated price and premium list, and full particulars sent free. **SPECIAL OFFER:** To every **tenth** person that answers this advertisement we will send **free one pound of choice Tea.** Write at once. **THIS**

News of the Week.

HOME NEWS.

SATURDAY, November 13, 1886.

THE strike at the Chicago packeries is still in force, though there are strong expectations of speedy settlement by arbitration. The packers will not yield the eight-hour demand, although the men are willing to make a proportionate reduction in wages and to work over-time at the daily rate to make up the deficiency—it's the eight-hour principle they contend for, certain that they can get the 10 hours' pay soon. Agents of the packers have been hiring men in Boston, New York, Philadelphia and other Eastern cities to take the places of the strikers, and hundreds have been shipped West. Some of them deserted at Chicago owing to the persuasions of the strikers; but most of them are at work. Two regiments of State infantry and one of cavalry together with several hundred Pinkerton detectives guard the packeries and the "scab" workmen. No heavy rioting, but many deeds of violence and outrage. Whenever crowds of strikers could attack the Pinkertons or non-union workmen, they have invariably pounded them unmercifully. Business very sluggish as the new hands are a "poor lot." Many of the old hands are nearly starving, as they had saved nothing and the stores refuse credit. Much suffering to the men; much injury to the packers; much lost to the meat producers and consumers, especially the former..... The evidence in that St. Louis Adams Express robbery case so far as made public goes to prove that the messenger, David C. Fotheringham, was an accessory, or at least a willing victim in the affair.....Surveyor Beattie, of this port, who was shot by a discharged Custom-house employé last week, is out of danger. The would-be assassin is held for trial. .....The feat of jumping from the Suspension Bridge into the Niagara River, a drop of 195 feet, was successfully performed Sunday by Larry Donovan, who recently jumped from the Brooklyn Bridge. Broke some ribs and was nearly swept into the whirlpool by the fierce undertow.....At Lacrosse, Wis., the Law and Order League have compelled the authorities to enforce in their entirety the Sunday laws of the State. Great inconvenience to the citizens followed as a matter of course .....All the Mormons in Idaho, single-wived or many-wived, are disfranchised. Nearly all the inhabitants of Southern Idaho are Mormons..... ..... President Cleveland visited Boston and Harvard Monday, for the first time, to be present at the grand celebration of the 250th anniversary of the foundation of the University. He regretted that he wasn't a graduate of any college, but found consolation in the fact that only 12 of his 21 predecessors had a collegiate or university education. He, very properly, declined to receive an honorary degree..... ....The students of Packer Institute, Brooklyn, one of the largest female seminaries in the country, pledge themselves not to use the feathers of wild birds for decoration, and to discourage such use in others.....At Gettysburg a Confederate monument to the memory of the second Maryland infantry has been erected. The first Confederate..... .. Saturday Theodore Roosevelt sailed from New York for Europe, where he will get married..... ....Woman suffrage, passed last week in the Vermont House by a vote of 132 to 82, has been defeated in the Senate 18 to 10..... Lord Lansdowne, the Governor-General of Canada has returned from England, and it is expected that the new elections will soon be ordered .....Geysers in the Yellowstone Park are in a disturbed state, the earth in the vicinity quakes and an eruption is expected... The Central Labor Union in New York City is booming a national political party for 1888, with George as the Presidential candidate. The Knights of Labor element, however, does not appear to be harmonious in its consideration of the scheme.... ....Prof. Foster, an Iowa Wiggins, predicts a great meteorological disturbance from December 4 to 17, during which periods there will be blizzards and great electrical commotion. The Eastern States are warned that their dose will come along about Dec. 9....President Cleveland has given public notice that until Congress meets he can see no visitors except upon actual public business of importance, not connected with office-seeking.....The long-standing factory troubles at Augusta, Ga., by which over 3,000 hands were idle, have been settled.. .....The Supreme Court of Mississippi has decided that the prohibition or local option law recently passed is constitutional..... ....The Board of Missions of the Methodist Episcopal Church, which closed its session in New York Saturday, appropriated $569,447 for foreign, and the home missions will probably reach $11,000,000.....It is said that Colonel John Moore, U. S. A., now at San Francisco, will be tendered the Surgeon General-ship of the army..... .. ....,. ....A syndicate of window glass manufacturers was formed at Pittsburg Pa., Tuesday, "to regulate prices and control production".. The Western Nail Associations and the Flint Glass Veal Associations have been separately in session at Cincinnati "to regulate prices".. In the famous or notorious case of the Government against the Bell Telephone Company, in the United States Circuit Court at Cincinnati, Ohio, Judges Sage and Jackson, last Thursday, in a voluminous decision, dismissed the case for want of jurisdiction, without prejudice to instituting a suit elsewhere. It was decided that the parent company had no general agent in Ohio, and that service had been made only on local agents. As to the claim of the Government that the dealings in a patent made the company a domestic in the entire territory of the United States co-existent with the patent, the court held that it could not be sustained. The grant to a patentee is the right to exclude others from making or selling his patent. His right to sell is only the common law right and is not a franchise from the Government. The headquarters of the parent company are in Boston, and the suit should have been brought in Massachusetts. The case all along has been of such a dubious nature that it is hardly likely it will be renewed by the Government elsewhere.... ... The Supreme Court, at Washington, has granted the motion made last week to advance and hear together the six telephone cases now on the docket, and ordered that they be set for argument as one case January 24 at the head of the calendar. ....A filibustering expedition into Mexico, with Editor Cutting as one of the leaders, is being organized in the Southwest. It is proposed to make an independent Republic of the three Northern States of Mexico. Many capitalists, native and foreign, having large land and mining interests in those States, are reported to be backing the movement..... ....The conditions for admitting the territories of Saskatchewan, Assiniboia and Alberta as a new province into the Dominion have been practically settled, and it will soon be admitted.... ...Wisconsin voted to amend its constitution so as to give women the ballot in elections for school officers, except in cities where the school boards are appointed by the Aldermen.....The proposal to amend the Constitution of New York State has been carried..... .....

FOREIGN NEWS.

SATURDAY, November 13, 1886.

IN Bulgaria, the Great Sobranje, last Tuesday, elected Prince Waldemar, third son of King Christian, of Denmark, to succeed Prince Alexander of Battenberg. Christian's eldest son and heir is married to a daughter of the King of Sweden: the second son is King of Greece, the third is Waldemar. His oldest daughter is the wife of the Prince of Wales, and will be Empress-Queen of the British Empire: his second daughter is Empress of Russia, and his third, Duchess of Cumberland, wife of Prince Ernest August, cousin of Queen Victoria and claimant for the throne of Saxony. His brother, the King of Greece, would resign, if Waldemar became Prince of Bulgaria, and, moreover, the Czar is strongly opposed to his election; consequently his father says he must not accept the position on any account. Prince Nicholas of Mingrelia is Russia's only candidate, but Austria-Hungary is opposed to him.—Foreign news next week is likely to be interesting and will be full.....

AGRICULTURAL NEWS.

SATURDAY, Nov. 13, 1886.

THE Stock Yards Company of St. Paul Minn., has purchased ground on Staten Island N. Y., with 1,100 feet water front, for terminal facilities for the exportation of cattle. It has made arrangements for securing great facilities for slaughtering and caring for large numbers of American cattle at Barrow, a new port 45 north of Liverpool, England..... Very large quantities of apples are being shipped from Halifax to New York and England. The British Queen took 7,000 barrels for London the other day. One Nova Scotia dealer is handling 30,000 barrels, mostly for New York markets.....It is the general opinion at Havana that the total production of sugar in the season 1886-'87 will amount to over 80,0000 tons and exceed the largest crop hitherto raised on the island.....In a fight Thursday between fence-cutters and State Rangers near Brownswood, Texas, two of the former were killed after cutting 1½ mile of barbed wire fence..... .....Boston exported last week, by steamer, 396 live cattle and 2,376 quarters of beef. American meat is very cheap in England—8½ cents pter pound for prime.. ...Sheep feeding is being prepared for most extensively in Nebraska, and plenty of fat sheep, and good ones, may be expected from that State next Spring. .....Oregon pays two cents for every squirrel killed, and one man was recently paid for 125,000 squirrel tails which he had collected... ....

.....The Farmers' National Aliance met in convention, Thursday, in Chicago..... J. C. Greenough, the lately deposed President of the Massachusetts Agricultural College, has been elected Principal of the Westfield Normal School. He used to be Principal of the Rhode Island Normal School..... .....The Treasury Department has decided that poppy oil is free of duty, and that linseed oil is dutiable at the rate of 25 cents per gallon.....The culture of tobacco in Germany which has declined since 1881, is now progressing, 1,086,597 acres having been planted this year against 1,052,859 acres last year. In the last census year the United States had only 638,841 acres under tobacco; but the yield per acre here is much heavier than in Germany. In 1879 the above acreage yielded 472,964,158 pounds. .....The Commissioner of Agriculture has been notified by chemist Wiley, from Fort Scott, Kans., that by the diffusion process he has secured an average of 120 pounds of sugar per ton from 83 tons of Louisiana cane. It is claimed that the old process would have yielded only 80 pounds to the ton. This is regarded by the authorities at the Agricultural Department as the fulfillment of the promises of important results given by the first incomplete experiments in the diffusion process as applied to sugar cane. The process was developed in Europe for application in the manufacture of beet sugar, and has been several times tried in this country upon the sugar cane, but hitherto without success, owing to improper machinery, and the necessity of considerable modifications to meet the difference in the material to be worked... ....Fish Commissioner Baird is distributing carp from the Government ponds to applicants in all parts of the country. Individual applicants get 20 fish—52,000 would be required to fill private orders for Ill., Ia., Wis. and Ind., and the State Commissioners of those States ask for 38,000 more—a hint at the number required for the whole country..... The census of the island of Cuba shows 1,200 sugar plantations, 5,000 tobacco plantations, 160 coffee plantations, 25 cocoa plantations, 5,000 grazing farms, 20,000 small farms, 90,000 warehouses, factories, etc..... ....United States Senator Plumb, referring to the reports that New York and Colorado syndicates had been formed for the purpose of purchasing the Cherokee Strip, says the Cherokees have not the original right to make such sale, that the Government has an option to purchase, which it will not waive to permit purchase by any private parties, and that no sale will be permitted by Congress except to the Government, and that for the only and sole purpose of resales to actual settlers in 160-acre tracts....Paris has just been taking its annual meat census and finds that she is eating more horseflesh and less pork than ever. Donkey and mule meat are also growing in favor with the Parisians..... ... State Inspector Lowe, of N. J., has ordered three very sick cattle to be killed at Verona, Essex Co., N. J., as affected with contagious pleuro-pneumonia, and a number of exposed animals to be quarantined. Much alarm among local farmers..... .....State Veterinarian Casewell and Acting Health Commissioner Garroth have decided to cooperate in a house-to-house inspection of cattle at Chicago. A number of cows in the stables of wealthy citizens are reported to be "exposed to disease." It seems nothing in the way of stamping out the disease can be done till Congress and the Illinois State Legislature meet to pass suitable laws and make adequate appropriations; meanwhile some of the cattle dealers persistently deny that the disease is contagious pleuro-pneumonia...Dr. Seabright, of the Indiana State Board of Health, reports that a month ago 100 calves were received at Frankfort from Ohio and sold to farmers. They soon showed signs of pleuro-pneumonia, One man—Baker—killed and buried 30 he had bought, but several of his own cattle had taken the disease, showing its contagious nature. It is reported that more than 1,000 cattle are affected with the plague in Jasper and Clinton Counties, Indiana..... ... A telegram from Parsons, Southern Kansas, says reports come from all directions that cattle are dying in great numbers from dry murrain, owing to short pastures and semi-starvation first, and then gorging when turned into the corn-stalks .....Black-leg is proving disastrous about Shelbyville, Ill..... .....It is reported from Minneapolis, Minn., that syndicate of Canadian lumbermen, with partners in that State, have acquired the title to about 500,000,0000 feet of pine timber in Northwestern Minnesota, and are arranging to gobble up the rest of the vast timber belt on the northern slope—an area including about one-half of the entire State. It is charged that the clauses in the Sundry Civil Bill providing for a commission to treat with the Indians now occupying these lands for their removal to White Earth Agency was secured directly in the interest of this Canadian syndicate. Should the proposed treaties be confirmed, it is alleged that $10,000,000 worth of Indian pine will certainly go into the hands of a foreign syndicate and $15,000,000 worth of lumber that Minnesota and Dakota will shortly need, will be owned by the same pool.

..The stockmen of Upper Monanta have driven 75,000 cattle on the Piegan Reservation to range during the coming Winter. They claim they had to do this, as feed is scarce. The authority of the Indian agent and the Indian Bureau was obtained.... The Ohio Live Stock Commissioners report that in the last six years 890,566 hogs died of disease in the State, worth $4,130,285. About 10 per cent. of the "crop" die each year. The present appropriation for the Commission is only $2,000; the Board considers $100,000 would not be exorbitant next year. At its meeting the other day Dr. J. S. Butler, of Piqua was appointed State Veterinarian, and the following gentlemen consulting veterinarians at the points named: J. B. Hilloek, Columbus; J.C. Myer, jr., Cincinnati; W. R. Howe, Dayton; W. C. Fair, Cleveland; J. V. Newton, Toledo; R. W. Whitehead, Youngstown, and W. F. Kerr, Wooster. ....A Canadian Order in Council ordains that from Nov. 6 all cattle imported into the Dominion from any part of the United States must undergo a quarantine of 60 days—restriction to extend from ocean to ocean..... The National Grange, Patrons of Husbandry, composed of delegates from every State and Territory in the Union, commenced their 20th annual session in Philadelphia, Thursday. The meetings are secret and will continue about eight days.....The annual convention of the National Butter, Cheese and Egg Association began in Chicago the same day. About 600 leading dairymen of the Eastern and Central States are in attendance.....

Mr. Wilson's Neuralgia and Headache.

Mr. Edward L. Wilson, of No. 1125 Chestnut st., Philadelphia, Pa., was photographer to the Centennial Exhibition at Philadelphia, and also to the recent International Cotton Exhibition at New Orleans. He is also widely known as a lecturer on Egypt, Sinai, and Palestine, which countries he illustrates to his audiences by photographic views taken by himself in 1882. He writes as follows:

"I was several years ago so run down in physical condition that the insurance men would not take a risk on my life. I became so prostrated that I could not sleep more than an hour or two in the course of a night. I suffered with acute neuralgia, and with headache, which, when they came on suddenly, would render me powerless to think or act. I consulted Drs. Starkey & Palen, and concluded to give their Treatment a thorough trial. In less than a month I began to feel a great change and *it was not long until it was as good as new.* I have since engaged in my old duties with more than my former activity, and my work seldom tires me."

A monograph on neuralgia, published by Drs. STARKEY & PALEN (whose Compound Oxygen Treatment has been so successful that they have received hundreds of letters from patients who report cures of neuralgia and headache), will be furnished free to all who ask it by mail or personally at their new offices No. 1529 Arch Street, Philadelphia.—*Adv.*

Crops & Markets.

SATURDAY, November 13, 1886.

The Mark Lane Express, in its review of the British grain trade during the past week, says: Deliveries of wheat are restricted. The provincial markets are very sparingly supplied. Quotations are firm. The sales of English wheat during the week were 49,325 quarters at 30s 8d, against 60,431 quarters at 31s 1d during the corresponding period last year. The London wheat trade is slow and values are unchanged. The supplies or American wheat have largely increased exceding all precedent. The stocks of flour are heavy. Corn is scarce and three to six cents higher.

The report of the Department of Agricul-

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

ture says the cotton returns for November attest the rapid progress of picking, the unusual cleanness of fiber and the shortness of the late crops on light uplands and districts most affected by drought. Light frosts, sufficient to arrest growth, have occurred in the northern districts, reaching to the center of the cotton belt. In Arkansas and Tennessee a large yield is assured, and in Texas the yield is higher than in the census year, when the product was thirty-seven hundredths of a bale per acre. On the Atlantic coast the effect of the excessive early rains and the long-continued drought of the later season is apparent in reduced production. The following percentages of the several States indicate the probable produce: Virginia 71, North Carolina 74, South Carolina 72, Georgia 76, Florida 82, Alabama 74, Mississippi 77, Louisiana 78, Texas 71, Arkansas 86, Tennessee 88.

The yield of corn, according to the revised returns of yield, is 22 bushels per acre, making a product upon the present adjustment of acreage, of 1,668,000,000 bushels. This accords well with recent returns of condition, and will not be materially changed in the final review of the work of the year. The potato product is nearly the same as last year, with higher yields in the East and lower in the West. The average is 73 bushels per acre, giving a product of 163,000,000 bushels. The buckwheat crop makes a yield of about 13 bushels per acre, promising a product exceeding 11,000,000 bushels. The apparent production of tobacco is at a rate slightly exceeding an average of 70 pounds per acre, or about 485,000,000 pounds, which is equal to the average requirements of consumption and exportation. The average rate of yield for the hay crop is close to one and two-tenths tons per acre, and the apparent product about 45,000,000 tons.

Winter packing starts with a movement for the first week in hogs below that at the same time last year, returns from nine leading points showing a total of 295,500 hogs against 390,000 last year. The labor troubles at Chicago have curtailed operations and directed many shipments to other points. But the Chicago trouble has demoralized the trade in all directions, for Western packers at all the chief points are reluctant to contract for future delivery through fear of a general strike of employés. Hence the prices of hogs have fallen nearly $1 all around—a tribute the farmers have to pay to the discontent of labor organizations. The cattle and sheep interests also have suffered to a considerable extent.

Brown's Bronchial Troches

Are known and used all over the world, and at all seasons, for the relief and cure of Coughs, Colds, Sore Throat, and Bronchial troubles. Sold only in boxes, with the fac-simile of the proprietors, John I. Brown & Sons, on the wrapper. Price 25 cents.—*Adv.*

MARKETS BY TELEGRAPH.

SATURDAY, November 13, 1886

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
In my Remedy, I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.
"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.
"Have used the remedy with success."—D. G. BARBER, Easton, Md.
This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.
"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIN, Grant City, Mo.
"We would not risk feeding a pen of hogs without the remedy."—WHITE & CO., Gibsonton, Pa.
"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.
"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.
"It has never failed to arrest the disease yet."—JONES & MUSSELMAN, St Paris, O.
"I have sold over $2,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.
The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.
Prices, $2.50, $1.25, and 50 cents per package. 25 pound cans, $12.50.

HOLIDAY GIFTS.

For the Young.

I HOPE every one of the Cousins will have a good Thanksgiving. We have lots of things to be thankful for. Think them over when you get a chance and you will find that they would fill a good-sized book. Lots of us may think we have pretty hard times, and it may seem as though things are all wrong and never can be better. But wait a little, keep easy and cheerful, don't give up, but keep on doing the best you can. These things always work out right in the end if we only stick to them. The right thing to do on Thanksgiving Day is to let all the troubles go and keep nothing but the good things in mind. Remember this, and have just as good a time as you can.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

THERE was a good spot in old Johnson after all.

"I'm sorter sorry fer the boy," he said, as he rubbed his hand over his mouth. "He ain't over bright, but I dunno ez I'd a run him last night ef I'd a knowed this wuz commin'. Hows'ever, we don't none on us know mor'n half on it, an' the time hez fer ter come when we find it out, too."

Johnny had started for school little thinking how near he was to his long-promised holiday. Old Johnson saw him from the window trudging sturdily along the road.

"I wish you'd tell him, teacher, I've got ter go ter the woods. Like enough he kin hit a team goin' over."

I think old Johnson was glad to have me tell Johnny. I hope he was a little sorry for what he had said, and so did not care to face the little boy. Be that as it may, I promised to do the errand and started for the school house. Mr. Hardhack's sad news appeared to have made its way about the district. The proposed holiday, in consequence of the death of 'Squire Barnes, kept the children at home. I found Johnny at the school house alone. He stood kicking his heels against the door and smiling up at me till his round face seemed like one ripple. It seemed hard, indeed, to take the pleasure out of that little face.

"Johnny," I said, "we have just heard from your mother."

"She ain't dead, teacher, is she?" he asked eagerly.

I think he must have read it in my face. We cannot hide such things.

"Yes, my boy," I said slowly, "she is." The light look faded out of his face. Two great tears forced themselves out of his eyes, and he gave one great sob, and turned his face towards the door. He put his jacket sleeve over his eyes and pushed his face far into the corner of the door. Poor little fellow, there was a dreadful loneliness about his grief. He never had known what sympathy meant. His only thought was that he must grind down this great sorrow alone.

"Never mind, Johnny," was all I could say. I patted the great brush of hair. The little mourner pushed his face deeper into the corner, but reached up his other hand to take hold of mine.

"Well, well, what's this?" broke in a voice behind us. "Been thrashing that boy? I'm sorry. You should have taken a bigger one, sir."

I turned to find the director standing by us. I explained matters in a few words. The director dropped his pompous manner at once.

"That's bad," he said, kindly. "Come little boy, you must be a little man now. I'm going to drive over that way, and I'll take you and the teacher along. Come on, now, brave folks never give up, you know."

He took hold of Johnny's arm and led him out of the yard. I do not think he had any errand that would have led him past the County house, but he had a big, warm heart that felt for the poor, lonely little boy. He never let Johnny stop until we reached his own house. Then he took pains to show the little fellow the rabbits, the lame cat and the parrot. He talked so pleasantly that Johnny was at last induced to take his jacket sleeve away from his eyes and let Mrs. Forest wash his face. A great piece of mince pie went far towards stopping the sobs, and a piece of cake enabled him to look up at the director and say without choking—"I reckon you're the best man I ever seen, an' old Johnson don't know nothin' about it."

We brushed up Johnny's strange assortment of clothing, and then we all got into the director's wagon and started for the County house. It was a sad journey for us. Johnny choked now and then in spite of the director's words, and there were two wide tracks down his cheeks from his eyes. As we rode along the words of an old poem kept running over and over in my mind. Do what I would I could not keep them out:

"Rattle his bones over the stones,
He's only a pauper that nobody owns."

—I kept thinking over and over again, why should there be paupers and poor people and so much trouble and sorrow? If we could make the world, doubtless we wouldn't have them. But the world is made: we can only make it over as best we can.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

SCIENTIFIC TRUTH.

REGARDING THE FUNCTIONS OF AN IMPORTANT ORGAN.

Of Which the Public Knows but Little, Worthy Careful Consideration.

To the Editor of the Scientific American:

Will you permit us to make known to the public the facts we have learned during the past eight years, concerning disorders of the human Kidneys and the organs which diseased Kidneys so easily break down? You are conducting a Scientific paper, and are unprejudiced except in favor of TRUTH. *It is needless to say no medical Journal of "Code" standing would admit these facts, for very obvious reasons.*

H. H. WARNER & CO.,
Proprietors of "Warner's Safe Cure."

That we may emphasize and clearly explain the relation the kidneys sustain to the general health, and how much is dependent upon them, we propose, metaphorically speaking, to take one from the human body, place in the wash-bowl before us, and examine it for the public benefit.

You will imagine that we have before us a body shaped like a bean, smooth and glistening, about four inches in length, two in width, and one in thickness. It ordinarily weighs, in the adult male, about five ounces, but is somewhat lighter in the female. A small organ? you say. But understand, the body of the average size man contains about *ten quarts of blood, of which every drop passes through these filters or sewers*, as they may be called, *many times a day*, as often as through the heart, making a complete revolution in *three minutes*. From the blood they separate the waste material, working away steadily night and day, sleeping or waking, tireless as the heart itself, and fully of as much vital importance: removing impurities from 65 *gallons of blood each hour*, or about 49 barrels each day, or 9,125 hogsheads a year! What a wonder that the kidneys can last any length of time under this prodigious strain, treated and neglected as they are?

We slice this delicate organ open lengthwise with our knife, and will roughly describe its interior:

We find it to be of a reddish-brown color, soft and easily torn; filled with hundreds of little tubes, short and thread-like, starting from the arteries, ending in a little tuft about midway from the outside opening into a cavity of considerable size, which is called the pelvis, or, roughly speaking, a sac, which is for the purpose of holding the water to further undergo purification before it passes down from here into the ureters, and so on to the outside of the body. These little tubes are the filters which do their work automatically, *and right here is where the disease of the kidney first begins.*

Doing the vast amount of work which they are obliged to, from the slightest irregularity in our habits, from cold, from high living, from stimulants, or a thousand and one other causes which occur every day, they become somewhat weakened in their nerve force.

What is the result? Congestion or stoppage of the current of blood in the small blood vessels surrounding them, which become blocked; these delicate membranes are irritated; inflammation is set up, then pus is formed, which collects in the pelvis or sac; the tubes are at first partially, and soon are totally, unable to do their work. The pelvis sac goes on distending with this corruption, pressing upon the blood vessels. All this time, remember, the blood, which is entering the kidneys to be filtered, is *passing through this terrible, disgusting pus*, for it cannot take any other route!

Stop and think of it for a moment. Do you realize the importance, nay the vital necessity, of having the kidneys in order? Can you expect when they are diseased and obstructed, no matter how little, that you can have *pure blood and escape disease*. It would be just as reasonable to expect, if a pest-house were set across Broadway and countless thousands were compelled to go through its pestilential doors, and escape from contagion and disease, as for one to expect the blood to escape pollution when constantly running through a diseased kidney.

Now, what is the result? Why, that the blood takes up and deposits this poison as it sweeps along into every organ, into every inch of muscle, tissue, flesh and bone, from your head to your feet. And whenever, from hereditary influence or otherwise, some part of the body is weaker than another, a countless train of diseases is established, such as consumption in weak lungs, dyspepsia, where there is a delicate stomach; nervousness, insanity, paralysis or heart disease in those who have weak nerves.

The heart must soon feel the effects of the poison, as it requires pure blood to keep it in right action. It increases—its stroke in number and force to compensate for the natural stimulus wanting, in its endeavor to crowd the impure blood through this obstruction, causing pain, palpitation, or an out-of-breath feeling. Unnatural as this forced labor is, the heart must soon falter, becoming weaker and weaker until one day it *suddenly stops*, and death from apparent "heart disease" is the verdict.

But the medical profession, learned and dignified, call these diseases by high sounding names, treat them alone, and patients die, *for the arteries are carrying slow death to the affected part*, constantly adding fuel brought from these suppurating, pus-laden kidneys, which here in our wash-bowl are very putrefaction itself, and which should have been cured first.

But this is not all the kidneys have to do: for you must remember that each adult takes about seven pounds of nourishment every twenty-four hours to supply the waste of the body which is constantly going on, a waste equal to the quantity taken. This, too, the kidneys have to separate from the blood with all other decomposing matter.

But you say, "My kidneys are all right. I have no pain in the back." Mistaken man! People die of kidney disease of so bad a character that the organs are rotten, and yet they have *never there had a pain nor an ache!*

Why? Because the disease begins, as we have shown, in the interior of the kidney, where *there are few nerves of feeling* to convey the sensation of pain. Why this is so we may never know.

When you consider their great work, the delicacy of their structure, the ease with which they are deranged, can you wonder at the ill-health of our men and women? Health and long life cannot be expected when so vital an organ is impaired. No wonder some writers say we are degenerating. Don't you see the great, the extreme importance of keeping this machinery in working order? Could the finest engine do even a fractional part of this work without attention from the engineer? Don't you see how dangerous this hidden disease is? It is lurking about us constantly, without giving any indication of its presence.

The most skillful physicians cannot detect it at times, *for the kidneys themselves cannot be examined* by any means which we have at our command. Even an analysis of the water, chemically and microscopically, reveals nothing definite in many cases, even when the kidneys are fairly broken down.

Then look out for them, as disease, no matter where situated, to 93 per cent., as shown by after-death examinations, has its origin in the breaking down of these secreting tubes in the interior of the kidney.

As you value health, as you desire long life, free from sickness and suffering, give these organs some attention. Keep them in good condition and thus prevent, as (is easily done) all diseases.

Warner's Safe Cure, as it becomes year after year better known for its wonderful cures and its power over the kidneys, has done and is doing more to increase the average duration of life than all the physicians and medicines known. Warner's Safe Cure is a true specific, mild but certain, harmless but energetic and agreeable to the taste.

Take it when sick as a cure, and never let a month go by if you need it without taking a few bottles as a preventive, that the kidneys may be kept in proper order, the blood pure, that health and long life may be your blessing.

As an experiment, to test the value of advertising in this paper, and to get it introduced into every family in the land, we offer the

PHILADELPHIA LADIES' Home Journal AND **PRACTICAL HOUSEKEEPER 3 MONTHS** *ON TRIAL!* ON RECEIPT OF **ONLY 10 CTS.** *Silver or Stamps.*

It has the largest circulation of any newspaper or periodical published in the United States, having over

400,000 Paid Subscribers,

of which over 300,000 are permanent YEARLY subscribers, all secured in 3 years, thus proving that where it is once read, for at least three months, it is indispensable ever afterward.

A Story that will make you laugh and make you cry:

"THE CHARITY OF THE JONESVILLIANS"
BY
Josiah Allen's Wife

Written for the JOURNAL, and will begin in December. It is rich---full of spice, keen wit, humor and pathos. While it is extremely humorous, full of irony, brilliant hits, and irresistibly funny, it is tender and pure, and comes from the depth of the author's heart, appealing as it does to charity for the unfortunate family of a drunkard. The "Jonesvillians" can be found in all our towns and villages, as well as in the larger cities.

HOME COOKING.

PERSONALS.

EX-PRESIDENT ARTHUR'S friends, who visit him in his retirement, are hopeful of his recovery, because he is hopeful.

PRESIDENT CLEVELAND has contributed $25 for the purchase of seed wheat for the sufferers by the drought in northwestern Texas.

SENATOR DON CAMERON'S daughter is a noteable horsewoman. One of her latest trips on horseback was from her father's home in Pennsylvania to his home in Washington.

ANDREW CARNEGIE, the millionaire philanthropist, of Pittsburg, Pa., who has been ill with typhoid fever for several weeks, is said to be convalescing. His brother died last week and his mother last Wednesday.

TOM FINTY, the biggest railroad-tie merchant in the West, was formerly a section hand on the Ohio and Mississippi Railroad. He is now the richest man in Clay County, Illinois, and employs 100 hands. He lives alone, and dresses like a day laborer.

MR. ROBERT GARRETT, president of the Baltimore and Ohio Railroad, has three private secretaries, one of whom has become rich by speculating in stocks on tips given him by his employer. Mr. Garrett owns one of the finest private libraries in the country, and has decidedly literary tastes.

M. PAUL BERT, French Minister Resident in Annam, has died of pestilential fever. M. Bert was long professor of physiology in the faculty of science at Bordeaux, and achieved a high reputation in the scientific world. He was elected to the National Assembly in 1871, and 10 years later was appointed Minister of Public Instruction. He wrote much on scientific topics. He was 53 years old.

FRED ARCHER, the most successful and celebrated of English jockeys, shot himself dead, Monday, while half crazy from illness brought on by over-training in reducing his weight to 116 pounds, to fit him for the saddle. He rode like a demon to win every time; was not only the employé, but the companion, of lords and ladies, and left over $500,000, every cent of which he had earned or won himself. His death caused a greater sensation than would that of a Prime Minister.

2. **Winter Evening Recreations,** a large collection of Acting Charades, Tableaux, Games, Puzzles, etc., for social gatherings, private theatricals, and evenings at home.
3. **Back to the Old Home.** A Novel. By Mary Cecil Hay, author of "Hidden Perils."
4. **Dialogues, Recitations and Readings,** a large and choice collection for school exhibitions and public and private entertainments.
5. **The Standard Letter Writer** for Ladies and Gentlemen, a complete guide to correspondence, giving plain directions for the composition of letters of every kind, with innumerable forms and examples.
6. **The Frozen Deep.** A thrilling Novel. By Wilkie Collins, author of "The Woman in White," etc.
7. **Red Court Farm.** An interesting Novel. By Mrs. Henry Wood, author of "East Lynne," etc.
8. **The Lady of the Lake.** By Sir Walter Scott. "The Lady of the Lake" is a romance in verse, and of all the works of Scott none is more beautiful than this.
9. **In Cupid's Net.** A Novel. By the author of "Dora Thorne."
10. **Amos Barton.** A Novel. By George Eliot, author of "Adam Bede" "The Mill on the Floss" etc.
11. **Lady Gwendoline's Dream.** A Novel. By the author of "Dora Thorne."
12. **The Mystery of the Holly Tree.** A Novel. By the Author of "Dora Thorne."
13. **The Budget of Wit, Humor and Fun,** a large collection of the funny stories, sketches, anecdotes, poems and jokes.
14. **John Bowerbank's Wife.** A Novel. By Miss Mulock, author of "John Halifax, Gentleman," etc.
15. **The Gray Woman.** A Novel. By Mrs. Gaskell, author of "Mary Barton," etc.
16. **Sixteen Complete Stories** by Popular Authors, embracing love, humorous and detective stories, stories of society life, of adventure, of railway life, etc., all very interesting.
17. **Jasper Dane's Secret.** A Novel. By Miss M. E. Braddon, author of "Aurora Floyd," etc.
18. **Fancy Work for Home Adornment,** an entirely new work upon this subject, containing easy and practical instructions for making fancy baskets, wall pockets, brackets, needle work, embroidery, etc., etc., profusely and elegantly illustrated.
19. **Grimm's Fairy Stories for the Young.** The finest collection of fairy stories published. The children are delighted with them.
20. **Manual of Etiquette** for Ladies and Gentlemen, a guide to politeness and good breeding, giving the rules of modern etiquette for all occasions.
21. **Useful Knowledge for the Million,** a handy book of useful information for all, upon many and various subjects.
22. **The Home Cook Book and Family Physician,** containing hundreds of excellent cooking recipes, hints to housekeepers, telling how to cure all common ailments by simple home remedies.
23. **Manners and Customs in Far Away Lands,** a very interesting and instructive book of travels, describing the peculiar life, habits, manners and customs of the people of foreign countries.
24. **87 Popular Ballads.** Same size as sheet music. Words of all the old and best songs.
25. **Called Back.** A Novel. By Hugh Conway.
26. **At the World's Mercy.** A Novel. By Florence Warden, author of "The House on the Marsh," etc.
27. **Mildred Trevanion.** A Novel. By "The Duchess," author of "Molly Bawn," etc.
28. **Dark Days.** A Novel. By the author of "Called Back."
29. **Shadows on the Snow.** A Novel. By B. L. Farjeon, author of "Bread-and-Cheese-and-Kisses," etc.
30. **Lealine.** By Mary Cecil Hay, author of "Brenda Yorke."
31. **Gabriel's Marriage.** A Novel. By Wilkie Collins, author of "No Name," etc.
32. **Keeping the Whirlwind.** A Novel. By Mary Cecil Hay, author of "Old Middleton's Money," etc.
33. **Dudley Carleon.** A Novel. By Miss M. E. Braddon, author of "Lady Audley's Secret," etc.
34. **A Golden Dawn.** A Novel. By the author of "Dora Thorne," etc.
35. **Valerie's Fate.** A Novel. By Mrs. Alexander, author of "The Wooing O't," etc.
36. **Sister Rose.** A Novel. By Wilkie Collins, author of "The Woman in White," etc.
37. **Anne.** A Novel. By Mrs. Henry Wood, author of "East Lynne."
38. **The Laurel Bush.** A Novel. By Miss Mulock, author of "John Halifax, Gentleman," etc.
39. **Robinson Crusoe.** A thrilling narrative by Daniel De Foe, describing the adventures of a castaway in the South Pacific Ocean.
40. **How to Make Poultry Pay.** A practical and instructive series of articles by Mr. P. H. Jacobs, Poultry Editor of "The Farm and Garden" Phila. Illustrated.
41. **Parlor Magic and Chemical Experiments,** a book which tells how to perform hundreds of amusing tricks in magic and instructive experiments with simple agents.
42. **Gems of the Poets,** containing charming selections from Tennyson, Longfellow, Whittier, Byron, Shelley, Moore, Bryant, and many others.
43. **Building Plans for Practical, Low-cost Houses,** a full description and plans of Eight modern houses, ranging in price from $500 to $4500. Illustrated.
44. **Anecdotes of Public Men**—Washington, Franklin, Webster, Clay, Tilden, Lincoln, Scott, Grant, Garfield, Gladstone, Butler, Hancock, Lee, and all the leading men of the century.
45. **Æsop's Fables.** The work of an ancient genius. Children have read them for centuries and grown people quote them every day.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1922. NEW YORK, NOVEMBER 27, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Vineyard.

HUBER'S SEEDLING GRAPES.

HUBER, of Illinois City, Ills., again sends us a number of his seedling grapes. Plants of all were sent to the Rural Grounds in 1884, but they were nearly dead when received. Some have survived, and will fruit next year; others died. The following grapes are all large and showy. The fault would seem to be, so far as quality is concerned, that they resemble each other too closely. If all were equally productive and hardy, two or three might well be selected for propagation, the rest destroyed. But we bear in mind that a new grape which is a success in one place is a failure in others, so that these seedlings must be tried in different States ere a just estimate of their worth can be arrived at.

JOHN A. WARDER, Fig. 434, p. 791, is a jet-black grape with a dense blue bloom. The berries are large, two to three-seeded. The quality is much the same as that of Concord, though the flesh is sweeter. The skin is quite firm, and we should suppose the grape would ship and keep far better than the Concord. The illustration shows the average bunch. Mr. Huber writes us that the berries commence ripening with him Aug. 15, and that they are black before fully ripe. He says it is an extraordinary bearer.

MARIE LOUISE, Fig. 435, p. 791, is a white grape of a golden color when fully ripe, with considerable bloom. The berry is large, two-seeded, sweeter, sprightlier, and better than Concord. The skin is thin, but quite firm, and the grape ships well. It is showy and excellent. The illustration is an exact counterpart of one of the bunches sent to us. Mr. Huber says it ripens with Concord, and is very hardy.

BERTHA is a light-green grape, with medium-sized berries crowded in the cluster, as shown. The quality is scarcely better than that of Concord, though we should judge the variety to be very prolific from the number of clusters on the stem sent to us. See Fig. 433.

Emma is a light-green grape, of medium size, with thin bloom, and in quality scarcely better than the Concord. T. T. Huber is about the same as Concord, with two to three large seeds in each berry. The berries are large light-green, with ample bloom. Alphonse is a large, light-green berry, with the quality of Concord. Henry is a smaller berry of the same color and quality. Barbara Braendly and Marguerite are much the same. These varieties are said to be hardy.

GRAPE CUTTINGS.

IT is now time for making grape cuttings, and putting them in condition for the Winter. Different methods are in use for their preservation during the cold season, but all of them include the idea of keeping them moist and unfrozen. Freezing ruptures the cells, and makes the cuttings decay; heat without moisture dries them up, and they cannot take root. Every perfect cutting has sap enough stored away in its cells to make it take root if properly treated. I have been successful in raising vines from cuttings by three different methods.

1st. Take cuttings of two buds in the Fall from last year's wood, tie them in bundles properly labeled, and bury them in the ground out of the reach of frost, or protected from frost in some way. They should be cut quite close to the lower bud, and a space of an inch or two should be left above the upper bud. In the Spring set them in fine loam in a warm location; keep them moist, and there will be no trouble in making them live.

2d. Take cuttings of two buds as before; place them in earth in pots or boxes in the cellar, the cuttings being set as you would set them for growth out-of-doors, being careful to place them where they will not freeze. Keep the earth around them moist all Winter. In March or early Spring they may be brought into a warm room, and they will start very early.

3d. Take two-bud cuttings in the Fall, bundle and label, the butts being all placed the same way, and put them into pails or any vessel that will hold water. Put in the bundles butts down, and keep an inch or two of water in the vessel all Winter. Care must be taken that the water does not evaporate and leave the cuttings dry, as it would be fatal to them. They should be kept in a cool cellar, where the mercury is above freezing point. In March they can be put into pots or boxes of earth, and placed in a warm room, or where the ground is warm enough out-of-doors, they can be set where they are to remain.

I have been more successful in this last way than in any other. The cuttings come out bright in the Spring, start immediately, and the vines make a good growth. It may not be the best way for nurserymen, but for small growers I do not know of any better method.

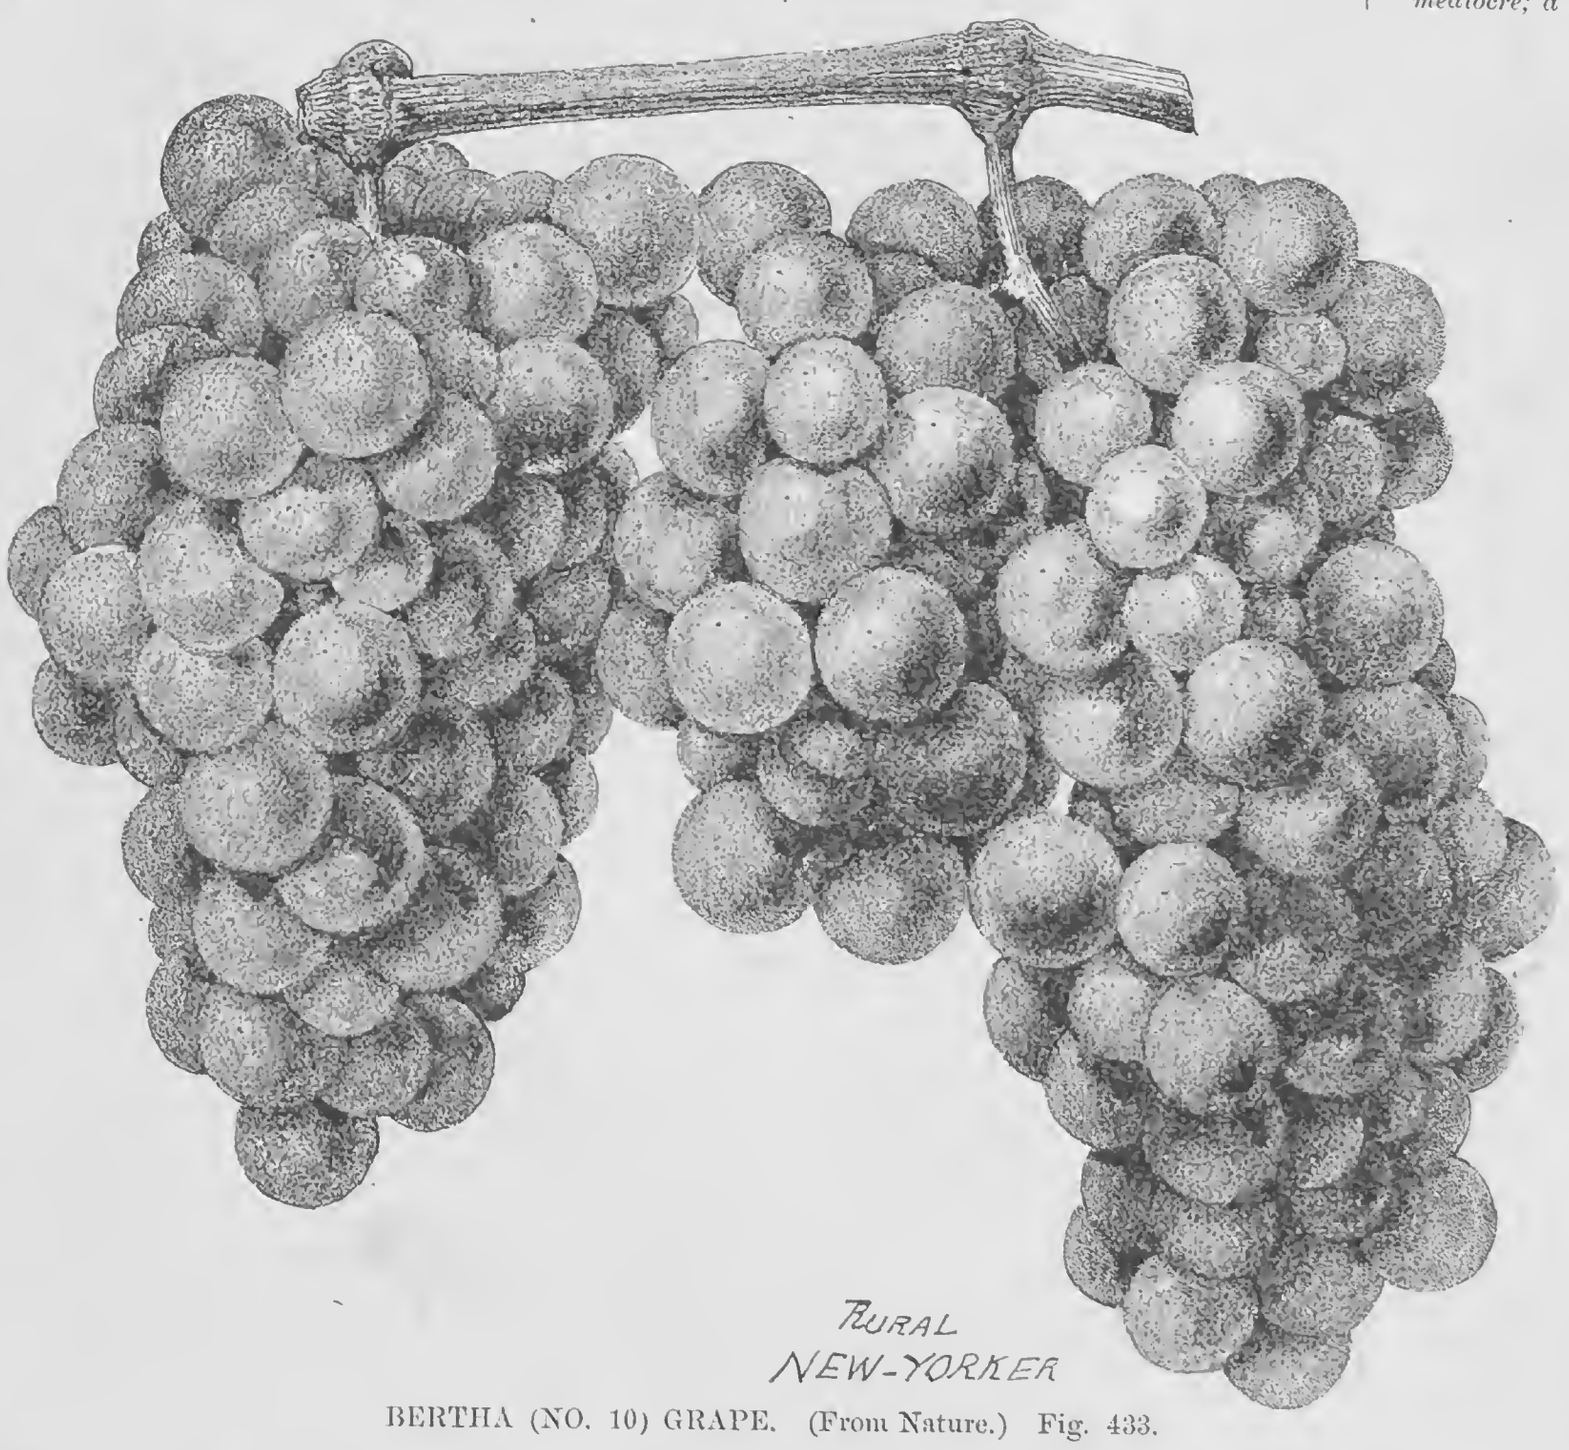
Providence Co., R. I. C. T. KEITH.

ALICANTE GRAPE.

PRES. P. BARRY.

THIS variety has long been cultivated in European collections. Like most other popular sorts, it has a long list of synonyms—Dr. Hogg, in his Fruit Manual, gives 10 or 12. It is supposed to be of Spanish origin, but the history of its introduction seems to be in obscurity. A few years ago it was brought prominently before the public by W. Meredith, of the Garston Vineyard, near Liverpool, England. He had at one time, when I visited there, entire houses filled with this sort, bearing enormous crops. This gave it a start in popularity. I had my vine from that establishment. The variety was then called "Meredith's Alicante" to distinguish it from others bearing the name Alicante.

It is a large, handsome, oval black grape of not more than second quality, but valued for its free fruiting and good keeping qualities. In England it is largely grown for market. I have three vines in my cold grapery, and they never fail to give a heavy crop. A little heat to finish the ripening, would no doubt improve the quality. The bunch is broad-shouldered, compact and large to very large, weighing from two to four pounds, according to treatment, and it is a superb grape and easily grown—a pity the quality is not better.



BERTHA (NO. 10) GRAPE. (From Nature.) Fig. 433.

Floricultural.

THE NEW YORK CHRYSANTHEMUM SHOW.

(RURAL SPECIAL REPORT.)

Show held too early; general effect not striking; new Chrysanthemum Mrs. Cleveland; old favorites; new seedlings; designs mediocre; a petty extortion; the Pompon Class; other classes; orchids; a moderate success.

THIS year the New York Horticultural Society secured a fairly good place for their exhibition, giving a better opportunity for sightseers and exhibitors alike. Cosmopolitan Hall is not without its disadvantages, but it is immeasurably superior to the melancholy structure where the last show was held, and the excellent concerts daily were an additional attraction to many.

Unfortunately, the show was fixed for an earlier date than last year, while the season is much later; so many of the plants were not really sufficiently advanced for exhibition. This disadvantage made the display of cut flowers better than that of plants, since it is always possible to find odd blooms in perfection, when the effect of the entire plant would be poor.

On entering the hall, the first attraction was a table of cut flowers, for the most part remarkably fine specimens of old varieties. This table had a back-ground of evergreens, cutting off any view of the interior, where the mass of plants was displayed. Although the arrangement was good, the general effect of the hall was not striking on first entry: it was too much on a level, so that it could hardly be appreciated except from the balcony. There was a good backing of evergreens and autumn leaves on each side shutting off the space beneath the balconies.

The central group of plants was the finest, containing such old favorites as, Golden Gloire de Rayonnante, Gloriosum, Golden Dragon, and a whole gamut of other yellows from sulphur to deep brouzy buff, relieved by silvery Brise du Matin or snowy Jeanne d' Arc.

On a pedestal in the center of this mass was a vase containing the much-praised new seedling, Mrs. Cleveland. It was veiled in feathery adiantum, and patriotically draped with a tri-colored sash; but the flower itself is disappointing. It is a narrow-petaled, greenish-white Japanese seedling from President Cleveland, which we all admired at the last show. It is not nearly so handsome as the parent plant, and being narrow and scant of petals the general appearance is distinctly

scraggy. Some of our floricultural writers have been praising this flower so much in anticipation as the coming chrysanthemum, that a great many were disappointed by it; probably the taking name has much to do with its transient popularity.

Groups of bushes and standards were massed down the sides of the hall, with an occasional palm, the shining green foliage making an artistic break in the poly-chromatic blossoms. The standards were appropriately placed at the back, so that their tall heads showed above the shorter bushes; standing alone they have a painfully artificial aspect, like plants on stilts. In the Japanese section Admiration attracted much favorable comment; it is a beautiful clear-pink, without the aniline shade usually seen in this flower.

All our old favorites were there, of course—Hero of Magdala, with its rich crimson, shaded by bronze Kata Kanka, and all the myriad golden shades, relieved by purest white. Of the new seedlings Silver Chalice is perhaps the most characteristic. It is a Japanese, with snowy petals curving up cup-like from a yellow center. Thorpe Junior is another good seedling, long, golden-yellow petals coming from a daisy-like center. Margaret Thorpe, also new, has curving petals, crimson on one side and buff underneath. The finest uncut flowers were of course on disbudded plants, consisting of one melancholy stem supporting a single flower, all the vigor of the plant having gone into the one blossom; the result was surpassingly fine, viewed as a flower; the plant itself could hardly be admired.

The exhibition of designs was small and of noticeably poor quality from an artistic standpoint. There were some vases and baskets, some screens and what we suppose to have been intended for a center-piece. In most cases the makers fell into a very common error—they used light, feathery ferns for drapery, when foliage with this flower should always be of a heavier quality. Delicate leaves make the flower look coarse, and the arrangement seems patchy. The screens for the most part showed this mistake; the solid groundwork of crysanthemums craped with feathery adiantum was ungraceful, to say the least. One panel, however, showed a better arrangement. The background was of crimson liquidamber leaves, and on this was a trailing spray of white crysanthemums with their own foliage. Another panel showed careful and clever work, having a solid backing of yellow flowers, with a Japanese pagoda worked on it in red; but though the good workmanship gave it the look of a real Japanese screen it could hardly be recommended from a floral standpoint.

At one end of the hall was a detachment from the Japanese village, consisting of two rooms furnished, or rather unfurnished, in the Japanese style, where two neat, sleek-haired little orientals painted chrysanthemums on satin, with much dexterity and despatch. These were always surrounded by interested sightseers.

One feature of this exhibition, which caused much dissatisfaction, was the substitution of numbers for the names of the plants. Instead of the unbotanical but flower-loving public being able to ascertain in a moment the name of any favorite, there was a tedious reference to the catalogue, as at a picture gallery, and as people are very apt to pick up a number, and then carelessly put it down again on the wrong plant, the name was often a matter of uncertainty. The catalogue appeared to have been hurriedly compiled, and showed the work of a very poor proof-reader, and as the lithographed cover was calculated to give an artist a pain in the eye it was scarcely a success in any particular. Many people were inclined to grumble at having to pay for these catalogues: it seemed the general impression that they should have been given away like the programmes.

The exhibition in the Pompon class—Chusan Daisies, as they were formerly called—was not so good as last year, as few of the plants were sufficiently opened. The single-flowered specimens were good. This class—the old-fashioned artemisias—receives more attention now; for a few years they were cast in the shade by variations of the double form. The "three little maids from school" were there—Ynm-Yum, Pitti-Sing and Peep-Bo—while the odd, red-rayed Ko-Ko mounted guard over them. The anemone-flowered class, too, was well represented, though it is usually more noticeable for oddity than beauty

It is almost impossible to give a list of the best flowers; it would read like a page from a nurseryman's catalogue. Last year I made a list of the very best flowers seen at three exhibitions, and it numbered 200 and odd varieties, all of remarkable beauty.

Taken as a whole, the late New York exhibition was not so fine as some preceding ones, inasmuch as the plants were not so fine individually. But the great quantity of plants present, varied by occasional palms and evergreens draped with Bittersweet, made a showy and striking interior, and after the long and tedious judging was over, the plants were rearranged with a much better effect than at first.

In addition to the chrysanthemums there were a few orchid flowers and nepenthes, which always excite much admiration, and some blooms of Mr. Evan's new white rose, the Puritan. The delicious tea fragrance of this flower will always prove attractive, whatever its other qualities may be. Taken all round, the show may be counted a success in spite of a fair share of defects, and the conception and carrying out of such an enterprise bespeak both energy on the part of the society, and interest on the part of the public.

EMILY LOUISE TAPLIN.

Farm Topics.

CORRESPONDENTS' VIEWS.

NO SALT FOR CABBAGES.—We used salt on our cabbages in diluted form this season with poor results. We do a large business with one of the wholesale grocery firms in New York. They ship us their codfish (salted) skins and backbones. We made a compost heap of them and after letting them lie a year, used them on cabbage. The plants had to be replanted twice, and then only about 15 per cent. lived. The few that lived were a little better than the average. Salt, we think, killed the plants. SCUDDER & TOWNSEND.

Queens Co., N. Y.

UNWISE TAXATION.—There seems to be something unfair in the way improvements are taxed. If I paint my house and barns, put a lawn in front of my house, plant shrubs and flowers or dig out a lake and surround it with trees, my taxes are at once raised. The more I add to the beauty of my home, the higher they assess my property. In many cases this increase is entirely out of proportion. It is so great, in fact, that many think they will make money by neglecting improvements, and either put their money in the bank or store it up-stairs where the taxes won't eat it up. There is very little inducement in this system to fix things up, and miserly farmers are quick to take advantage of it. V. J. K.

Bergen Co., N. J.

PROTECTION AT RAILROAD CROSSINGS.—The frequent killing of farmers and their employés, to say nothing of the still more frequent killing of horses and stock at railway crossings, should attract more attention than it does. It is astonishing how reports of accidents of this kind are hushed up, being seldom heard of outside of the locality where they occur. There are few railroad crossings where one or more farmers or hired men have not been killed, and it is high time something was done to stop this wholesale and unnecessary slaughter. In all large towns gates are provided, but at country crossings there is usually no protection or warning except the whistle. In these days of electric alarms, there is no reason why a bell should not be kept ringing continuously at every crossing while the train is dangerously near, or, what would be better yet, there should be a gate or folding bar worked automatically by the weight of the train. Unfortunately the railroad companies usually escape paying damages on the plea of contributory negligence if the whistle is blown or the bell rung. A law which would compel the railroad companies to pay damages in all cases of loss of life or property at regular crossings would soon force them to adopt some life-saving device. In the meantime, there is a chance for our inventors to devise an automatic gate or bar which can be operated by a train as it approaches a crossing. J. H. G.

Queens Co., N. Y.

R. N.-Y.—This is a timely subject. Some crossings are located at the side of a hill or near a bend in the track, so that it is impossible to see the on-coming train. Many farmers are careless in the matter. Some market-men driving into New York during the night, fasten the lines to the seat and go to sleep: The horses walk on, crossing several railroad tracks on their journey.

SLAUGHTERING GAME.—On the first day of legal hunting, November 1, I counted no less than 76 men and boys out with dogs and guns. Very few of them came back empty-handed. There was a tremendous slaughter of quail. The law is well respected. Copies of the game laws are posted in all conspicuous places and a society has been organized to protect game. Special fees are given to informers and extra watchfulness is encouraged. It would be a fine thing if the Legislature would pass a law to protect game for five years. Let them do entirely away with the present short shooting season, and give the game a chance to increase. There would be better shooting to pay for it.

Bergen Co., N. J. H. J. J.

R. N.-Y.—But wouldn't the crops suffer? One of the greatest grievances of English tenant farmers is due to the great injury done to their crops under the game laws. Where these are strictly enforced, and game is not thinned out by sportsmen for a few years, the losses of the farmers are often disastrous. Quail, woodcock, partridges, etc., are always harmless, but rabbits, etc., do much harm.

LET THE BOYS HAVE SOME FUN.—People still wonder why boys want to leave the farm and try the fortunes of the city. There is little wonder in it when the matter is looked into. Too little effort is made to make the homes, from which boys want to run away, attractive. The almighty dollar gets in the way. How many boys are governed as they should be? Boys are not wild animals. They do not need pounding because they do not do their work as well as an older person. They have not had experience. How much could you get for a young colt that had no more life and spirit than a horse of 20 years? The trouble is that too many farmers have too much to say about big "I" in talking to their boys. Why not say "we" or "ours" in talking about the farm or the stock, and encourage the boys to say the same. They will learn to take an interest. Subscribe for the paper in their name, and if there is something a little extra in stock or vegetables, let them take it to the fair. You can get along just as well if you do drop a little importance. Boys like a little fun now and then, and they ought to have a play day. When work gets a little crowding and they try to have a little sport what good does it do to scold and growl? Put in a word yourself; the work will go off all the easier to pay for it. Never mind if they throw a nubbin of corn at one another. It won't hurt you; it wouldn't hurt you to throw one yourself. Don't think so much of your dignity. A little fun will oil up the joints of your life and make it run easier. Do anything to make the boys think they are having a pleasant time. A little fun and good nature will go far towards turning work into play. When you get a boy so that he loves his work, he will love his home and his parents, and you will have a strong arm to rest on as you go down the slope of the declining years of life. The time is coming when you won't be the boss that you are now. Your treatment of your boys now will govern their treatment of you then. O. T. H.

Bath, N. Y.

WASTED PASTURES are frequent throughout the West. They are ruined by poor judgment in running cattle and hogs over them. Can we not find some better method in feeding cattle at pasture? My observations are confined to farms which feed, say, 40 hogs and a dozen neat cattle. I have seen many a splendid pasture that could sustain that much stock destroyed in a single season. I saw eight hogs fed from May 1 to October, from such a small patch of clover that I was astonished. These hogs were fed from small shoats till they were of great size, and that by a boy who cut the clover, carried it to them three times per day, and kept at school too. At the same time I saw where only a few more hogs had eaten down and totally ruined by November several acres of what would have been splendid pasture if left alone and cut carefully. I consider that the waste made by such pasturing and the careless feeding of corn will offset all we can make. Custom and prejudice are at the bottom of it. Time and the circulation of such papers as the RURAL may correct matters. Who can suggest a better remedy.

Oregon, Mo. C. I.

Farm Economy.

RECUPERATIVE AGRICULTURE.

(FIRST ARTICLE.)

PROFESSOR I. P. ROBERTS.

A change of system or a foresting of worn-out land necessary; unproductiveness of much land at present; permanent pastures and sheep; dogs must go; need of stock food not grown on the farm; transformation of crude plant food; fertility retained in droppings.

How to restore a sufficient portion of the original fertility of impoverished fields so that their occupancy and culture may be fairly remunerative while improving them, is a problem that requires careful consideration. Through ignorance, carelessness and greed, many once fairly fertile acres have been so far impoverished as to preclude profitable cultivation now or hereafter, if the same systems that robbed them are persisted in. If this be so, a change of some sort becomes necessary if we preserve for cultivation the lands that have once been brought under subjection by the plow. There is much land so steep or rocky, or naturally so poor and of such narrow capabilities that it should be given over to the growth of forest trees, or to Nature's slow but sure methods of soil improvement.

It is not my purpose, at the present time, to speak of lands which, under any management, would prove unprofitable if kept under tillage, but of those which in time can be so far improved as to make their cultivation profitable. Neither is it my purpose to give details, instructive of improving the land, except so far as may be necessary to explain and emphasize certain principles, as environments always control, to a large extent, the means used to accomplish our ends.

A large amount of our cultivated land—I believe fully one-half—is not producing, under present management, over 10 bushels of wheat or its equivalent in other products, per acre; and over an eighth—to put it mildly—is not producing over half that much. Although my readers may not agree with my estimates, they must admit that the income from thousands upon tens of thousands of acres is so small that it is insufficient to give even European starvation wages to the farmer. If land will not give fair wages and a profit under tillage, then it should be permanently seeded to grass and clover. Why spend the equivalent of a dollar for the pleasure of receiving in return 95 cents. A field well set in grass will improve rapidly in fertility if all the manure that the animals produce that consume the grass, and a reasonable amount of bran and other like by-products, be returned to it. Of all domestic animals, sheep are best suited to improve poor lands. They graze closely, which causes the grass to tiller and cover bare spots. They eat nearly all species of weeds and brambles. They pack and level the surface of the land without poaching it. They usually lie at night on the high land, thus leaving their droppings largely where most needed. They furnish the best and most convenient means of securing fresh, cheap, healthful meat at all seasons of the year. There are the *dogs!* Yes; I know, but the dogs must go. Shall a great and profitable industry be destroyed because there is a superabundance of worthless, mangy curs? A good gun and the law will soon drive them out of any locality.

There are many acres especially in the South, where even Bermuda Grass could get but a feeble footing at first—places where the grass would sustain but one sheep per acre. Under such circumstances the animals should receive a liberal supply of bran, cotton-seed or sorghum-seed meal, at least some food not produced on the land to be improved. But this you say is robbing Peter to pay Paul. In some cases it may be; but it is not necessarily so. There are vast and inexhaustable stores of plant food in and upon the earth, which are either going to waste or inert and valueless to the farmer in their present condition. It is the province of improved agriculture to seize upon crude and cheap material and through the aid of plant and animal transform it into merchantable food and clothing. The phosphoric acid found in the rock and bone for which is paid eight cents per pound, will be found in the milk, a thousand pounds of which contain:

1.5 pounds potash.
1.7 " phosphoric acid
5.1 " nitrogen

The total cost of the above in the form of fertilizers would be one dollar; in solution in milk they sell readily for from $10 and $40. Then, why not purchase more liberally of the crude, cheap products; mix them with brain and muscle and sell at these advanced prices. A ton of bran, costing $14 with us this season, furnishes, in round numbers:

Nitrogen	41 pounds.
Potash	28 "
Phosphoric acid	54 "

If fed to sheep not less than 80 per cent. of these valuable constituents would be found in their droppings, as follows:

Nitrogen, 35 pounds @ $ .16	$5.60
Potash, 22 " " .04	.88
Phosphoric acid, 43 pounds at .03	3.44
	$9.92

If we take some other products, as cotton-seed meal, the showing will be still better. There is not the slightest doubt that the surest and cheapest way to profitably improve poor land is to seed it down even with weeds of the least harmful sorts, if it will not grow grass at first, and then supplement the pasture with other food.

(*Concluded next week.*)

DEVICES FOR GATHERING FOREST LEAVES.

LEAVES are exceedingly rich in fertilizing matter. Leaf mold makes the richest soil and is made expressly by gardeners by heaping leaves in piles to decompose, for use in their greenhouses and forcing beds, also for potted plants. They are, therefore, valuable for use in stables and yards for litter, and this not only for their manurial value, but because they are the softest, warmest and cleanest

bedding that can be procured. This is the season when they should be gathered in abundance and stored for use during the Winter. They will thus become an excellent substitute for straw and leave this for use as fodder, along with some meal and bran, which will make it as good as hay.

For gathering leaves one wants a heavy rake with strong, wooden teeth, and a head three feet long. This is necessary to resist the snags and brush in the woods. A peculiar and very effective contrivance for taking up the leaves is made of two light poles four or five feet long, having a sheet of common bagging, four feet wide, stitched to them as here shown (Fig. 439).

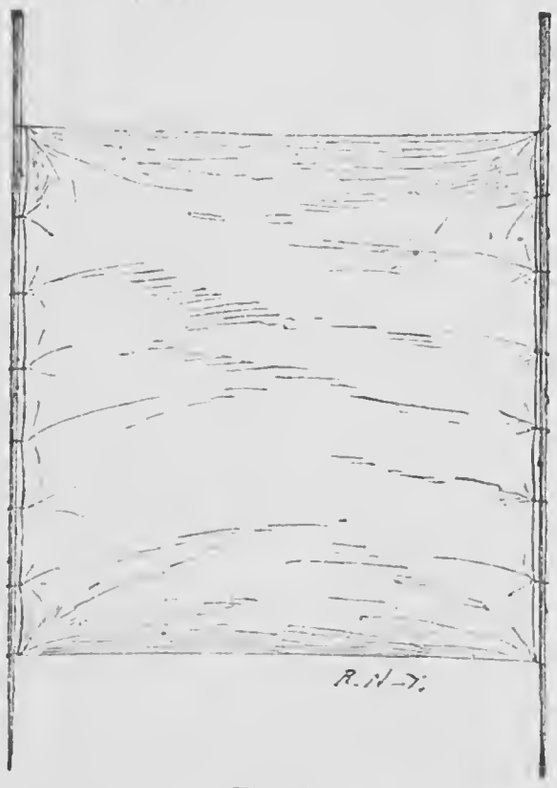


Fig. 439.

The leaves are raked up in heaps; this sack grip, or grip-sack, as it might be called, is turned down over the heap; the handles are brought together, gathering a lot of the leaves, and these are lifted up and emptied into the rack or the wagon. Another contrivance is made of a light hoop-pole about 12 feet long, or a light hickory rod, to which a piece of bagging is fastened loosely, so as to make a sort of basket (See Fig. 440). A large

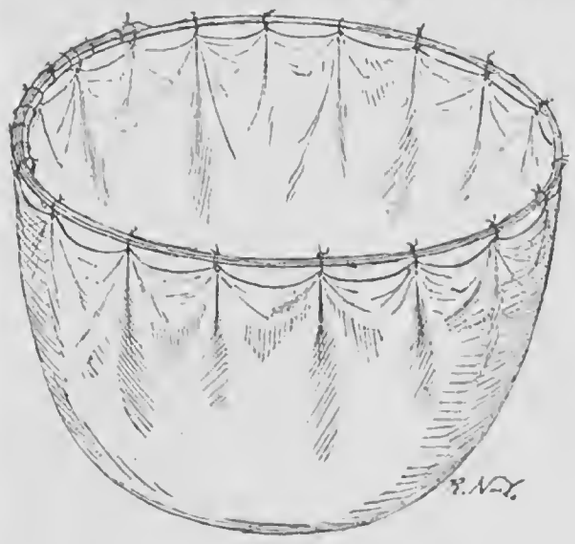

Fig. 440.

quantity of leaves may be picked up with one of these, laid on the ground and the leaves raked in a large pile on it. Several bushels may be taken up at once with this leaf lifter.

Rural Topics.

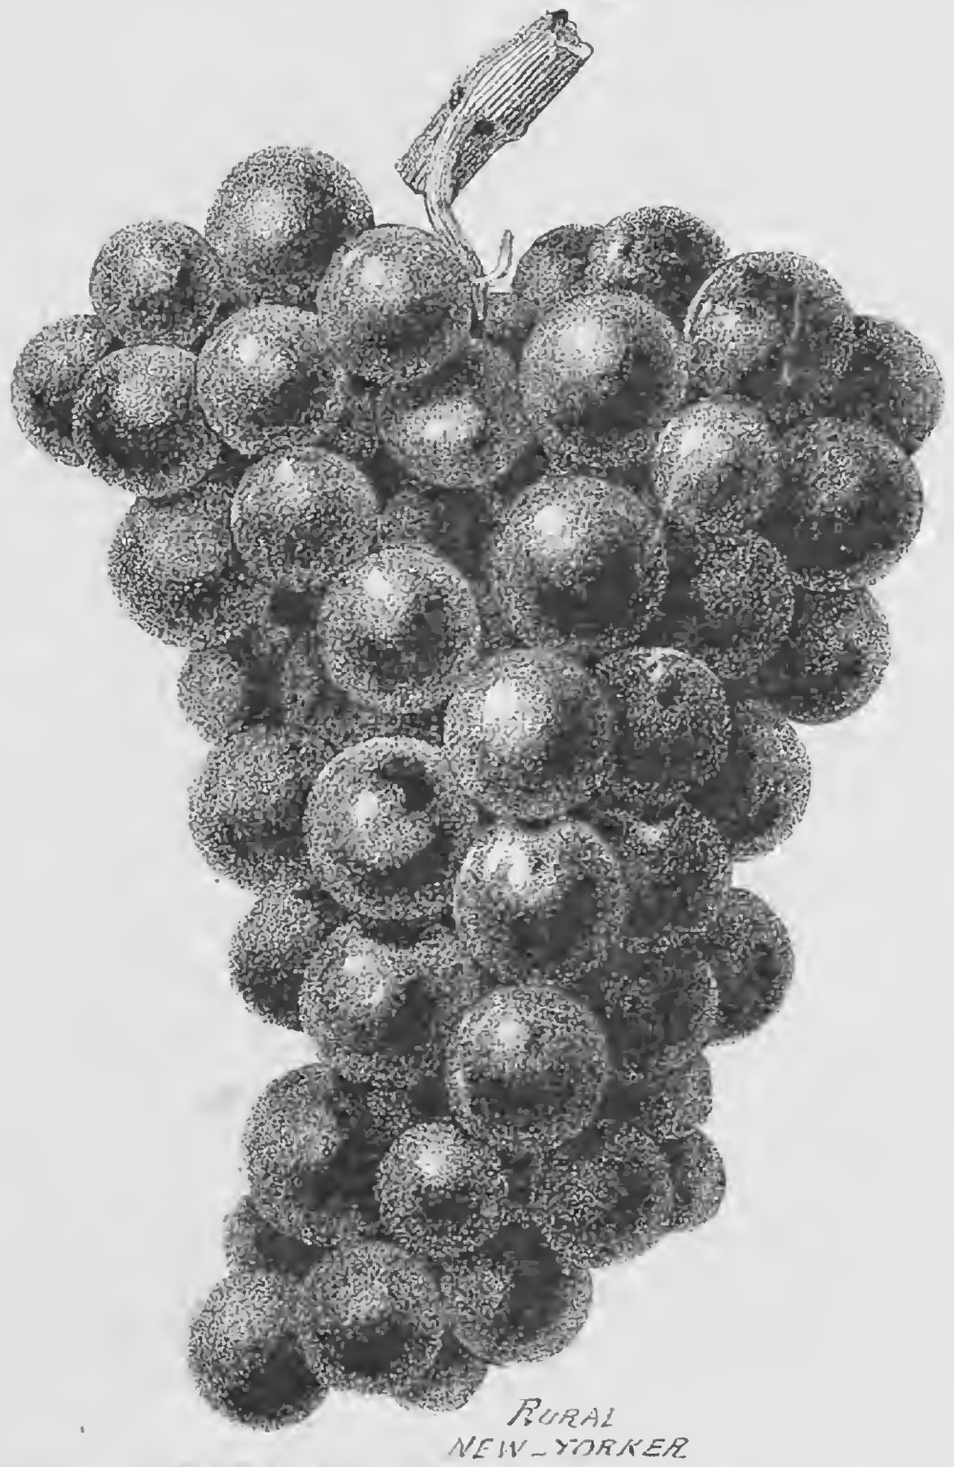
RUMINATION.

HENRY STEWART.

DEHORNING CATTLE.—Mr. Haaff, in the RURAL of Oct. 30, rides his hobby on this subject too hard. Dishorning cattle is a painful process. When he writes as he does so incorrectly about horns, intelligent persons will lose confidence in his judgment. Any book on anatomy gives a clear description of the horn of an ox, and shows that the inner core of it is a continuation of the frontal sinus, and is lined with the periosteum, a most sensitive membrane and full of nerves and blood-vessels. Further, when he says if the horn is cut above a certain point the animal will bleed to death, but will not if cut lower down, he states an absurdity, for there can be no blood above a point if there is no artery below it. Cutting with a saw prevents bleeding because it tears and does not divide the blood vessels smoothly.

MILKING EWES.—When I was at Roquefort 25 years ago, I saw a good deal of cows' milk made into the celebrated cheese of that place, and the keeping of ewes for the milk has been gradually falling off as less profitable than keeping cows. The New Zealanders will be going backwards if they go to keeping ewes for making cheese.

THE HORNS OF THE DEVONS are a serious objection to this excellent breed. Long and sharp as daggers, the owner of a Devon is always on the brink of sudden death from these weapons. I kept Devons once, but a young cow once turned upon my wife, who was petting her calf, threw her down and thrust the long, sharp horns completely through her clothing, tearing the skin quite across the breast. It was done in an instant, and but for a hay fork standing near by both my wife and I would have fallen victims to those "cruel horns." If Mr. Haaff would adopt the practice of dehorning young calves before the horns are grown—a simple operation—I will aid him as far as I can.



JOHN A. WARDER GRAPE. From Nature. Fig. 434. (See first page.)

MARIE LOUISE GRAPE. From Nature. Fig. 435. (See first page.)

A GREEN CROP FOR FOWLS.—It is an excellent plan to have a yard sown with some green crop for the fowls; but why take it from them and give it to the cows? A flock of hens are as valuable as a cow, if not more so, and should be equally well cared for. The plan of having two yards for a flock and each sown with a green crop alternately, I believe was first introduced by me, and I found it indispensable when my flocks numbered nearly a thousand in all.

ENSILAGE—Sir J. B. Lawes has done American farmers invaluable service by his occasional contributions to the pages of the RURAL, the first American paper for which he ever wrote. The summary of the Rothamsted experiments with ensilage given on page 721, puts this subject in a very clear light. We can understand how all vegetable substance suffers loss during fermentation in the silo. What we want to know quite as much is what changes occur in the curing of hay and corn fodder, that we cannot get equally good butter and cheese as from the green fodder.

WHEN TO SPREAD MANURE.—Dr. Hoskins is always sound, and his statement that animal excrements are never worth any more than when they are fresh from the animal, is sound common sense and fact, and should stop the flow of the abundant nonsense written about the increased value of litter and manure by decomposition. If this could happen something could be got for nothing; and the chemical action of decomposition—which is a force, because heat is developed by it—would occur without any cause that could produce it. It is of great importance that this fact stated by Dr. Hoskins should be clearly understood by every farmer.

THE MUZZLING OF DOGS is a safe and reasonable practice, and should be universally adopted. I have a large flock of sheep which require my care day and night to preserve them from roaming dogs. I have lost 20 the past Summer, without counting the injury to the others by the chasing and fright. If one of my sheep should trespass on my neighbor's field or garden, there would be a howl of disapprobation; hence I keep the flock inside of safe fences. But when my neighbors' dogs trespass upon my pastures and kill and mangle my sheep it is considered a matter of course. If a man will keep a dog, why should he not be compelled by law to keep him on his own premises. If this were done, there would be an end of the dog nuisance, and the owner could have all the hydrophobia to himself.

MR. BAXTER'S six-pound sweet potato, dug in Kansas, is a poor thing compared with a crop I have seen taken up in North Carolina: where a heap of 30 or 40 bushels of selected potatoes were all over six pounds each, and some weighed more than eight pounds.

Macon Co., N. C.

Dairy Husbandry.

CONVENTION OF THE NATIONAL BUTTER, CHEESE AND EGG ASSOCIATION.

(RURAL SPECIAL REPORT.)

THE Thirteenth Annual Convention of the National Butter, Cheese and Egg Association closed on the 12th instant, in D Battery, Chicago, after a three days' session. The first day was devoted to the reception of delegates, from the leading cities of the country, at the Columbia Theatre, speeches of welcome from the President of the Board of Trade, President of the Produce Exchange, who presided, Governor of the State, Mayor of the city, an address from Hon. W. H. Hatch, of Missouri, and the annual address of the President of the association on taking the chair for business. Instead of a regular newspaper report it will be more satisfactory to report by topics and so boil the whole down into a few paragraphs.

BOGUS BUTTER.

This topic was introduced by Mayor Harrison, who declared himself a butterine man because he is a Chicagoan, and called butterine the poor man's butter. This fell like a wet blanket over his hearers, and a voice twice shouted "No," while he responded "Yes, Chicago has the floor." Hon. William H. Hatch, of Missouri, declared that bogus butter "is not the poor man's friend, but the rich man's fraud." He had eaten more dry bread in the last two years than in all his previous life, because he was afraid when he dined at hotels, restaurants and in dining cars, that some of the abominable compound would be smuggled down his throat. He did not touch the so-called butter in Chicago. It is safe to say that consumption has in this way been greatly reduced, as the writer and thousands of others share in the repugnance of Mr. Hatch to the bogus stuff. In fact, no one of any refinement or sensibility will knowingly eat it. The sentiment of the convention was strong against it, and the determination was expressed to see that the national statute is enforced, and any needed amendments to render it more efficient be demanded of Congress. A committee of three from each State was provided for to secure State legislation against the manufacture of bogus butter "in semblance or imitation" of the genuine, as in New York. Mr. Hatch declared there is not the least danger of the present Congress repealing or doing any thing to weaken the present national law; that its constitutionality is undoubted, and the law will be found stronger before the end of the first year than either the dairymen or bogus butter men are aware. He thinks that only a small amount of the counterfeit article will be sold, and that almost wholly to caterers for restaurants, hotels, boarding-houses, steamboats and dining

cars. Hence the need of State legislation to directly protect consumers who may be imposed upon through these channels. The principal revenue receipts from bogus butter will be confined to the licenses of the first quarter of the year's enforcement of the national statute. Congress was called upon for an immediate appropriation to enforce the law.

CHEESE.

THE President in his opening address denounced skimmed and adulterated cheese as one of the worst evils of the dairy business. It has greatly lessened the home consumption of cheese as the stuff is not only indigestible, but unpalatable. Mr. Seymour, of New York, was convinced that if the dairymen would give our home consumers none but the best whole-milk cheese, the consumption would be doubled in five years. A State brand for full cream cheese, like that provided by the State of New York, was recommended by the convention. The superiority of Canada cheese was referred to, when the writer explained that it is due to the fact that the Canadians use the sweet-curd process introduced by Prof. L. B. Arnold which consists in drawing the whey sweet, keeping up the temperature of the curd, and developing the acid out of the whey. In this way, there is no danger of sour cheese, nor of cutting out the phosphates and fats with acid, since only a very small per cent. of the sugar remains in the curd and will not develop acid enough to do any injury. Failure on the part of those who condemn the sweet-curd process comes from too great a hurry to put the curd to press after the whey is drawn, and not holding it a sufficient length of time for the development of acid and the rennet action to take place. When this is done, a rich, mellow and firm, but never a hard and dry or sour cheese is the result.

BUTTER.

The best form of package for butter was declared by a vote of the convention to be tin, covered with a wooden jacket. There is complaint of a "woody flavor," caused by contact of the butter with the wood. This arises mainly from the laziness and neglect of the dairyman to properly soak and scald the tub and then saturate it with brine, and partly from the use of bitter or other bad-flavored woods in making tubs. The only objection raised against tin is the ease with which it bruises, which is remedied by the wooden jackets, and the possibility of the generation of chloride of tin, which is poisonous, from the contact of the salt or brine with the tin. Only one case of this kind had been heard of, while in years of practice in canning and sending butter to South America no complaint has been heard. The fact that the United States Government has butter put up in tin cans for long sea voyages was referred to as evidence that no serious results follow the action of the salt on the tin. Salt is a very common and very stable compound, and in all probability the combination is not likely to be broken by the attraction of the chlorine for the tin, or of the sodium for the fats of the butter, especially when the air is excluded. Objections were made to the use of paraffine, or of paraffined paper, a cotton cloth to cover the package being preferred. Tin is more liable to oxydation, but the smearing of grease protects it in this respect. One member called attention to the fact that if two tin pails, exactly alike, were filled, one with brine and the other with soft water, the one filled with water would be first attacked by oxygen and suffer the most.

COLORING.

The president expressed the opinion in his address that people are generally becoming aware that coloring butter and cheese adds nothing to improve their quality, and that it might be proper to discuss the question of abandoning coloring, especially as this is one of the chief means of successful counterfeiting. It is a fact worth observing that the only foreign ingredient, of modern origin, used by dairymen, should afford the most efficient aid to the counterfeiters of dairy products. Coloring, aside from appearance, can do no possible good, and theoretically is objectionable. It enables the maker of inferior goods to give them the hue of the finest. He may half starve his cows and make naturally a butter as pale as it is poor, but by the use of color he is enabled to deceive his customer as to appearance. Abolish coloring, and leave all butter to be sold for just what it is, and what it appears to be, and the dairyman would be compelled to keep up the color, if it is kept up, by keeping his cows in good thriving condition and giving them the best food for butter production. He could not conceal the condition of his herd behind the bottle of prepared coloring fluid. Although the convention took no action, and favored the toleration of coloring by the dairyman, while opposing it in the manufacture of imitation butter, it nevertheless might be in the interest of honesty and progress to abolish the practice of coloring altogether. Butter and cheese may as well wear their natural garb as any other article of food, and honesty in food products and manufactures is a desideratum of the times.

HONESTY AND QUALITY.

The writer read a paper in which he insisted upon strict honesty on the part of the dairyman, and the keeping up of the quality of his product by using the best salt, the best coloring—if any—and doing the best work possible. Any inferiority is an aid to the bogus butter manufacturer by lowering the standard. By keeping up the quality, imitation is rendered more difficult, confidence is established on the part of the consumer, consumption is increased, and thereby prices are enhanced. The rage for cheapness, the desire to obtain goods for less than they are worth, regardless of equity or the rights of the laborer, is demoralizing all branches of industry and rendering the moral atmosphere as corrupt as the commercial, and full of violence and danger. In the end, the farmer has nothing to gain by dishonesty, and of all classes can afford to remain honest through all temptations and mutations. If his industry is corrupt, it demoralizes all the industries resting upon it. Some day it will be found that "the god of cheapness is also the god of deceit and swindling." A national anti-adulteration law is demanded by the exigencies of the times. It is time all the necessaries of life were honestly exhibited and sold for just what they are. If mankind would try it for a while, they would find that honesty is the best policy.

EGGS.

Which is the best package for eggs—the barrel or the case or box? The barrel seems to be preferred in New York, because of the system of delivery by express, which makes it cost no more for a barrel than for a box containing half the number of eggs. The smaller markets of Boston, Philadelphia and other cities appear to prefer the box or case. The suggestion that egg packages be returned was voted down as too laborious and expensive for the receiver. Although feasible in other cities, it is not so in New York, and the judgment was against shipping eggs in second-hand and more or less damaged packages. It appeared to be conceded that the barrel is not so good to keep eggs in, the center being specially liable to injury; so that boxes are preferable where they can be used with satisfaction to the customer. President Winsor specially protested against keeping eggs in cold storage, as they are liable to get musty and so quickly spoil when removed to a higher temperature. It is better to give them to the customer as fresh as possible. He had no objection to liming eggs, which is a philosophically correct practice, and could not see the justice of holding limed eggs at a low price. For all cooking purposes, they are just as good as new-laid eggs. It is only when boiled that the objectionable flavor appears.

PRESERVING BUTTER.

Mr. Tower, of Michigan, described a process of melting newly-churned butter before salting, and raising it to a temperature of 120 degrees Fahrenheit, where it is held until all the caseous matter is precipitated and the lighter matter has risen as a scum. The latter is taken off and the oil run into ice water. At a temperature of 55 degrees it is packed in tubs, being put in by layers and the salt sprinkled on and worked in only by the use of the packer. The tub is headed, filled with brine through a hole, and then plugged up and set away in a cool place, where it is claimed it will keep for an indefinite period. It has no flavor or taste of butter, all the flavoring oils being expelled. In this way, the butter is kept until the market is satisfactory. Then it is raised to a temperature of 110 degrees, emulsified with skimmed milk, and thus made into a cream. This is treated the same as natural cream, the development of lactic acid being depended upon to give flavor. We thus have a good quality of oleomargarine made out of clean and wholesome material. This is all that can be claimed for the product.

OFFICERS.

A representative creameryman, H. B. Gurler, of De Kalb, Ill., President of the Illinois Dairymen's Association, was unanimously chosen President for the ensuing year, and Col. R. M. Littler, Secretary of the Chicago Produce Exchange, was unanimously re-elected Secretary and Treasurer.

T. D. CURTIS.

THE USE OF ICE IN THE DAIRY.

FIVE of the 300-word essays on butter-making, contributed to the management of the Iowa State Fair have been published. They are unanimous about the first most important requisites—good butter-cows well fed; partially with grain feed. Cleanliness of the cows, milkers, milk and cream comes in next. Not one says a word about the necessity of aerating the cream; but all insist upon the frequent stirring of it, and especially if new cream is added. All insist upon frequent churning, and aerating the cream when churning. Part of them recommend the use of ice-water to keep the butter in granules till the salting is effected. Only one betrayed a lack of information when giving the advice, "Keep ice out of milk and cream." Many a factory has been saved from great losses by using ice to cool the cream both in and out of the churn. While it is true that plenty of ice-water in which to keep the pails, and into which to wash the butter will do good, yet it is just as true that milk is not harmed by being poured directly upon ice; and cream can be mixed with it when needful to do so; and to my certain knowledge a perfect article and a long-keeping butter can be made by the "direct ice process." It is a mistake to hold that pure ice, rightly used, is damaging to milk, cream or butter. Millions of dollars' worth of all three "go to the bad" every year for the want of it. If people would get old-fogy notions out of their heads, and put up more ice and use it in butter-making, and in keeping milk over-night for the cheese factories, they would save money that is now wasted. "BADGER."

The Poultry Yard.

MODE OF VENTILATING A HENNERY.

THE device shown at Fig. 438 is an excellent one for heating and ventilating a medium-sized hen house. It consists of a piece of,

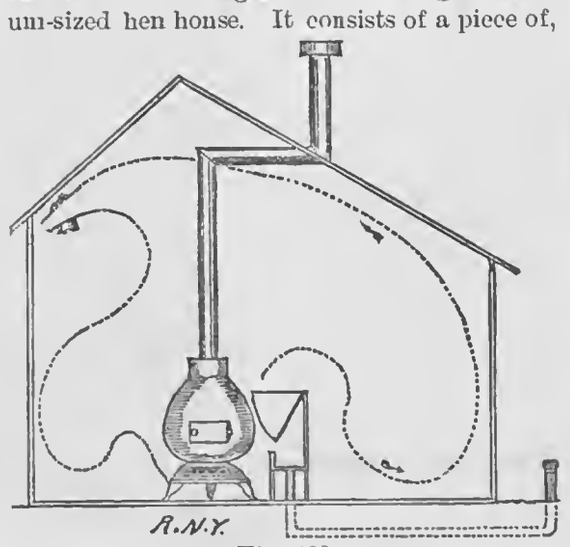


Fig. 438.

say, three-inch iron pipe running underground from the chicken house to the open air, so arranged that the cold and pure air comes out directly against the heated stove, passing upward as it becomes heated, and, finally, escaping from a circular, or other form of ventilator placed near the roof. The end of the pipe should be a few inches above the surface of the ground and covered with a sieve, to prevent the entrance of sand and dirt. The box should be so arranged as to admit the cold air directly on the stove, and should have a lid so arranged as to regulate the quantity admitted. The ventilator at the top of the hen house may be arranged in almost any way, so that it permits the escape of the foul air. This device will secure a uniform temperature and a free circulation of warm and pure air. It is the invention of Mr. Bates, of East Rockaway, L. I., and is not patented. It can be adapted to almost any hen house by almost any one, and at a trifling cost.

The Apiarian.

NORTH AMERICAN BEE KEEPERS' ASSOCIATION.

RURAL SPECIAL REPORT CONTINUED.

Wintering bees; causes of winter losses; proper food and temperature paramount requisites; brood raising; feeding bees in Winter; curtailment of drone production; hiving swarms; how to limit drone production; the use of foundation.

DR. A. R. MASON, of Ohio, read an essay upon "Wintering Bees." The following are extracts:—The first question that would naturally be asked is, what is the cause of our winter losses? All kinds of causes are mentioned, such as cold, confinement, too much and not enough moisture, excess of ventilation and want of ventilation, brood rearing, bad honey, starvation, pollen, lack of hibernation, etc., but nearly all the bees lost have dysentery, and it is pretty generally admitted that this is the great cause of winter loss. The next question, then, would be, what is the cause of bee-diarrhœa? The answer to this is not so unanimous. That it is the result of an over-loading of the intestines but few will deny. Poor honey in the hive may, but does not always produce it. The same is true of pollen, but diarrhœa is so seldom produced without pollen that the exceptions need hardly be taken into consideration.

Many things might be named as aids in successful wintering; but all may be included in two—proper food and right temperature. Proper food is first in importance, and may consist of either honey or sugar sirup, or both, and may, or may not, include bee-bread. If it is desired to have brood-rearing going on before the bees can gather pollen in the Spring, then it must be included in the winter stores. Many successful bee-keepers say they do not want their bees to rear broods until they can gather pollen from natural flowers in the Spring; but my own experience satisfies me that I can get a much larger yield of honey from a colony that commences to breed in January or February than I can from one that does not.

Second only to proper food is right temperature. I have had the best results with a temperature of about 45°, during the first part of the Winter, and until brood-rearing begins. From this time on, I prefer a higher temperature, gradually increasing to about 55°. A damp repository requires a higher temperature than a dry one. The bees should be placed in the cellar as soon as cold weather has become settled, which, in Northern Ohio is usually about November 15th. An essay by James McNeill of New York, was read entitled "Feeding Bees for Winter," in which he defended the practice of wintering bees upon stores of sugar. There is no safer, or cheaper, food for bees during the Winter than pure cane sugar. Its use has been objected to upon the ground that honey is thereby cheapened, but the essayist asserted that all improvements had produced the same result.

W. Z. Hutchison, of Michigan, read an essay on "Drones and Drone Comb" in which he took the ground that the only important function performed by drones is that of fecundating queens. The bees rear drones only when they are needed, or soon will be needed, for the fertilization of queens, and when there is no further need for them in this direction the workers either kill them or drive them from the hive. It costs honey and the time of nurse bees to rear drones, hence their production should be curtailed. It may be asked why do bees rear so many drones if their only use is the fertilization of queens? Nature is always very prodigal in all matters pertaining to the certainty of reproduction, and we can often step in and interfere to an advantage. A few dozen drones to each hive are sufficient. We have, and very properly too, paid a great deal of attention to the rearing of queens; while the drones have been reared hap-hazard. The breeders of stock well know that prepotency is on the male side, and work accordingly. We may some time be able to control the mating of queens; until then, the best we can do is to control the production of drones in inferior or ordinary stock, and rear large quantities of them and in the best possible manner, in superior colonies.

Mr. Hutchinson had, for four years, practised hiving swarms upon empty frames, allowing the bees to build their own combs in the brood nest; and had found it profitable. Since he had written upon the subject, others had adopted the plan. Some had succeeded, while others complained that the bees built too much drone comb. To prevent this he advised as follows: Do not have the brood chambers larger than five Langstroth frames. Have the frames supplied with "starters" half an inch in width. Place the frames not farther apart than an inch and three-eighths from center to center. Use a queen-excluding honey-board. Have young queens. Remove the supers from the old to the new hive at the time of hiving, adding an extra case of sections next the hive, if necessary to give the bees sufficient room.

Mr. T. F. Bingham, of Michigan, asked why not use full sheets of foundation? Mr. Hutchinson replied that they would soon be drawn into full combs, when honey that would otherwise have been stored in the sections is placed in the brood nest. Mr. Bingham had tried, several times the hiving of bees upon shallow frames, both with and without foundation, and had secured better results by its use. Bees, he said, would occupy an empty brood chamber sooner than they would a super filled with foundations. Mr. H. said that he did not put on supers filled with foundations only when hiving swarms, but moved the supers from the old to the new hives, and the sections in these supers have combs in all stages of development, and the bees are soon back at work upon the very sections they had so hastily deserted.

Mr. O. O. Poppleton, of Iowa, had attended the Iowa State Bee-keepers' Association a few days previous, and this question had there been discussed, and five-sixths of those who spoke upon the subject favored the use of foundation, as by its use more honey had been secured and the production of drone comb controlled. Mr. P. thought the success of Mr.

H. might be attributable to his location; for example, the flow might be slow. Mr. Hutchinson said he knew that he and some others succeeded, and he had given all the reasons he could think of why he succeeded, but he was aware that there might be other reasons, and the one mentioned by Mr. P. was a fair one for consideration.

The following officers were elected: President, C. C. Miller, Marengo, Ill.; Secretary, W. Z. Hutchinson, Rogersville, Mich.; Treasurer, Chas. F. Muth, Cincinnati, O.

The next annual meeting will be held in Chicago, Ill., in the Fall of 1887.

Genesee Co., Mich. W. Z. HUTCHINSON.

Pomological.

THE IDAHO PEAR.

On October 26, we received from Mr. John H. Evans, Lewiston, Idaho, some specimens of the pear illustrated at Fig. 436, with a cross section at Fig. 437. Mr. Evans writes us that the tree grows in the orchard of Mrs. Mulkey, of the above town, which is in the same latitude as Quebec, though the climate there is warmer. About 18 to 19 years ago four seeds were saved from a fine, large, oblong pear resembling the Bartlett. All were planted, but only one germinated, making a growth of about two feet the first year. It grew so thriftily, with such fine foliage, that it was resolved not to bud it. Next Spring it was transplanted, and four years from the seed bore some fine fruit, and has continued bearing ever since. It is about a month later and keeps better than the Bartlett, and is thought by all who know both to be fully its equal in all other respects. When received here, the fruit was in color a bright golden-yellow, with a red cheek covered with dots a little darker in hue. Others were more oblong but all were about as large at the apex or stem end as at the base or calyx end. There is no pear of this shape that we know of. It more nearly resembles an oblong apple in shape than any pear. It is a most remarkable, beautiful distinct pear, which must have a future. It has never been our fortune to have a new fruit sent to us which strikes us so favorably as this.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

EMPIRE CITY MILL.—Catalogue from A. Richard, 110 John Street, New York City. It is claimed that this mill requires less attention and less power, and will do more and better work than any other iron mill in the market. We have seen the mill in operation, run by a 16-foot Dana wind-mill, and with a fair wind it will grind from 12 to 15 bushels of corn per hour. The perfection of the feed-mill so that it can be run by wind-power and grind all the feed required by the average farmer is a matter of great importance, and will go far toward solving the problem of feeding farm produce in the most economical way. If, with no greater power than a 16-foot windmill or a 2-horse tread-power, a small-sized, low-priced iron feed-mill will grind in an hour feed enough to last a good-sized herd several days, there is no excuse for a farmer if he does not grind such grain as can be best utilized as ground feed. The Empire City Mill would seem to combine all the good qualities of the older mills, with several important improvements. Parties having power would do well to make a trial of these mills.

IMPERIAL EGG FOOD Circular from F. C. Sturtevant, Hartford, Conn.—The trade mark of this food represents a hen standing beside a pile of eggs, several times larger than she is. This pile of eggs is supposed to be her work—the result of the Imperial Egg Food. This picture well shows what is claimed for the food. We have never used anything of the kind ourselves, and cannot state from actual experiment anything as to its merits. Messrs. Felch, Knapp, Hawkins, and others prominent in the poultry business, praise this food without reserve. Knapp Bros., who ought to be good authority, say they would not go through the moulting season or fall and winter months without it.

MAGIC FEED MILL. Circular from the Whitman Agricultural Co., St. Louis, Mo. It is claimed that the "magic" of this mill consists in its ability to do a large amount of work with a small amount of power. It is guaranteed to grind 30 bushels of feed in an hour with a two-horse railway power. Each mill is provided with two sets of steel grinders. One is for grinding feed for stock and the other for fine family flour. These grinders can be quickly changed. One set will grind 2,000 bushels or more. It is claimed that the meal comes from this mill cool, hence no danger from souring or heating. A Junior Magic mill is made for a family grist mill.

SCROLL SAWS, LATHES, FANCY WOODS, ETC. Catalogue from A. H. Pomeroy, 216-220 Asylum Street, Hartford, Conn.—This is a well-printed pamphlet of 35 pages in which the various articles manufactured by this firm are well described. We know that these scroll saws are excellent. We have offered them as premiums with great satisfaction to our agents. Nothing could be finer for a present to a boy with a mechanical turn of mind than one of these saws. The catalogue is filled with pictures of knives, drills and other useful tools. Those who need good, well-made tools will do well to send to headquarters for them. Send for the catalogue and look it over.

KNABE PIANOS. Catalogue of Grand, Cabinet and Square Pianos, manufactured by Wm. Knabe & Co., Baltimore, Md.—This catalogue contains fine illustrations of the celebrated pianos made by this firm, and also a brief statement of the origin of the firm and the success it has attained during the 50 years of its existence. It is claimed for the Knabe pianos that they unite every advantage of the best pianos manufactured. The high character and responsibility of the firm make it desirable for any one wishing to purchase an instrument to write for prices and terms.

FARMERS' POULTRY RAISING GUIDE. I. S. Johnson & Co., Boston.—In noticing this pamphlet a few weeks since, a mistake was made. The pamphlet is not intended for free circulation. It costs 25 cents.

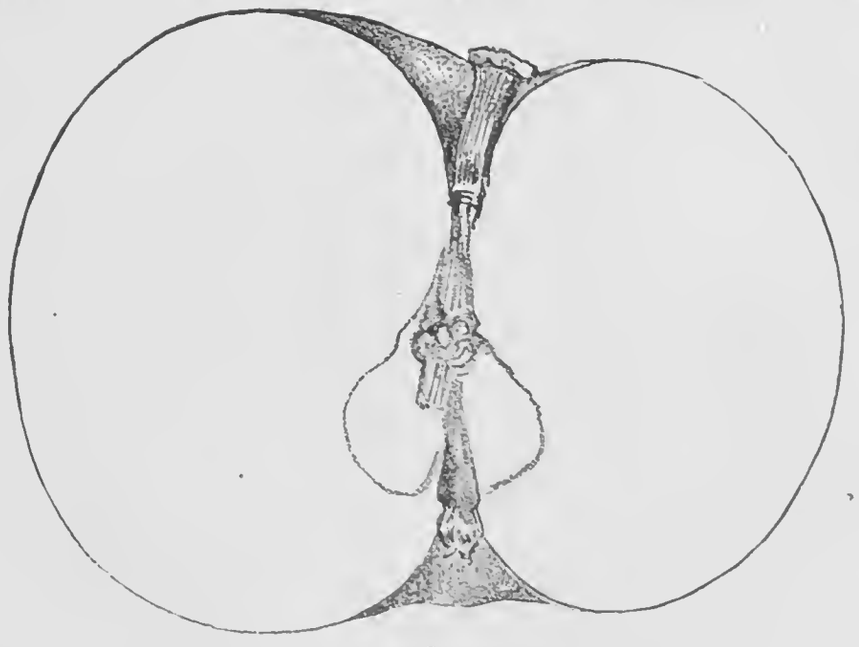
IDAHO PEAR. From Nature. Fig. 436.



R. N-Y.

IDAHO PEAR. Cross Section. Fig. 437.

What Others Say.

A NEW DISINFECTANT.—The stalls at the recent Horse Show in this city, were exceedingly clean. There was no offensive odor perceptible. This result was largely due to the care exercised by those in charge, but the new disinfectant, "Sanitas," is attracting considerable attention just now, and bids fair to become popular. It was brought out by Mr. Kingzett, an English chemist. He remarked the peculiar healthfulness of pine forests, and sought to discover the cause. He satisfied himself that the healthy atmosphere of a pine wood is due to the presence of peroxide of hydrogen and camphoraceous substances produced by the atmospheric oxidation of the essential oils secreted by those trees, and that these valuable natural purifiers can be produced from common turpentine. The study then was to reduce this "forest balm" to such a condition that it can be brought into practical use in neutralizing the foul odors in unclean places. A large quantity of turpentine, floating on water, is exposed to a hot blast of air—much the same as molten iron is in the Bessemer "converter"—with the effect of producing a watery solution, composed of peroxide of hydrogen, camphoric acid, camphor, thymol, etc., and an oxidized oil, containing a great quantity of camphoric peroxide. In the crude form, these products, known as "Sanitas" make a cheap disinfectant. The oil is volatile at a low temperature and is an excellent air purifier, producing an atmosphere much like that in the pine forest. It is also said to form an excellent insecticide and liquid soap or sheep dip.

IMPROVEMENT IN POULTRY SHOWS.—We find the following in the Poultry Keeper: "Recently the following item appeared in the RURAL NEW-YORKER, which in our judgment is very interesting to the rank and file, and which is a move long advocated by us. It said:

> The time has arrived when the poultry shows and agricultural associations should recognize true merit. A scale of points should be arranged for judging not only the living market fowls, but the dressed carcasses and encouragement should, with those objects in view, be given to the crossing of the different breeds.

To which Mr. Harker in the Poultry Bulletin replied as follows:

> This is an old cry, but the fact is no one takes any interest in cross-bred mongrels and dressed dead poultry. Time and again have special and regular prizes been offered to call out such displays at poultry shows, with absolutely no competition resulting therefrom. If comparatively few people will come to see a grand show of beautiful blooded fowls, how many would visit a collection of cross-bred market poultry? It strikes us that it is just as easy to improve our pure bred poultry as it is to make better mongrels, and a deal more sensible.

If Brother Harker will stop and consider he will recall the fact that those great millions of figures he sometimes displays are due to the business in "cross-bred mongrels and dressed dead poultry." What does he mean by improving the thorough-bred poultry. It is to give one-third the points to head, feet, earlobes, and wattles—useless parts. Yes, we want better mongrels, and they may be competed for at the shows if given a chance. The present standard does not improve anything. It is not even plain English."

THE CHIEF OF THE INTERNAL REVENUE BUREAU ON OLEO.—In closing his report the other day Commissioner Miller of the Internal Revenue Bureau reviews the action taken by him for the enforcement of the Oleomargarine Bill, and says:

> It is impossible at this time to estimate the amount of internal revenue which will be derived from oleomargarine. If, however, the operation of the law should prove unsatisfactory in its present form, which is construed to levy a tax only upon the article manufactured and sold or removed for consumption or sale as suppositious butter, the law can be so amended as, while imposing a tax upon oleomargarine—oil, neutral oil, and such like substances, without which the suppositious butter cannot be extensively manufactured—to provide also for the use of such substances by subsequent compounders without the payment of a second tax, as rectifiers are allowed to compound distilled spirits on which the tax is paid without paying an additional gallon tax, simply by delivering up the original tax paid stamps and receiving in exchange other stamps representing the same quantity; also for refunding the tax on so much as is used for lubricating purposes or otherwise in the arts and sciences.
>
> In my opinion the advantage in securing the tax from the manufacturer, who derives his material from the slaughtered animals, cannot be overestimated. These manufacturers are comparatively few in number. By requiring them to stamp and brand all their productions and to keep such books as will indicate the destination of their products, such products can be followed to the dealers and through the dealers to the consumers.
>
> At the same time, by the use of a system of exchanging stamps similar to that now in operation as to distilled spirits, the article may be readily identified by the consumer without necessitating the imposition of a second tax.

SUNFLOWER RAISING UNPROFITABLE.—There is a manifest tendency in many quarters to boom the sunflower as profitable for poultry feeding. Mr. O. S. Bliss says, in the N. Y. Tribune, that it is a gross feeder, each plant requiring as much room as a hill of corn, producing nothing of value but a few seeds. It is like raising a hog for its bristles. He would not underrate the value of the seeds. He always wants a few old ones for his old hens at moulting time, and a few for any ailing fowl in Winter. He thinks they are almost a specific for sundry ailments and weaknesses. It is the most difficult of all crops to save and cure. Long before they are ripe enough to harvest, the birds begin to get the seeds. When harvested the heads are so full of water that if they touch one another they are sure to rot. Mr. Bliss further states that the stalks are a nuisance all Winter and have to be gathered up and burned in the Spring. They may in some places be worth something for fuel, but if a man can earn 50 cents a day he can better afford to buy wood at $8 a cord than spend time fitting them for the stove. There is no profit in raising the sunflower.

SCALDING FEED.—The London Live Stock Journal tells of the practice of a feeder who objects to turnips and yet wants to take something of the "dryness" out of his feed. A water-tight trough, or box, 12x2x2½ feet, is filled with chopped hay and straw, which are mixed with grain and meal. It is then well scalded with boiling water. The lid is then shut down and the mixture is allowed to ferment for about 10 hours, a new mess being put in as soon as the old one is taken out. Such food is both succulent and digestible, and the results were not belied in the pail. There is nothing new about this plan, but there is much good in it.

GRAIN GRADING AT BUFFALO.—The opening of two new elevators at Buffalo, connecting with all the railways centering there, in which 820,000 bushels of grain may be stored in bulk and graded, opens up some possibilities in the way of speculation at the Buffalo Merchants' Exchange, which have not hitherto been enjoyed. The railway grain business at Buffalo is declared by the Commercial to have been neglected heretofore. It is also pointed out that "the issuance of negotiable warehouse receipts will greatly facilitate option trading; in short, it will place Buffalo on an equality with Chicago, Milwaukee and New York as regards the speculative features of the grain business."

WASHINGTON TERRITORY DEVELOPMENT.—In the report made by the Governor of Washington Territory to the Interior Department at Washington the writer refers honefully to the growing products of the Territory. There are now in operation 450 miles of railway, and this leads him to call attention to the fact that a number of the roads have not earned the lands which have been granted to them, and he recommends that the same be forfeited. He is anxious that Washington Territory be admitted to the Union, a privilege which he claims for her increased population and importance as a commonwealth.

WIND AS A SEED CARRIER.—Prof. Alfred Russell Wallace speaks of the fact that some species of plants which have a wide distribution in the Southern Hemisphere are also common plants of the North. There are from 50 to 60 species in New Zealand and the same number in Australia and Patagonia, which are identified with those of northern latitudes. Five causes of distribution of seeds are prominent: 1, sea currents; 2, birds eating fruits the seeds of which, after digestion, are found to be widely distributed; 3, seeds of marsh plants, being in the mud which adheres to the

feet of wading birds, are carried long distances; 4, sticky seeds which attach themselves to the feathers of birds; and, 5, the agency of the wind. The latter is considered most effective. Dust particles from the Java eruption, of greater weight than many seeds, were found on the decks of vessels 1,000 miles distant at sea. The plants introduced were mostly light-seeded ones. Prof. Wallace estimated that if a single seed per square mile of territory were deposited once per hundred years, it would be sufficient to keep up the stock and to maintain the purity of the species.

THE ST. LOUIS STOCK-YARDS SCHEME.—A movement is on foot by the International Range Association to establish a large cattle-yard at St. Louis. The object, it is said, is to overcome the alleged monopoly resulting from the combinations between the stock-yards and dressed-beef men in Chicago, which is stated to include the stock-yards in East St. Louis, Chicago, Kansas City and Denver. The proposed yards at St. Louis will be controlled by the rangemen, with close relations, however, between them and commission men.

FULL AS A TICK.

PUCK says that some of the New York dailies publish their flood-tide circulation. If they would also publish their ebb-tide circulation, the public would be amazed at the mighty flow between. .....

OUR friendly contemporary the Canadian Horticulturist, says that the Marlboro Raspberry, which was so highly puffed some time ago, is now set down by many as not bearing out its good reputation, especially after the first two or three seasons. .....

WE see that the Iowa State Agricultural College (Ames) has 305 students, male and female. The total number of graduates is 323. No charge is made for tuition to Iowa students; to those from other States only $15.00 per term. All other charges are extremely moderate. The catalogue for 1886 is now ready...

ONE of the interesting novelties of which we read is the Spaulding Curculio-proof Plum. This is said not to belong to the Chickasaw species and to offer some resistance to the curculio on account of its thick skin, but for some reason the egg of this horrible little creature fails to hatch and so there is no grub or larva to work any mischief. The female makes a mistake and deposits her egg in a bad place. The Spaulding it seems is a close relative of the Green Gage, Lombard, etc. It is claimed to be very productive, a remarkable grower, with leathery, large leaves, ripening its fruit in late August.....

"LIFE" says that a great deal of the poorest "copy" in a newspaper office comes from professional contributors.....

DR. HOLMES says that nobody can do anything to make his neighbors wiser or better without being liable to abuse for it.....He also says that he finds the great thing in this world is not so much where we stand, as in what direction we are moving. To reach the port of Heaven, we must sail sometimes with the wind and sometimes against it,—but we must sail, and not drift, or lie at anchor.....

THE N. E. Farmer, so much improved under its present publisher, says that many farmers grow strawberries for home use by "hits and starts" as it were. After considerable teasing by other members of the household a few strawberry plants or raspberry bushes are purchased or begged from a neighbor, and planted in the garden. They are well cared for till one crop of fruit is taken and greatly enjoyed. But no provision is made for crops every year. The old beds get full of weeds and finally the plants are all dead, and nice berries on the table are things only in memory . .....

THE most skillful poultryman that we know of provides his hen-houses with perches nearly three inches wide, slightly oval or rounded on the upper surface. They are only 18 inches from the floor.....

IT was intended, says the American Garden, that our Department of Agriculture should test new varieties and tell us what to buy; but the seed business has developed into an entirely different thing—an electioneering instrument, antagonistic to seedsmen and growers rather than helpful to them.....

OUR Champion Quince this year bore as usual a large quantity of fruit, no larger than Rea's Mammoth or the Orange, and later. It will be remembed that the R. N.-Y. was sharply criticized for its comments upon this quince in past years. But a longer trial shows that we did it no injustice. In some parts of the South this quince is preferred to the older kinds. As to Meech's Prolific, everything that we have said regarding it is about correct

J. T. Lovett, of Little Silver, N. J., advertises the Japan Giant Chestnut. He says that trees but three years planted bore abundantly, and that *some* of the burrs contained six large chestnuts. "Many clear-headed farmers are planting it largely for profit."....

Our friend, Sec. E. Williams, a careful and conscientious horticulturist, tells the Weekly Press that the berries of the Worden are invariably larger than those of the Concord, the clusters generally longer and the quality better—sweeter and more juicy. It generally ripens before Concord, but varies in this respect. He hardly thinks it will supersede the Concord as a market grape, because it cracks more easily, having a thinner skin.....

THE cultivation of pecan nuts in the South is said to be profitable, notwithstanding they grow wild in great quantities in Texas and other parts of that section. A correspondent of the Baton Rouge Truth, who says he lost money growing cotton, now declares he is going to get rich from his pecan trees. The Savannah News also records that pecans are being successfully grown in the coast country of Georgia. It is a crop which requires no work after the trees are fairly started, and would be just the thing for a lazy man, who could reap the kindly fruits of the earth without laboring for them.....

AN Illinois farmer sent a quantity of honey to a Chicago commission merchant, and, in order to test the latter's honesty, visited the city and bought his own honey, paying 14 cents a pound for it. When the returns from the consignment came back it was represented that the honey had been sold for 12 cents a pound. This idea need not be altogether thrown away. It might be worth while acting upon it occasionally by those who consign farm produce of various kinds to large markets for sale on commission.....

TESTIMONIALS are cheap things, says the Western Rural. You can buy them at about 50 cents a hundred. Every patent humbug is well supplied with them, and the greater the humbug the more testimonials , ...

A WRITER in the N. Y. World calls attention to the benefit of a good supply of charcoal in fattening turkeys. Two turkeys were fed on meal, boiled potatoes and oats. Two others of the same brood were also at the same time confined in another pen and fed daily on the same food, but with one pint of finely pulverized charcoal mixed with it. They had also a plentiful supply of charcoal in their pen. The four were killed on the same day and there was a difference of one and one-half pound each in favor of the fowls which had been supplied with charcoal, they being much the fattest and the meat being greatly superior.. .. ..

THERE is one crop, suggests Waldo F. Brown in the Farmers' Review, that grows faster in Winter than in Summer—the manure crop..... .. ..

A WRITER in the Cornhill Magazine says that the Moor is expressly commanded to be kind to the horse, but nothing is said about the donkey. As a consequence, the poor donkeys are battered and braised, and are forced to absorb all the ill temper and cruelty their masters possess, while the horses go free. Has anybody noticed anything of this spirit about scrub farmers? Do they hammer their stock at random, or do they pick out a few animals to practice upon? As a rule, the hens are forced to take a good share of the abuse.....

THE Scientific American gives a mode of fire-proofing wood, which may be available for shingles or siding. Soak 27½ parts by weight of sulphate of zinc, 11 of potash, 22 of alum and 11 of manganic oxide in lukewarm water in an iron boiler and gradually add 11 parts by weight of 60 per cent. sulphuric acid. The wood is to be completely covered with this liquid for three hours and then air-dried.....

IN an old book, written some 80 years ago, an account is given of a horse dealer who whipped his horses as a matter of business. It gave them life, as he claimed. When he cracked his whip in the presence of a customer the frightened horses gave every evidence of activity and a desire to get out of the way. He thought he had the same right to whip his horse that any other tradesman had to show off any article to advantage. We would interfere very seriously with such an arrangement in this day..... .. ..

A MULE in California, which had for years had the reputation of being a gentle beast, was terrorized almost to insanity by the smell of blood, from some fresh beef. The Pacific Rural Press says that the mule's sense of smell is as acute as that of a dog. Men who have been engaged in slaughtering should give horses and mules a wide berth until their clothes can be aired or changed.....

DR AMES says that in Montana they generally consider the Holstein-Friesians as their most valuable breed both as milk producers and butter makers. They are of a desirable size for beef. So he states in the Massachusetts Ploughman ....

PROF. HENRY, the Farmers' Review says, dehorned a vicious bull which cared so little about it that in ten minutes after the operation he went to grazing as quietly as if nothing unusual had happened.....

Everywhere.

TRANSCONTINENTAL LETTERS—LXX.

MARY WAGER-FISHER.

The road out of the Grand Canon; the Sphinx; a cliff cave; Westminster Abbey; Temple of Jupiter Ammon; arrival at Peach Spring; the Mojave Indians; arrival at Los Angeles.

IN riding out of the Grand Cañon the road lies for 10 miles between walls which range in hight from 2,2000 feet to 4,800 feet above the road-bed. For reasons, atmospherical and otherwise, this mighty wall which did not particularly impress us on our downward way seemed during the past 24 hours to have grown thousands of feet in hight, and suddenly to have become thronged with enormous undreamed of sculptures. "I don't point out these things going down," explained Farlee, "because so much depends upon the point of observation, and they are all seen to better advantage on the outward ride."

When about four miles from the hotel we were nearly opposite the Sphinx which is 6,000 feet high. The outline of the top of this portion of the left wall, considerably over a mile high, is so curiously like that of the Egyptian Sphinx, as to merit its name. On the right-hand side we noticed a cave well up to the top of the wall—Anaximander remarking that it was not common to see caves in red sandstone rock. Farlee tried our guessing powers in measuring the distance from the top of the wall to the cave, as well as its outward dimensions. In his various investigations in the c ñon, he had at one time with an exploring party, had himself let down from the top of the wall by a rope in front of this cave, and found the distance to be 320 feet, and the entrance to the cave 62 feet high. But his experiment proved what was not visible to the eye—that the top of the wall projected considerably, and when in front of the cave, he was so far removed from it that he was unable to find any means by which he could swing himself into it, so it still remains unexplored. Four miles from the Sphinx is the little pile of rocks called Westminster Abbey—so named by an English woman for its remarkable resemblance to that historic structure,—and it is every whit as beautiful. The real Abbey is overgrown with ivy, while this is draped with vines and pendant grasses growing in the crevices of the rocks, and so arranged as to produce the effect of windows, doors, and exquisite architectural designs.

For some distance before coming to the Abbey, and on the same side of the canoñ my eyes had feasted on what to me was in effect the grandest feature of the Great Wall—of immense hight and size, marvelously sculptured, the facade having a center-piece full of carvings. Farlee said it had never been named and that I had better christen it on the spot! The structure seemed so much more colossal than any name I could muster, that for the nonce we called it the "Great Temple of Jupiter Ammon." On the opposite wall were various groups like sculptured human figures—one had been named "Moses Striking the Rock;" another we called the Profit at Prayer. But over and above all the striking, peculiar features of this tributary of Peach Spring Cañon, the Great Wall itself, on our right, was most impressive; its immensity in every way a mighty breastwork against which all the shot and shell in the world might pelt in vain for centuries.

From nine o'clock until we reached Peach Spring Station, nearly three hours later on, we were sensible of a considerable degree of cold, although well provided with warm cloaks and coats. But not a particle of dew fell, and there was no dampness in the air. However, we enjoyed the brisk wood fire which Farlee had lighted for us in his house, where we were to lodge for the remnant of the night, and in which he had lately fitted up a neat sleeping room for stray tourists. He awoke us next morning at seven o'clock with the announcement that the train was in from the East and that we had half an hour in which to breakfast. As it turned out, the train was held there for several hours, as the road west of the station was blocked with a wrecked car. Meantime, the passengers beguiled the time in making expeditions out upon the foot-hills near by, gathering strange flowers, while the Hualapais Indians, loafing around the train, were quite a source of interest—being made up chiefly of hair, heads and dirt.

From Peach Spring west, to a station called "The Needles," so named for the high, sharp pointed rocks that here abound, the country abounds in cacti, with jagged, picturesque mountains on either side. At The Needles we crossed the Colorado River, and here is the headquarters of the Mojave Indians, who rarely go east of the river, owing to a superstitious belief that if they should die while away from home, they would never be able to join their kindred in the land of the Hereafter. I have seen Indians and Indians—and while the Alaska Indians display more skill and capability than any others, still I have seen none that I liked so well upon a short acquaintance as these Mojaves. The tribe now numbers only two or three hundred—they receive no aid from the Government, and no missionaries have invaded their realm. They wear very little clothing—the little they do wear being chiefly decorative. Their bodies are superb, their teeth of dazzling whiteness, and they display a sense of good humor and affection unusual among red men. They have sun-dried pottery for sale, and the women were not above keeping their pappooses hidden unless paid five cents for showing them! Whenever the trains stopped at the Needles in daylight hours, the Mojaves reaped quite a harvest for their wares, including bows and arrows. They were a happy, gentle-looking race, quite tidy in appearance, although some of the women had their hair bound tight around the head, and then plastered over with a thick coat of clay—this for the purpose of killing the lice in the hair. Indians generally have a great aversion to the barber's art, and, like the Chinese, attach much importance to the hair.

The next morning found us back again at Mojave Junction, where we breakfasted, waited for the overland train from San Francisco, and went speeding southward toward Los Angeles, which city we reached in the middle of the afternoon. Before leaving the Mojave desert we saw a number of mirages—those beautiful but delusive sheets of water that often are seen in deserts. We saw them encircling the mountains which rose out of the apparent water like islands, and the water reflected the masses of color produced by flowers on the mountain slopes. We went through a tunnel 7,000 feet in length cut through the San Raphael Mountains, and while the desert gave way to farming lands, the appearance of the country on to Los Angeles was not attractive. We saw some fields of wheat and grass, some bee ranches, but the country was rugged and broken, with an arid, infertile look for the most part. Once landed in a clean hotel in the City of the Angels, we bathed, dined and went to bed—tired out seven times over, that fifth day of April.

RURAL SPECIAL REPORTS.

Illinois.

CHICAGO, Cook Co., November 16.—Rain is greatly needed in Dakota, in Iowa, and all over Illinois, where, in many places, there has been no rain to amount to anything since last June. It is not quite as dry in Missouri; but Kansas complains, and is crying for water more than any other. Fall plowing has been prosecuted under great difficulties. Wheat lands have not been gotten into order as well as they ought to have been, and my advices from Tennessee and Kentucky as late as Saturday indicate six weeks of dry, clear weather, with not enough moisture in the ground for wheat to sprout. So far, with the exception of Kansas, there does not seem to have been any injury to the growing crop. The opinion is very general that winter wheat ought to have good soaking rains before a general freeze-up takes place. Where the winter wheat crop was the poorest in 1885, there I find that the reserves of the crop of 1886 have been marketed the closest. As fall plowing is now over and as the country roads are good, it is now generally thought that the marketing of wheat will continue free, irrespective of price. The dry weather has proved exceptionally fine for the gathering of corn. Fully two-thirds of the crop has been secured in an unusually fine condition, but farmers do not seem to care to part with their corn with the same degree of freedom as they have their wheat. This side of the Missouri River, in the majority of large corn growing districts, corn is worth for home consumption from three to five cents a bushel more than it will pay to ship to the great grain centers of the country. In Michigan and Ohio the clover and Timothy seed crop is more or less varied in yield; Kansas, Wisconsin, Indiana and Iowa are short, and as the tendency and the demand every Spring by farmers to sow clover for the enrichment of the land is on the increase, we are likely to see a large demand for clover in the Spring. Up to this time the demand in Europe for clover has been practically nothing. The strike at the stock yards has completely fizzled out, but no one has any conception, except those who are directly interested as packers or as contributors to these vast interests as stock growers

and shippers, of the utter demoralization of the meat interests of the Northwest which this strike has made. There were no better fed or paid men in the United States than the men who went out upon the strike in Chicago recently. They have accomplished nothing, have gone back like a lot of whipped curs, and actually produced more financial ruin than they can ever repay as long as they live. N. W.

Montana.

FRIEDLEY, Gallatin Co., November 4, 1886.—Our season is open and fair yet Our cold weather lasts only from the middle of December to the middle of February; at any rate that is my experience so far. The old settlers all claim that the weather has been growing better for everal years, and I tell them it is on account of Eastern men getting in here and thawing them out. Snow is two feet deep now back a few miles in the mountains; but there is none at all on the line of the river bottom land. We have no use at all for sleighs or cutters on the river road even in the Winter time. Crops have been very fair the past season. One neighbor of mine had 1,530 bushels of oats from 14 acres of measured land, and a good many have had over 60 bushels of wheat per acre from large fields of 60 to 100 acres. Potatoes run about 250 bushel to the acre and some run as high as 500 bushels. The largest yield I have known is from the White Elephant first sent out some years ago in the RURAL Free Seed Distribution. I have seen some that weighed as high as 3½ pounds each. Some were sent to New Orleans that weighed over four pounds. They are really elephants in size. I have not tried any for cooking, but those that have them say they are good. Turnips, beets and carrots grow to a monstrous size. I have lots of White Globe Turnips this year that will weigh over 10 pounds each and Rutabagas ditto. B. P. VAN H.

New York.

UTICA, Oneida Co., November 15.—The cheese market was a little slow and several good factories sold completely out. Skims will begin to appear more plentifully soon. Full cream sold Monday at 12 to 12½ cents. Total number of sales 7,338 boxes, ruling at 11½ cents. There will be but three more sale days, the last being December 6. Little Falls sold 3,764 boxes, ruling at 12 cents. There is still plenty of poor stock of butter in market, with slow sales and plenty of this kind offered. Best butter is rare and brings readily 24 and 25 cents; good creamery 26. There were 200 packages brought in last week, for which 22 to 25 cents were paid; bulk at 23 and 24. Still no market for hops, although dealers say a break will come before the holidays. Growers are holding for 25 and 30 cents hops that will eventually have to be sold for 15 to 20. Some hops bought here for 20 cents awhile ago will not bring 12 now. The State crop is in a rather hopeless condition. Choice hops will readily bring 25 to 30 cents, but there are none offered. Most of them rate from poor to fair. R. L.

Virginia.

RICHMOND, Henrico Co., November 15.—There has been rather a better business done this week than last in bright old tobacco wrappers, and the opinion is strengthening that the new crop will be of poor, defective quality, although breaks of new have been too small to fairly test the question. Cutters have again sold well, and it now appears that there is nothing reliable and fine to be had, new or old, under 25 cents, and from this up into the thirties. Fine bright fillers are in better demand, but all medium and common grades are dull. Old dark tobaccoes show no disposition to move, and the market for such is without interesting features. The receipts of new have not yet commenced, and will not perhaps for several weeks yet, when planters will want to sell a little anyhow for Christmas money. The market has not been such lately that tobacco could be handled for market. There is some demand for bright English shipping. T. H. E.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

WINTERING FARROW COWS.

J. G. G., Hornellsville, N. Y.—I have a half dozen young thrifty cows that have failed to get with calf and am offered only $20 for them. I have plenty of coarse fodder, but there is a scarcity of hay. If I sell these cows now I shall have to buy others in Spring to take their places, and if I milk them through the Winter they will give but comparatively little milk next Summer. What course would be most advisable?

ANS.—The best thing you can possibly do with this class of cows is to put them into good warm quarters—so warm that frost will never be seen inside. Feed them all they will eat of a mixture of corn meal three parts, oil meal one part, and bran one part, all by weight. Also give them all the coarse fodder they wish and a moderate feed each day of hay—clover hay if you have it. If you have plenty of roots give each cow from a peck to a half basket of sliced roots daily; if no roots are provided, wet up the provender with hot water 12 hours before feeding, keeping in a comparatively warm place. If you can get three cents or more per quart sell the milk; if not, make gilt-edged butter and send it to some first-class dealer in some large city, using the skim-milk for feeding pigs or last Spring's calves, using, besides, plenty of grain. We think the milk or butter will considerably more than pay for all the feed, and the cows, if crowded as they should be, would sell in Spring for beef at more than twice the price at which they can now be sold, and probably for more than you would have to pay for other cows coming fresh. This gives something to do in the Winter. It keeps on the farm the feed raised there and puts on several tons besides, and if no more, saves at least $20 on each cow, which would be the difference between what you could sell them for now, and what you would have to pay for others next Spring.

BLACKBERRIES.

C. L. Y., Orient, N. Y.—1. What varieties of blackberries would be best for a half acre for home market? 2. Will wild blackberries sell readily at 10 cents a quart for eating and canning purposes? Would it be profitable to raise blackberries for market at that price? 3. I have a few plants already, how can I propagate new plants?

ANS.—1. At present, for your soil and climate, we must select for you the Kittatinny for the most part. If you choose to protect your plants, we should add Early Harvest, because of its earliness and handsome berry. We are not as yet prepared to recommend any of the new kinds. 2. Yes, it would be profitable to raise blackberries to sell at 10 cents per quart; but in many parts of the country during the past season that price could not be obtained. 3. Make root cuttings three inches long and put them in a box, first a layer of sand, then a cutting, etc. Bury the box in a well-drained soil and plant in the Spring. Or you may wait until Spring, and make and plant the cuttings then.

MANURING WHEAT.

J. E., Keokuk, Ia.—I have a piece of wheat which when put in this Fall I was able to manure only in part. The land is clay and sand with a red clay subsoil. The part which was manured before seeding looks much better than that which was not. I also sowed Timothy with the wheat and have a good stand so far. I have on hand and can get for hauling 2½ miles all the coarse stable manure made from horses and cows. I have also about 50 loads of well-rotted manure made from hogs, sheep, horses and cows Would you advise me to draw and spread this manure on now, or if not now, when should it be done, if at all?

ANS.—We should spread after the land is frozen hard. It should be spread very evenly. A clod lying upon a wheat plant will kill it. It may be doubted whether it is well to spread long, coarse manure on wheat plants at all. But the "well rotted manure from hogs" etc., will unquestionably help the wheat if evenly distributed and not so heavily as to smother the plants. We speak from our own experience. In any case our friend should avail himself of the manure at a cost of hauling it 2½ miles. He will never regret it even though half the Winter be given to the work.

YEARLINGS AND UNDER.

C. W. O., Little Hocking, O.—When does a pig cease to be a pig? Can an exhibitor at a fair show three-months-old pigs with hogs, say, one or two pigs with three hogs when the entry says, "four hogs or more." In another case one man had a sow with suckling pigs by her side, and another had three-months-old pigs, and the former claimed that the three-months old pigs were not pigs but hogs.

ANSWERED BY COL. F. D. CURTIS.

With horses, cattle and sheep the young are called yearlings when one year old and under two, and are so recognized by buyers and sellers, and by the rules of agricultural societies. Previous to that age they are called colts, calves and lambs, as the case may be. By the same rule a pig should be called a pig until it is a year old, when it may very properly be denominated a hog. A number of pigs and hogs should be called swine, just as calves, cows, steers and other stock are called cattle, and lambs, ewes and rams are called sheep. It will be improper to class young suckling pigs as hogs, and the same objection would hold for not considering pigs three months old as pigs. Joseph Harris, in his work on swine, preferred to use the word "pig" instead of hog, and on this account mixed the terms, and if his example is followed it will always lead to confusion. We do not have in our American list of words any special ones to denote swine of certain ages, as they do in foreign tongues. The term shote means young hogs in a growing condition. It includes pigs under one year of age, and stands for young store hogs. The latter word applies to any animals kept for moderate growth and designed to be kept through the Winter. It is used in contradistinction to stock intended for more immediate slaughter.

APPLE-TREE-ROOT LICE.

J. W. K., Valley Station, Ky.—I send herewith specimens of apple seedlings from my nursery, which failed to grow, while many have died, involving a heavy loss; what is the cause, and is there a remedy?

ANSWERED BY PROFESSOR A. J. COOK.

On the underground stem, just beneath the earth, are seen on each plant a large number of white, woolly aphides. The insects are Schizoneura lanigera, or apple-root lice. They are easily told by the bluish-white, woolly covering which makes them very conspicuous. They suck at the stem, and are often very harmful to the apple-trees. I have found that all aphides are quick to succumb when treated with the kerosene emulsion. We make it as follows: One quart of soft soap, one gallon of water, all heated to the boiling point, when one pint of kerosene is stirred thoroughly into the mixture. While this kills all plant lice, I have not found it injurious to any plants, or even foliage. In case of these apple-tree-root lice, I would turn the liquid mixture on to the stem just as it enters the earth. It would follow down the roots and kill the lice. There would be no danger of using it too freely. If used in quantity it could be made with little labor.

MAKING CIDER VINEGAR.

M. A. T., Moawequia, Ill.—How should cider vinegar be made?

ANS.—It is always desirable to have some old cider vinegar to start the new. When making vinegar from new cider, in new barrels, pour into each two gallons of old cider vinegar, and laying the barrels on their sides, with the bungs out, fill them only half full with the new cider, which should first be filtered through sand, or strained through flannel strainers. Tack netting over the bung-holes to exclude insects, place the barrels in a sunny spot, and the process of vinegar-making will go on rapidly, so long as the temperature does not fall below 45 degrees. As cold weather approaches, if the acidifying process has been well forwarded, a part of the barrels may be nearly filled from the rest, and placed in the cellar with the bungs loose. In the Spring the vinegar will generally be found fully made. Only *ripe* apples are fit to make vinegar from.

SOCIALIST AND COMMUNIST.

R. H. L., Newark, N. J.—What, if any, is the difference between a Socialist and Communist?

ANS.—Socialism is a theory which advocates a thorough change or reform of the social relations of mankind, and one who advocates this is a Socialist. Communism in theory proposes a similar change by reorganization, and the Communist insists, perhaps a little more strongly than the moderate Socialist, on an absolute community of property. Webster defines communism as socialism, but the general understanding in the use of the two words is that the Communist is a little more radical in his views as to methods, and would effect the change proposed, if need be, by more violent means. "Scratch a Russian and you find a Tartar," said the first Napoleon; and within the fairest exterior of either Socialism or Communism there lurks the spirit of Anarchy ready to express itself in deeds of blood under very little provocation.

Miscellaneous.

W. N. J., Montrose, Colo.—The specimens of barley sent us for name, arrived in such bad order that we could not identify the variety. The Manshury is a strong grower and grows much taller and with a broader, darker leaf than other barley. It has a long, full head, large kernels and on each side of the kernel there is a dark stripe, at least until the grain is fully ripe. It ripens a week at least later than ordinary six-rowed barley. It can now be obtained of most large seedsmen or of H. M. Jacques, Lockport, N. Y.

C. W. G., Canterbury, Conn.—Should Niagara grape-vines be protected here through the Winter? Out of 13 seedlings from the Niagara seed sent me by the RURAL, I saved only one which bore four or five nice but small clusters the past season,

ANS.—Yes, it would be better to protect them. Lay the canes down and hold them there by any sufficient weight. Cover them lightly. A good plan is to lay over them the twigs, etc., from cuttings of trees or evergreens. Your seedling may do better another year. It is never safe to judge of seedling fruit the first bearing year.

W. R. H., Kingston, N. J.—Which is the best time of the year to top-dress sod with commercial fertilizer, to improve the yield of hay?

ANS.—In the Spring. If you could sow it on the snow just before the last thaw, then you would get it about right. If this is not practicable, sow it as early in the Spring as possible.

L. M. H., Newark, Ohio.—What are cotted fleeces?

ANS.—Cotted fleeces as they come to market are more or less closely felted on the sheared side, often the feeling being so solid that it is impossible to separate the fibers, without destroying them. Such fleeces are in a solid piece as if woven. They are known as hard cotts and are intrinsically worth perhaps one-half a healthy fleece of like grade. Soft cotts are such as allow the fibers to be opened without breaking or destroying them.

W. E. B., Washeta, Kans.—What is the standard weight of a bushel of ripe tomatoes, and do the canning factories buy according to this weight?

ANS.—The recognized weight of a bushel of ripe tomatoes is 60 pounds. The canning factories generally pay 25 cents per bushel of this weight.

J. W. R., Barre, Mass.—Is the Victoria an early or late-ripening grape?

ANS.—It ripens at the Rural Grounds just with Concord, or possibly a day or so later.

H. B. C., Rumbelt, Kans.—Law's Farmers' Veterinary Adviser, $3, published by Dr. James Law, Ithaca, N. Y., is probably the best veterinary work of its size extant.

DISCUSSION.

HOW THE RURAL BRANCHING SORGHUM WAS CALLED MILLO MAIZE.

J. H. A., AUGUSTA, Georgia.—A mistake was made in a late RURAL as to the origin of the name "Millo Maize." There was never any one of the name Millo connected with it.

Pratt, a missionary from Honduras, first introduced it into upper S. C. in 1877–8, giving it away under the name of Honduras Corn. I got the seed of Satterthwait, of Aiken, who, I believe supplied the RURAL—that was pedigree seed direct from Pratt's hands. In 1881, Pratt, the missionary, and his brother Chas. Pratt conceived an idea of making money out of the seed, having before that time written of it only as a thing Pratt had given away. They advertised the seed then for the first time as "Millo Maize" at $2.00 per pound, and the Rev. Mr. Pratt explained that "Millo" (Meel-yo) signified "bread" in the native dialect—Bread Corn, the staple food in Honduras. I had also advertised the seed locally at 28 cents per pound, as the seed introduced by the Rev. Mr. Pratt, and did so innocently, ascribing to him full credit for the introduction of it, that being all he claimed or wanted, so far as I had ever heard.

I discovered the Pratts had applied at the Patent Office for registration of the name "Millo Maize" with proprietary rights, excluding others from using that name. I filed my showing and defeated the registration.

Previous to that controversy, the RURAL had the seed, and had named it Rural Branching Sorghum, and I was fully aware of the identity of the RURAL seed with mine and Pratt's, and I set out evidences of that fact at the Patent Office also.

"Millo Maize" was, then, a new name devised by the Pratts with a view to exclude others from the sale of this seed, for their own profit.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING November 20, 1886.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your grocer for Dixon's big cake.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, NOVEMBER 27, 1886.

A QUESTION SUBMITTED TO RURAL READERS FOR DECISION AND A QUESTION WHICH THE RURAL DECIDES FOR ITSELF.

It has been our constant aim—an ever cherished, never satisfied desire—to improve this journal as circumstances permitted, or may permit us to do. Space need not be taken to dwell upon the improvements made during the past 10 years. Old subscribers are familiar with them—while all are chiefly interested in the paper as it is or as it is to be. Respecting the *contents* of the R. N.-Y. for 1887, little need be said. We have no promises to make further than that we shall continue to do our best. During the present ownership of this journal, or since the RURAL NEW-YORKER followed *Moore's* Rural New-Yorker, we have always been decidedly opposed to any reduction in its price. We have been pained to see the price of one farm paper after another drop from a figure already too low, to another at which, as soon as the temporary advantage so gained had ceased, they could not be published without a corresponding reduction in their cost of publication which, of course, means a poorer quality of paper and a lower standard of reading matter. It is a very easy thing to reduce the price of a journal when the cost of publication is for one reason or another very low; but to restore the higher price when the cost of publication increases has generally proven a disastrous experiment. Instead of lowering the subscription price of their publications, we had hoped that the proprietors of farm journals would, during the recent prosperous times, invest their surplus capital in making more instructive, trustworthy and presentable papers, and in *this* way hold or increase their circulation during prosperous times, while elevating the general character of the American farm journal.

Last week our readers doubtless noticed the betterment in the quality of paper, and took for granted that the change was merely a part of a holiday dress-up occasion. The paper was supercalendered. Our present contract for white paper expires in two or three weeks. It is then proposed either to use this supercalendered paper for the future, beginning with the issue of December 10, or else a *heavier* paper, less highly finished, but of equivalent cost. In order to ascertain which kind our readers prefer, several editions of each will be printed—first the supercalendered, then the heavier.

We had nearly determined, without consulting our readers, to use the supercalendered paper—but it was suggested that the gloss might be objectionable to those who have weak eyes or who read at night. It was, therefore, determined to submit the question to a *vote*, and the object of this note is to request all readers after the trial shall have been made (about February 1st) to mail us a postal card on which is to be written either "Plain" or "Gloss." The "election" will settle the question, and thereafter the RURAL will be printed on the paper "elected."

A certain class of readers—those whose ideas of value are reckoned by lowness of price—may *prefer* cheap papers. But the RURAL, while anxious to extend its circulation among all good people, when driven to choose between excellence on the one hand and inferiority or mediocrity on the other, must plainly state that its first and ruling desire is to EXCEL.

MANY thanks to the many friends who have kindly offered to supply the desired back numbers of the RURAL.

WE have received a number of ears of white dent corn—as large and perfect as we have ever seen—without any advice to show by whom they were sent.

TRY the "Superfin" Pear. It ripens in October. It is of fair size and with a sprightly, rich flavor that does not cloy. The flesh is tender, juicy and melting—the tree vigorous.

CHESTER ALAN ARTHUR, twenty-first President of the United States, died at his house on Lexington Avenue in this city at five o'clock Thursday morning, at the age of 56 years, one month and 13 days. A man of kindly nature, true in all relations of life, cordial to his friends, magnanimous to his foes, a faithful citizen and a just, conservative statesman, he won the regard and respect of the whole country which deplores his untimely death. Though a strong Republican, he always displayed great courtesy towards the opposing party, and thus made friends everywhere, and every generous heart in the land can join in respect and sorrow over his grave.

SEC'Y CAMPBELL (Delaware, O.) writes us that he thinks the Empire State Grape will prove one of the best long-keeping varieties, and, of course, be more valuable for that reason. He has been from the first favorably impressed with this grape because of its vigorous growth and healthy foliage; its hardiness and apparent adaptedness to general culture. The only point in which he thinks its introducers have over-stated its merits is in its earliness, which was claimed to be equal to that of the Hartford. With Sec'y Campbell it has not reached what he calls maturity, or its best condition, quite as early as the Concord. The clusters may be allowed to remain on the vine long after the berries are ripe, and instead of deteriorating, they seem to get better. We should be glad to hear from others respecting the Empire State.

ONE of our first grape authorities writes us as follows:

"Do you not think Mr. Lovett is just a little too enthusiastic over the Victoria Grape? I know the RURAL has recommended it, and said many favorable things about it, but to say it is the best white grape yet introduced is hardly warranted; or I should say at least, is not proven."

Yes, we *do* think Mr. Lovett's statement "too enthusiastic." While we are pleased to have our own estimate of the Victoria supported by experienced vineyardists, we are by no means prepared to class it as the "*best* white grape." Hardiness, productiveness and comparative freedom from rot and mildew are the qualities in which we have found the Victoria to excel, and in these respects it has no superior among the varieties at the Rural Grounds. In quality, though less foxy, it is no better than the Concord.

NOT long ago an agricultural college, or rather an agricultural annex of a State university, needed a professor of agriculture. There were many applicants for the position. Among others were several bright young men, graduates at agricultural colleges, full of enthusiasm, eager to make a reputation for honesty and earnestness, and ready to work hard at work with which they were familiar. Were their claims recognized? No; a broken-down politician was put into the place. It was a good hole into which he might retire and draw a comfortable salary. That annex has to-day some half dozen students. It never will have any more until some new blood is let into the institution. If the agricultural college money is to be spent in thus providing a wintering place for political hacks, it is high time that Congress examined into the matter and discovered where the money has gone.

IT would be interesting and instructive to know the weight of the largest ears of corn (flint and dent) in cultivation, and the separate weights of grain and cob. We have just weighed an ear of white dent (thoroughly dry) having 16 rows, 57 kernels to the row, or 913 altogether. The grain weighs 19 ounces, the cob five ounces, the entire ear 24 ounces, or one pound and a half. Length of ear 12½ inches. Average circumference of ear 7¾ inches; of cob 4⅛ inches. It will be seen that the kernel is very deep. The size of the cob is a secondary consideration, provided we have a corresponding *depth* of *kernels closely set*. We should be glad to hear from our readers on this subject. If all who have well-cured ears weighing more than a pound and a half would advise us, we could place the increasing weights before our readers from time to time, and in this way the heaviest weights might be obtained. We will gladly pay $10 each for the heaviest ear of flint and dent as thus determined and present its portrait and give an account of how it was raised, etc.

THE agents of the British Dairy Association, in their efforts to instruct the people in improved dairy methods, have adopted many practices that could well be followed by our own dairymen. The holding of competitive dairy tests is an excellent means of creating an interest. Liberal prizes are offered to those who will make the best butter in the presence of picked judges. Each competitor is furnished with eight quarts of cream, as nearly uniform as possible. Any kind of churn can be used and any method of working or salting employed. The test is held in a hall or tent and a small fee demanded from visitors. The butter is sold at auction to the visitors. Some noted dairy authority closes the exercises with a lecture, and answers questions propounded by the audience. The wives and daughters of farmers are encouraged to enter into the competitions, and it frequently happens that young women high in social position may be seen working the churn or butter worker. This plan has been highly successful. It ought to be introduced at every one of our agricultural exhibitions. A score of pretty young women competing in such a test would prove a stronger attraction for all sensible men than the much-berated horse-track. What society will be the first to put this plan in operation?

THE annual convention of the Farmers' National Alliance, consisting of about 200 delegates, chiefly from Illinois, was held at Chicago the other day. One of the chief points urged upon the attention of the agricultural community was the necessity of organization against encroaching monopolies. Railroad extortion was declared to be one of the principal causes of agricultural distress, and government control of all railroads and other corporations was urged. A graduated income tax; the State control of the police in large cities, and the union of producers of every class in the reform of unjust systems through the ballot-box were advocated. The Secretary's report showed that the Alliance, organized in 1880, had now a total membership of 500,000 and was in good financial condition. The grain buyers' unions were denounced as organizations which fixed their own price for grain in all small towns, controlling the market to the detriment of the producers, and the latter were urged to organize to defeat the combination. An organization backed up by half a million votes should have considerable influence on State and National legislation, and by judicious action and alliance with other agricultural associations could do much to remedy the evils of which it complains and from which a vast majority of the people suffer. These evils will not be amended by mere resolutions, however strongly expressed or often repeated. Why is it that so vast an association, which denounces wrongs so vehemently, does so little at the polls to abolish them?

STANDARD FERTILIZERS.

ONE of our young farmers, a positive, impulsive man, recommended last Spring in very high terms to his neighbors, a chemical fertilizer known as H. B. Griffing's Ammoniated Superphosphate, costing delivered $3.80 per bag or $38.00 per ton. He said that he had tried it beside other high-grade fertilizers costing $44.00 per ton and it gave far better crops. One of our neighbors bought a quantity of it, and, as were talking with him one day in his barn, asked the writer's opinion. So far as we could judge from merely looking at and handling it we were not favorably impressed. At our request the Director of the New Jersey Agricultural Experiment Station sent an agent to River Edge to draw a sample for analysis. The bulletin presenting the Station's analysis is just received. The Station chemist values this fertilizer at $16.07 per ton; that is, the raw material would cost that amount at *retail* prior to mixing, bagging and shipment—a difference as compared with the finished article delivered, of $22.93 per ton.

The farmer who asked our opinion was requested to try, in different plots, the same quantity of this and the $44.00 fertilizer. The trial was made on potatoes. The vines from the higher-priced fertilizer were thriftier from the start and the crop evidently larger, though how much we cannot say, since the hurry of marketing his products prevented the farmer from measuring it. The attention of not less than 20 visitors to the Rural Grounds was called to the two plots and they were requested to say which vines were the thriftier. All at once decided in favor of the $44 fertilizer. We mention this matter somewhat at length in order to show our readers that it is far better to judge for themselves what fertilizers are most economical for them to buy than to accept the "say-so" of any agent or indeed of any farmer who from an imperfect trial concludes that the lower-priced fertilizer of an unknown manufacturer is worth more than the higher-priced article of manufacturers whose goods have been analyzed again and again—always to show that the margin between the selling price and the station valuation is not incompatible with honest dealing. Our readers should always bear in mind that a low-priced fertilizer should analyze higher proportionately than a high-priced fertilizer, to make up for the cost of transportation and spreading which in both cases is the same. We are convinced that the trusty fertilizer firms of the country sell their goods as low as is consistent with a legitimate profit, and the farmer who buys an article at $38 per ton, which is represented as being worth more than a standard article at $44 per ton, will generally find that he has been deceived.

BREVITIES.

BRILLIANT bubble, shining skin;
Can thy gaudy, boastful splendor
Make thee aught but frail and slender,
Hide thy hollowness within?

THE "god of cheapness is also the god of deceit and swindling." See Mr. Curtis's report, page 767.

TURKEYS at 12 cents a pound at retail in the N. Y. market. There is not much money in such prices for the poultrymen.

THE Michigan State Horticultural Society will hold its annual meeting in Grand Rapids, Nov. 30th and Dec. 1st and 2nd. A fine meeting is anticipated. Chas. W. Garfield Secretary.

THE report of the Butter, Cheese and Egg Convention, found on another page, is a model. Reports of such meetings are far more instructive and entertaining when the various topics can be grouped in this way.

YES, there are lots of fine colors; purple, red, yellow, green, blue. And then there are the neutral colors—brown, gray, orange and drab. One costs scarcely more than another, and an agreeable combination of several may help to enliven the house or barn, or both. The choice of colors or combination of colors may, in a degree, show the taste—not to say something of the character—of the owner, as a decided want of any color certainly does.

SECRETARY GEO. W. CAMPBELL writes us that in the many years he has grown and fruited the Worden, it has always colored earlier and ripened earlier than the Concord. There are many Concords growing that are called Wordens—the lower price of Concords affording too strong a temptation for the virtuous tree-peddlers to resist, and both being black grapes of the same general character, many persons, without having genuine Wordens for comparison, "see no difference."

WE take the life of the murderer. We either take it from him in an instant, or grind it out through years of hopeless imprisonment. What is to be done to the man who knowingly adulterates food? There are men who, for the sake of a few dollars profit, are ready to sell food which is charged with slow poisons. The health officials of this city condemn vast quantities of unhealthful food every year. They find it everywhere. They should be upheld in their warfare against disease.

LAST year, Mr. Austin Corbin, president of the Long Island Railroad, distributed a quantity of seed peanuts among the farmers of Suffolk Co., L. I. It was proposed to introduce peanut culture if possible. The first year they promised to be a successful crop, but this year the success has not been so great—judging from the statements of the farmers. It is a question whether they will be more profitable than the usual cabbage and cauliflower. The experiments will be continued

AMONG the old household notions is that of placing a pan of water on the stove in a close room. The moisture is supposed, in some way, to "purify" the air. Does it do any more beyond making the air a little more pleasant to breathe? Would not proper ventilation, by which means a quantity of pure air could be constantly introduced into the room, answer every purpose? There is plenty of pure air on the outside of a building; why not let enough of it in instead of trying to improve it after it has been imprisoned?

PANSIES 2½ inches in diameter at the Rural Grounds growing in the open borders Nov. 15., and this after two hard freezes. There is no other bedding flower that has given us more pleasure during the entire season. The varieties are of the finer kins—bronzes, light blues, blacks, reds, red and yellow, many with distinct margins of other colors. We have never before given careful attention to pansies, though the trouble of doing so is not great. The soil is rich. For the rest we have merely kept them *moist*. During the hottest and dryest weather of the Summer and Fall, these beautiful, bright, speaking flowers, have bloomed continuously and in great profusion.

The Herdsman.

OUR ANIMAL PORTRAITS.

GALLOWAY COW SEMIRAMIS 3D.

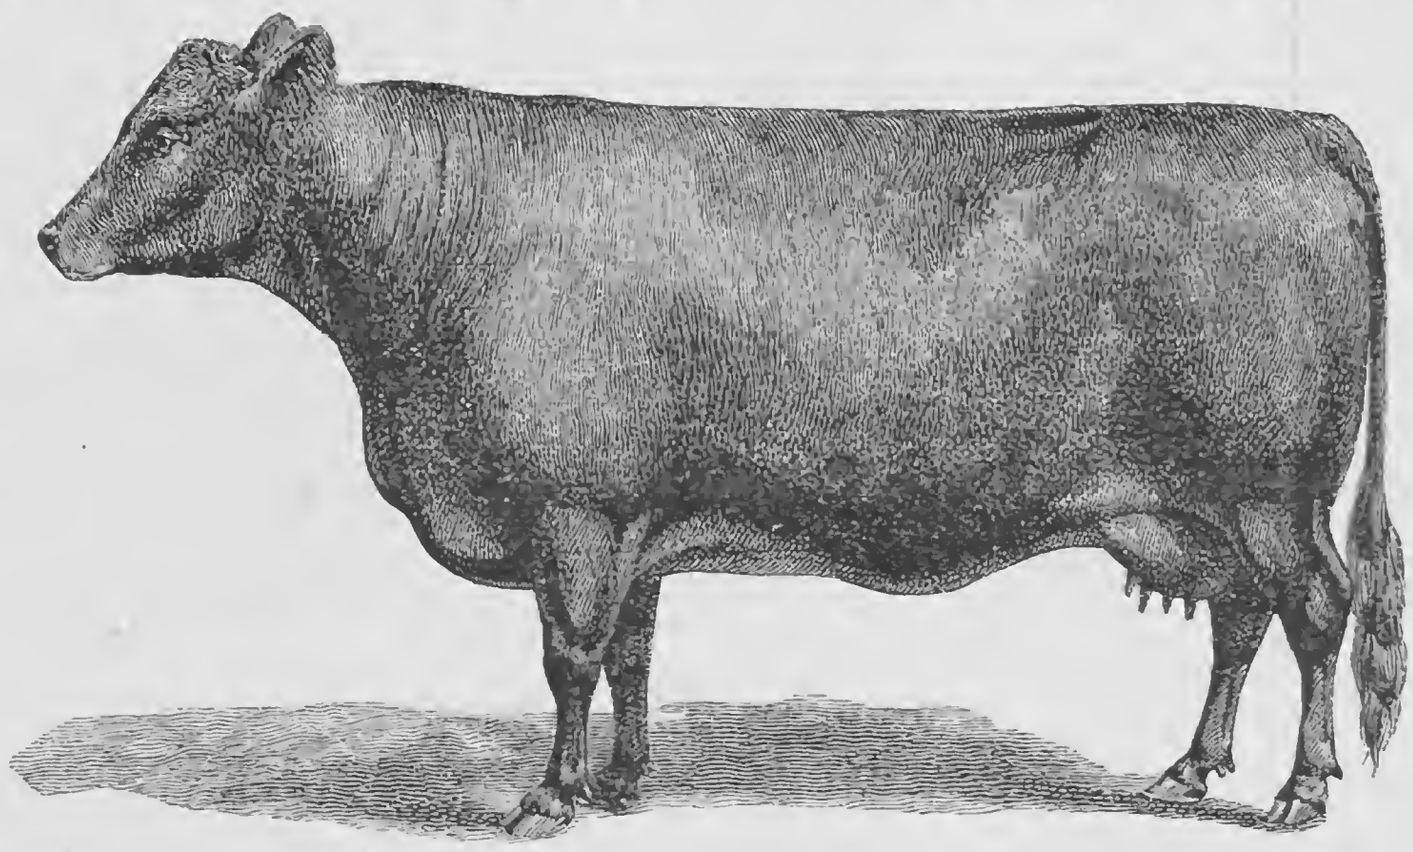
Of late the Galloways have been fully sharing in the "boom" which did so much a few years ago to popularize the other black polled Scotch breed, the Aberdeen-Angus. At the recent fat stock shows they made a very creditable exhibit, although their number was considerably smaller than those of other breeds which have been longer and more extensively introduced and propagated. They are remarkable for their round, compact bodies, short legs, and especially for their thick, heavy, black, shiny, and often curly coats of hair. They are exceptionally hardy and thrive better perhaps than any other pure breed in the northern parts of the country, such as Idaho, Montana, and Dakota. The fine specimen shown at Fig. 441, (re-engraved from the London Live Stock Journal) is the Galloway cow Semiramis 3d, (4,220) the property of the Duke of Buccleuch, Dunlaurig, Dumfries, Scotland, and a prize winner at several shows in England and her native country.

PRINCIPLES OF BREEDING.—No. II.

G. E. MORROW.

Breed; pedigree; selection; variation.

A *breed* may be defined as a collection of animals possessing distinctive characteristics which are uniformly transmitted to the offspring. There must be certain distinctive characteristics distinguishing the animals from others of the same general class. These characteristics must not only be possessed, but they must be transmitted to the offspring with reasonable certainty. Possession by both parents of any property makes its transmission probable; possession of it by not only the parents but by all the ancestors for several generations makes its transmission almost certain. By persistent selection of breeding animals which possess some quality desired by the breeder, rejecting all which do not possess this, it will become so fixed as a characteristic that it may with confidence be expected to reappear in the offspring; and whenever this is true of any collection of animals, they may with propriety be called a distinct breed or variety.



GALLOWAY COW SEMIRAMIS 3. Re-engraved from the London Live Stock Journal. Fig. 441.

Here is seen the value of *pedigree*. It is the best possible guarantee of purity of blood; hence of certainty of transmission of the distinctive qualities of the breed. If the breeder relies on the quality of the parents alone, there is no certainty that some undesirable quality may not appear through reversion. If these parents each have a trustworthy pedigree, showing they have descended for several generations from animals which possessed the same qualities, it becomes a matter of no consequence whether or not there be reversion. The test of value of any pedigree is the merit of the animals which are now entitled to it. Merit in the immediate and near ancestors is of much more importance than equal merit in those ten generations back. Undue importance may be attached to pedigree, but it has great value, and cannot safely be ignored by the breeder.

No breed is so perfect that continued *selection* is not essential to successful breeding. Equally purely-bred animals possess the desired qualities in different degrees. They will not all be alike in size, for instance. Only by continued selection can the size desired be maintained. And so of any other quality. When a change of quality, or size, is desired, selection of animals showing a variation or a tendency to it, will naturally be made.

Variation in many qualities can be secured and fixed not only by selection of animals which, through reversion among other causes, manifest a tendency in the desired direction, but also by changing the conditions under which the animals live—their food, shelter, management. Obviously the size of twin animals, alike at birth, may be greatly affected by food and care, so there shall be marked differences at maturity, the one being above, the other below the usual size. There will be a tendency for these variations to reappear in the offspring. By continuing the variation in treatment and by continued selection, this variation, like any other, may be reasonably fixed as a characteristic of the family, or breed.

When an animal, or a pair of them, show a remarkable variation from the usual type, this variation is not usually reproduced, at least not in a full degree. In some cases extraordinary variations are transmitted, and by selection have become fixed as a characteristic of a breed—as the fifth toe of some breeds of fowls. It is more safe, however, to select, for breeding purposes, animals of only moderate development in any quality, if that quality be usually highly developed in the breed, than to select those of great development in a quality not common to the breed.

Side by side with wise selection of the parents, must go appropriate feeding and management of the progeny. G. E. MORROW.

University of Illinois, Champaign.

KANSAS CITY FAT STOCK SHOW.

(RURAL SPECIAL REPORT.)

Poor attendance; unsatisfactory exhibits of sheep and swine; superb cattle exhibit; a wonderful Aberdeen-Angus champion steer; a fine Hereford bunch; Sussex and Galloways ahead at the block; fast-growing youngsters.

The fourth annual Fat-Stock Show at Kansas City, held from October 23 to 30, inclusive, was favored with as good weather as could be desired, but notwithstanding this, the attendance from both city and country was disgracefully small. For the meager attendance by residents of the city, which should send 5,000 visitors to this show every day it is in progress, it is convenient to account by saying that Riverview Park is from 1½ to 3 miles from the main residence and business portion of the city, and only to be reached through streets not the most pleasant at their very best and now especially disagreeable from an immense amount of work being done for their improvement, in the way of paving and cable railroad-building.

The exhibits of swine and sheep were not satisfactory, and were only a small fraction of what they should have been at a show held, as this is, almost in the heart of the great American pork-producing and wool-growing region. This year about 25 head, mainly of Cotswold blood, constituted the sheep show, and four or five exhibitors with some 30 swine in all, none of them more than mediocre, made up the swine department. Why every one of these shows has not brought out 100 or more exhibitors with at least 1,000 meritorious porkers—the best in the world—has always been a mystery and surprise to the management.

This year, as heretofore, the strong feature of Kansas City's show was in the cattle department. Last year 108 head were here, and this year there were 130—a superb collection, averaging much younger, of wonderfully good quality and showing great improvement in the direction of early maturity. Of breeds the following is the list: Thoroughbred Short-horns, 26; Aberdeen-Angus, eight; Herefords, four; Galloways, two, and Sussex, one. Grade Short-horns, 23; grade Aberdeen-Angus, 18; grade Herefords, 38, and grade Galloways, 11. Of these 49 came from east of the Mississippi—17 from Kentucky, nine from Indiana and 23 from Illinois. The big animal of the show was a grade Hereford from Indiana, weighing 2,545 pounds, and 1,611 days old. He won no prizes. The champion animal (alive) of all was a pure Aberdeen-Angus steer reared at Independence, Mo., named Sandy. His age 939 days and his weight 1,855 pounds, showing a gain per day from birth of 1.97 pound. He won the prize as first in his class, the class sweepstakes, the sweepstakes by age in the two-year-old ring, the grand sweepstakes as the best animal in the show, the first prize for early maturity and the Breeder's Gazette challenge gold medal for the best animal in the show bred and fed by his exhibitor. The same steer was shown here last year as a yearling with the magnificent weight of 1,455 pounds at 581 days of age, and a gain of 2½ pounds per day from birth; he then won the first in his class, the sweepstakes as the best yearling in the show, and the first over all for early maturity. He was bred and is owned by Messrs. Gudgell & Simpson of Independence, Mo.

The winners of the $100 prize for best lot of five steers, one and under two years old, were grade Herefords, averaging 621 days old, and weighing an average of 1,359 pounds. These steers won here and at Chicago last year as the best five steers of any age or breed under one year old, averaging at that time 751 pounds when 271 days old. In the 358 days since they were first weighed at Kansas City, their average gain per head has been 608 pounds. These handsome fellows were bred, fed and shown by Mr. James A. Funkhouser, of Plattsburg, Mo.

Rightly, in a show of this character, no class attracts more attention than that for dressed carcasses, for there it is conceded the most critical and careful judgment can be given. Here, for best carcass of steer, spayed or barren heifer three years old or over, the prize went to a pure Galloway cow, 2,406 days old, weighing, alive, 1,825 pounds, and dressing 66½ per cent. of her live weight. For best two-year-old carcass the prize went to a pure Sussex heifer 805 days old, weighing 1,360 pounds and dressing 67½ per cent. of her live weight. Her gross gain per day from birth had been 1.68 pound. This same carcass also won the $100 sweepstakes for being the best over all exhibited.

The best carcass one and under two years old was that of a grade Galloway steer 694 days old, weighing alive 1,385 pounds, showing a gain per day of practically two pounds, and dressing 64 per cent. of his live weight. The lowest per cent. dressed by any animal was 53, by a hard-looking, aged, Short-horn cow that really had no sort of business in such company. She was the only pure Short-horn slaughtered. A lot of youngsters that attracted much compliment, was made up of five grade Angus calves, ranging in age from 199 to 251 days, and in weight from 620 to 650 pounds. Of these the youngest showed a gain per day of 3.12 pounds; but even he was surpassed by another, two months younger, that had grown 3.24 pounds for every day of his life. Awards were in nearly every instance made by judges from abroad, and probably their decisions came as near giving satisfaction to all concerned as is ever the case at any like exhibition. The show was under the general management of Secretary J. W. Sanborn, who is serving his first year, and the Superintendent was Mr. George Y. Johnson, well known to the public as Secretary of the Kansas State Fair, and Superintendent of the Department of Agriculture at the New Orleans World's Exposition.

THE CHICAGO FAT STOCK SHOW.

(RURAL SPECIAL REPORT.)

The American Fat Stock, Horse and Dairy Show has begun and may be safely written down as, taken in all, the most interesting yet held. The number of cattle is smaller than of recent years, because of the fear of disease, but my first impressions are that the average quality is very good—with some animals nearly or quite equal to any ever shown here. There are no remarkably large animals; a fact not to be much regretted. Short-horns, Herefords, and Aberdeen-Angus are very well represented with a few Holsteins, Devons, a single Ayrshire, etc. They come from several States, Canada and Europe. The swine and sheep departments are at least creditable in quantity and quality. The horse show is very large and good, and proves a great additional attraction. Dairymen have made, as it seems to me, a serious mistake in sending forward only a comparatively small exhibit of butter and cheese, apparently very satisfactory in quality. There is an exceedingly attractively shown exhibit of butterine, and the fats of which it is made—shown in a separate room and without prizes or classification.

There is a very large and good poultry show, and let us give honor to the agricultural press—undoubtedly the most extensive show of corn ever made in this country, in competition for prizes offered by the Prairie Farmer.

I have attended all these shows, and have seen none in which there was quite so much to interest and instruct. There is good promise of attendance at the various meetings of stock associations.

The State Live Stock Commission has decided to have the cattle exposed to pleuro-pneumonia appraised, then slaughtered; the owners to receive certificates, to be paid when the Legislature makes appropriation. Most of the owners consent willingly to this plan. The healthful meat will be sold.

Chicago, Nov. 10. G. E. MORROW.

Law.

LIABILITY FOR LOSSES OF SHEEP BY DOGS.

Not only is the owner of a dog liable for its acts, but any one who harbors it or allows it upon his premises, is also liable. But a person is not responsible for the acts of a dog which he tries to drive away from his premises, or for those of a dog allowed to remain temporarily there, as in the case of one who keeps boarders and permits them to keep a dog on the premises; but in that case the owner of the dog is liable. The laws with regard to liability for injury done by dogs to sheep vary considerable in the different States. In Vermont, New York, Pennsylvania, Delaware, Ohio, California, Tennessee, Alabama, Minnesota, Oregon, Illinois, New Jersey and Mississippi the statutes expressly provide that any person may kill a dog found worrying or injuring sheep. In Michigan any person may, without rendering himself liable to civil or criminal action, kill a dog he may see chasing, worrying, wounding or killing sheep, swine, cattle or any other domestic animal. In Maryland the owner of a dog is exempted from liability for sheep killed, if he kills the dog immediately on receiving notice of the injury; but if he fails to do so, the owner of the sheep may kill the dog and recover double damages. In New Hampshire and Massachusetts the owner of any domestic animal, and in Wisconsin the owner of any sheep or lambs, may recover from the town for any injury inflicted by a dog. If he choses the owner of the injured animal may sue the owner of the dog, instead of claiming damage from the town; but if he prefers to prove his loss to the town supervisors, and accepts an order on the town treasurer for the amount, the claim is transferred to the town which may recover against the owner of the dog; but the owner of the sheep cannot thereafter recover against him. In Rhode Island, the first time a dog worries a sheep the owner can recover damages from the person who harbors or owns the dog. If after the first notice the dog is still allowed to live and injures sheep again, his owner is liable for double damages, and the Court may order the animal killed. In Alabama, California, Vermont and Wisconsin double damages can also be recovered. In Connecticut whoever has lost by dogs worrying or killing his sheep must give notice to the town selectmen, and these may sue the owner or harborer of the offending dog, and unless the sheep owner is reimbursed by the suit, the town becomes liable for the damages. To provide a fund to meet this liability, dogs are licensed, and the license fees are held to meet such claims.

When several dogs belonging to different owners unite in committing mischief, at common law each owner is liable only for the acts of his own animal. There would naturally be considerable difficulty in ascertaining the extent of the injury done by each dog, but the jury can adopt any reasonable rule for ascertaining the damages. If the animals are of unequal size and have different capacities for mischief, the jury may take into con-

sideration the damage done by each in approximating the liabilities of the owners. By statute, however, in Connecticut, Vermont, and Ohio, the several owners of dogs that unite in mischief are jointly liable therefor; while in Pennsylvania each owner is liable for the whole injury in the doing of which his dog was jointly engaged.

R. M., Rome, N. Y.—I hold a note duly signed, now over six years old, interest on which has been paid to within three years; is it outlawed, or does payment of interest keep it within the limit of the statute of limitations?

ANS.—An indorsement of interest or principal, made by authority of the debtor, takes the note out of the statute of limitations. Parsons on Contracts vol. 3, page 79; Lowery v. Gear, 32 Illinois, 382. "Payment of interest stops the running of the statute against the security, as well as against the principal." Lawrence Co. v. Dunkle, 35 Mo., 395; Whitaker v. Rice, 9 Minn, 13. The period named in the statute will begin to run from the last authorized indorsement of interest.

C. G, Montclair, N. J.—1. Can a patent be obtained here for an article made in Scotland for many years, but which has never been patented here? 2. Can a man make a patented article solely for his own use without laying himself liable to a suit for infringement?

ANS.—1. No patent can be obtained here for any article that has been in public use here or elsewhere for two years before the application for a patent. 2. It is just as much an infringement of a patent to make the protected article for one's own use as for sale.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

A SONG FOR THE GIRL I LOVE.

I.

A song for the girl I love—
God love her!
A song for the eyes that tender shine
And the fragrant mouth that melts on mine,
The shimmering tresses uncontrolled
That clasp her neck with tendrils of gold;
And the blossom mouth and the dainty chin—
The girl I love,
God love her!

II.

A song for the girl I loved—
God loved her!
A song for the eyes of faded light,
And the cheek whose red rose waned to white,
And the quiet brow with its shadow and gleam,
And the dark lashes drooped in a long, deep dream,
And the small hands crossed for the churchyard rest,
And the lilies dead in her sweet dead breast.
The girl I loved—
God loved her!

—*Credit Lost.*

OF INTEREST TO WOMEN.

A FARMER'S wife writes as follows to the New York Witness: "I was reading some time ago that a large portion of the women that go insane are farmers' wives, and when I look her life over I almost wonder that they do not all go insane." She rises in the morning and cooks breakfast for the family (I am writing of the average farmer's wife), then the work is to be done up, milk to skim, butter to work, two or three little ones to get ready for school, a nice lunch to put up for their mid-day meal, while baby is all the time crying to be dressed for breakfast. She must wash and dress him, and put him to sleep for his morning nap, all the time watching the clock to see how fast the hands travel toward twelve. Now, while he sleeps, the beds are to make, bedrooms to sweep, and a thousand other things to do too numerous to mention. Before this is done it is time to start dinner, for she knows the clock-hands are no more sure to point to twelve than the men are to be there for dinner and she knows too well how many glances of dissatisfaction will be cast at the unset table, even if the tongue is silent. She catches the now wide-awake baby in her arms and carries him around for awhile, then sets him upon the floor, hunts some playthings, and every time she passes speaks to him to keep him quiet. Dinner over, here are dishes to wash again, baking to do, perhaps the kitchen to scrub (I am only glancing at the common every-day work, leaving out extra work, such as washing, ironing, house-cleaning, sewing, etc., etc.), then supper to get, and the dishes to wash by lamp-light, while the men are resting and reading the papers; then sit down to knit or patch (after baby is disposed of): then when she is tired and feeling blue, by way of amusement she can hear the men talk of how much easier times women have than they do. In the Summer she is in the shade (of course the hot stove don't count), then in the Winter she can sit by the fire, while they are out in the cold. They forget the cold dishes she must handle bare-handed, and the cold rooms she must attend to. But I think that the part that really drives them insane is yet to come. They spend day after day, even into the weeks often, without seeing one of their own sex. How many days do men pass without meeting other men, if only for a few moments, and comparing views? Do you ever stop to think of how much better you feel after that little chat while the team is resting? Then, do you ever think of your wife all alone, day after day, longing for a few moments' talk with some woman? Is it any wonder that as time passes she gets tired of home, sick of the sight of everything around it; and, if to this is added heart-hunger, what wonder that she longs to lay the burden down and take an eternal rest? How many times when you have the team hitched up, and have an errand to neighbor A's, you might ask her to go along! Even if for only five or ten minutes, it would, at least, show her that you are thoughtful for her comfort (which she is sometimes led to doubt). I, for one think it no wonder that so many become insane.

EMELINE.

FRESH FIELDS FOR WOMEN.

ALL writers on women's work are alike in protesting against woman's conservatism in labor; her tendency to move only in beaten tracks, and they of the narrowest. It seems to us that the best advice to every feminine worker is to turn her energies to whatever she feels her special work, whether it be old or new. To advise all women to adopt a profession, whether suitable or not, is a most mistaken idea. Many country girls who feel the necessity of working for themselves, are troubled with a sore uncertainty as to what field they shall enter. They prefer leaving domestic service to the horde of untrained foreigners who come down like the Assyrians of old, and flock to the manufacturing towns and cities, to wear out health and freshness in underpaid labor. In our grandmother's time farmers' daughters saw no disgrace in doing light field work, but this is a thing rarely seen now-a-days. The "Nebraska Horticulturist" speaks with much contempt about the superficial twaddle one hears about the degrading effect of out-door work upon women. They must be peculiar women who are more degraded by working in God's pure air, amid the beautiful sights and sounds of nature, among the wonderful plants of garden and field, than by being cooped up in a hot kitchen handling pots and kettles, doing chamber work and mending old clothes. No honest work is degrading to any woman, unless it injures the moral nature or weaken the body.

As a pair of model women, who, when they want any rights, just get up and take them, we may mention two Kansas sisters, who are proprietors of a large florist's establishment. They have large greenhouses and store, the result of their own unaided exertions, and in business tact and enterprise they are not to be excelled by any of their brother professionals. Of course they employ help, but they manage their work independently and are quite able to show their employés what to do and how to do it. One of the firm is State Vice-president of the Society of American Florists, and a valued member of that body. What these courageous women have done others can do, and there is no doubt that many branches of horticulture and agriculture offer a healthful and remunerative field for feminine labor.

WOMAN'S CHIEF END.

SELMA CLARE.

IT is said that woman's chief end is to marry; as, however, after marriage a woman's life with all its possibilities of happiness or utter misery is really only just beginning, it is necessary to have some end in view. With the true wife this will be to keep her husband's best gift—his heart A wise woman does not desire to rule the man to whom she links her destiny; she wishes to be guided by him and sees no bugbear in the word "obey" of the marriage service. But it is not necessary to be wise after the philosophy of "Ouida," to know that a woman cannot keep her husband's love merely by loving him. "Man," says a writer who shows considerable knowledge of the subject, "is of all animals the most susceptible to creature comforts." A loving heart is all very well as far as it goes, but if it neglects to season the soup, and shows an utter forgetfulness where sock heels and shirt buttons are concerned, it loses some of its enchantment.

A woman must possess not one but all the virtues. She must never make the mistake of supposing that her husband is indifferent to the neatness of her hair, or the daintiness of her gown. She must be bright and entertaining, though every limb aches, and she be almost ready to sink in sheer despair from the thousand and one annoyances of her daily life. Above all, she must know how to hold her tongue. She may be bursting with righteous indignation, but must give no sign.

A cynic who peeps over my shoulder asks if it is worth while to go through so much to gain so little. That question, dear reader, can only be answered by each one of you individually.

FOR AND ABOUT WOMEN.

ALICE.

I ONCE heard a great philosopher asked what quality he esteemed most highly in a woman. He replied: "A sweet and happy spirit, what the French call *gaieté de coeur*." Not learning, not beauty, but simply a sunny disposition that enables her to find pleasure in all things, great and small. This it is within the power of every woman to possess. Every one knows how utterly disagreeable a "contentious woman" can make herself, and everyone is familiar with the type of woman who is never pleased, be the skies sunny or cloudy No beauty of face or form can atone for such a disposition, and it is a peculiar circumstance that the mildest and most inoffensive men usually immolate themselves on the shrine of such women. A woman who can smile when the bread comes out of the oven underdone, or burned, when the kitchen fire smokes, when the clothes will not dry, and when the children are unusually cross, does not add to her own burdens and lightens those of everyone else. If you are inclined to a peevish, and fault-finding disposition, and would see how unlovely you make yourself to those around you, read "Our Mutual Friend," and my word for it, you will lay down the book resolving not to be a Mrs. Wilfer.

There is as much difference between nagging and scolding, as between a heavy Scotch mist and a downright rainpour, and to my mind the former is by far the most disagreeable of the two. Still as regards both the nagging and scolding, we say "don't." No greater misfortune can befall a child than to be grown up under the influence of everlasting complaining and fault-finding. It has the effect of making him callous-hearted and unamiable, and often malicious as well. When one is always getting the blame of doing wrong, one begins to think as the children say that one might as well have "the game as the name." A child loses all ambition to gain a favorable opinion when he finds that he only strives in vain. A scold is a wicked destroyer of the morals and happiness of children, and we sometimes regret that the good old-time way of treating such has gone out of fashion.

Custom has a powerful hold over women. What the world will say, the restraints of her family or social station, keeps back many a woman from making a career for herself. It is only in such isolated cases that we hear of a woman running a saw mill in Florida, of another who owns a stock ranch in Colorado, and still another who navigates a steamboat in Louisiana, that these few cases seem anomalies. In two of these instances drunken husbands, and in the other the death of her husband set these three plucky women afloat. Many women have thrift, tact and judgment, and are quite as capable of taking charge of a business as men. Where women have entered offices as clerks, I am invariably told by business men that they make better clerks than young men at the same salaries would do. If a woman has a strong leaning toward some vocation, be it service, trade or profession, and she has no maternal duties to restrain her, let her follow that leaning, regardless of what the world will say. Fanny B. Merrill, in the New York Graphic, says, "I love women so well that I would rather see them anywhere than out in the world fighting for themselves. I would rather see a daughter of mine wearing linsey-woolsey gowns and eating hoe cake in a log cabin, with a man for a husband who was seven-eights perfect (as men grow), than to see her the most brilliant, clever, gay, powerful woman of American looking out for herself."

This is all very well, and is quite the sentiment of any right minded woman, but unfortunately there is a great deal beside sentiment in this world. Few men are seven-eights perfect, and barring all this, the fact that there are more women than men, precludes the possibility of every women having a husband. I know more than one woman who is to-day fighting for herself on account of an unfortunate ticket drawn in the lottery of marriage, who will tell you if she is honest, that she has met with more courteous treatment from what Fanny Merrill calls a "jeering, disrespectful public," than she ever met with from her husband.

GOLDEN GRAINS.

THE books that delight the mind and sweep the cords of the heart as with a magic hand are those that have been written by men and women whose pens have been urged on to genial tasks by gifted intellects and sympathetic, loving hearts.....

IF a man be gracious to strangers, it shows he is a citizen of the world, and that his heart is no island cut off from other lands, but a continent that joins them.....

EMPLOY thy time well, if thou meanest to gain leisure; and since thou art not sure of a minute, throw not away an hour. Leisure is time for doing something useful; this leisure the diligent man will obtain, but the lazy man never; for a life of leisure and a life of laziness are two things,... ....

FOR the best results there needs be the longest waiting. The true harvest is the longest in being reached. The failures come first, the successes last. The unsatisfactory is generally the soonest seen..... .....

WHAT an argument in favor of social connection is the observation that by communicating our grief we have less, and by communicating our pleasure we have more.. ....

HE that has something to do has less temptation to doubt the man who has nothing to do but to doubt. Heresies in the Christian Church come never from the city missionary, never from the faithful pastor, never from intense evangelists; but always from the gentlemen at ease, who take no actual part in the holy war..... ....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

What can be more hopelessly, helplessly sad than an uncongenial husband and wife?

PITHS.

WORSE fates are in store for girls than becoming "old maids."

IT is not your duty to keep your children busy every minute they are out of school.

WHEN a child returns from a neighbor's house, don't question him as to what each member is doing, or as to what was said, unless you wish to sow seeds of gossip and mischief.

THERE are coming days when the small chicks can't play out. Let them have their fun in the house even at the expense of your tidy kitchen. We have in mind a child made fretful through keeping in the house, who was transformed into a sunny little fellow by means of a pile of white sand with patty-pans, colander, cup, spoon, etc. in one corner of the kitchen.

PROVIDE your children with rubbers and see that they are worn when they go out. They are just as necessary when the ground is cold and damp as after a rain. What protection are the paper soled shoes that we often see little tots wearing at this season of the year? Is it to be wondered at that they have colds and croup?

DON'T give Christmas presents because you feel that you *must* do it. Give for the love of it or not at all.

KITCHEN TALKS.

ANNIE L. JACK.

THE pleasant, sunny days that come now and then are fully appreciated in November as gala days are to those who are past their youth. And so the years pass on alternating sunshine and shade, and we are once more looking forward to a new year, that is heralded by the beautiful Christmas-tide. I was thinking all this in the kitchen this afternoon when one of the children came in—"Only four weeks to Christmas!" she exclaimed with a satisfied sigh, and I thought how happy a childhood was, that was not sated before its time, and could enjoy at any time the simple home festivities, and live content in the anticipation. Truly Longfellow wrote: "Of the past the old man's thoughts were and the maiden's of the future."

Yet how many of us must realize the beauty of the poet Whittier's verses,

"Not mindless of the growing years
Of care and loss and pain,
My eyes are wet with thankful tears
For blessings that remain.

If dim the gold of life has grown
I will not count it dross,
Nor turn from treasures still my own
To sigh for lack and loss."

And speaking of "loss," there is no sorrow for riches that have taken wings and departed, that is equal to the grief felt for the loss of affection. A mother said to me lately, "I did not believe it when 'grandma' told me that I was seeing my best days while the children were small, but I know now she was right. When my little girls were about 12 and 14 years of age I was everything to them, and they had no secrets from me, but now that Lulu is married and Mattie is engaged, I find there are many things changed. Some one else gets the first, best thoughts of their hearts, and though they do not love me the less I am not all in all to them. I do not say it is not best so, they will have some one when I am gone, but it is rather a hard experience. And though in earlier years we might have been more to each other, yet it is now that they are of an age to be more like companions to me, and to understand me as children cannot do."

Yes, so it is we are never contented; there is

always that craving for something else, let us hope it is for "something better." And one of *my* subjects of discontent was the flies that will not leave the kitchen. They came in when the wire doors were taken off these later sunshiny days, and have taken up their abode with us—quite strange guests in our kitchen. The Amateur Cook one day determined to be rid of them, so put rolled brimstone on the stove and set fire to it, the fumes penetrating through the house. But when the kitchen doors were opened the flies were as lively as ever, they had breathed through it all. It is generally supposed that this nuisance is due to uncleanliness, but whether of your own household or your neighbors it is sometimes hard to judge. And I know some farm homes where the women are thoroughly clean and neat about the door-yards, but the barn-yard is kept reeking with filth all Summer, and they are unable to remedy the evil.

Besides the annoyance, it is certain that such people are responsible for the ill health, not only of their own families, but for the spread of any disease that will feed upon these filth germs wherever found.

SKATING TOQUE.

A CHARMING skating or evening toque is made from zephyr wool. Make a chain of 44 stitches, and then crochet across with the single crochet stitch, that is, by winding the wool once around the needle, until you have a piece the length of which will go around your head. Double it and sew it half way up; gather all the rest of the aperture and draw it to a point in front. Roll up about two inches of the lower part or that which goes around the head, and finish with two enormous pompons to hide the seam which must come in front. These are made by winding the worsted very full around a small book or box, and tying it securely in the middle, after which cut the ends.

A black one with a black and white pompon is very effective. For a child, cardinal, scarlet or blue, or white with scarlet or blue pompon is pretty. MOTHER.

A MEDICINE SPOON.

THIS is made by bending an ordinary spoon so that it will stand level. It has been found

Fig. 442.

of great convenience in dropping out medicine with a child in arms. A. C. CARPENTER.

GLOVE CASE.

TAKE a piece of silver-colored leather canvas 21 inches long and six and-one-half broad; slope off one end to form a point, leaving the sides to measure 16 inches. Work a border in cross and loose stitches in Berlin wool of any shade you may prefer. Line with cashmere in some delicate shade to match or contrast with the embroidery, and fasten around the edge with wide buttonhole stitch in white silk. One-and-three-quarters inches from the edge on each side place straps of white llama three-quarters of an inch broad, which button over each other to form six divisions for placing gloves. At the pointed end have a ribbon a yard long fastened in the middle for tying the case when rolled up. EMMA.

WEANING THE BABY.

A MOTHER who has not a plentiful supply of milk, should begin very early to accustom her child to a little simple food, and if possible give it from a spoon, as weaning from a bottle is often as troublesome as weaning from the breast. A child can be taught to eat from a spoon when a month old. It is a great mistake in weaning a baby to begin by giving it little bits of everything. I have seen mothers dip a crust of bread in bacon fat, or gravy, or even give small pieces of bacon or beef to very small babies. Even if this is not injurious to their health in the small quantities in which they get it, it is injurious in one way as it gives them a taste for such things, and by making them reject with scorn the simple diet which should form their staple food, trebles the trouble of weaning them. NURSE.

THE KITCHEN SINK.

THE possibilities of a kitchen sink that is not kept rigidly clean, for producing typhoid fever are great. A sink should be of iron, or, better still, porcelain-lined. Nothing of a very greasy nature should be allowed to flow into it, such as the water in which ham or pork has been boiled. If you wash your dishes properly, the dish water will not be so greasy as to be harmful. At any rate the sink should be scalded every day with plenty of boiling water, and at least once a week throw down a solution of washing soda with a gill of crude carbolic in it, and, my word for it, the health of the family will improve. A good housekeeper will see to it that the closet under the sink is as neat as any other part of the house, instead of being what it often is, a receptacle for all the dirty dish-cloths and greasy rags that have been accumulating for ages.

PALMETTO.

ONE WINTER.—No. III.

ANNE THRIFTY.

THANKSGIVING morning was clear and cold with a powder of snow covering the ground. The boys were in great glee and wanted very much to help me, especially about the work they could not do. Bertie was sure he could baste the roasting ham, and Sammie wanted to roll the dough for the dumplings, until between the teasing of the twins and my anxiety lest the dinner should be a failure, I seemed likely to drive out the thankful spirit of the day by an outburst of sharp scolding. Feeling my temper was getting the better of me, I caught both boys at once by an arm and hurried them into the sitting-room. The action was so sudden and unexpected that a funny mixture of fright and surprise showed itself in their faces, and I found myself laughing before I had begun to scold; that reassured them and Bertie started up to run into the kitchen again, but I detained him and then told both boys, kindly and seriously, how much they had troubled and worried me, ending my talk by asking them if they would now do something to please me. Both were ready to promise, so I asked them to get their slates and make the prettiest figures with straight lines that they could think of, to show to our visitors. The idea pleased them at once, for drawing was their favorite study at school, and thinking out new designs in straight lines part of their lessons. For an hour they were as busy as little beavers, each keeping his slate from the other, and both trying to make the "prettiest figure in the world for Cousin Anne." Uncle John was doing a half day of extra work at the engine works, where he was employed, for the extra pay, though little enough, was something to us, so I was quite alone with the work of getting up my first company dinner. I watched everything with the greatest anxiety, for not only was my reputation as a cook at stake, but should anything be spoiled in cooking I had nothing to replace it with. But everything went well, and Uncle John and our friends came in together, just as everything was ready for a hot dinner. Young Mr. and Mrs. Turner and the old lady were generous-hearted, friendly people, and made themselves at home at once. Mr. Turner praised the drawings the twins showed him, until they blushed with pleasure and confusion, and his wife and mother complimented my dinner in such a hearty way, and said such kind things of Aunt Helen and of her many neighborly favors to them, that in my pleasure I forgot to be embarrassed or to be worried about the serving of the dinner. Mrs. Turner was an energetic worker, and told us a good story at her own expense of going to bed one cold Sunday night determined to waken at four in the morning to begin her washing. After a sound sleep she wakened with a start, very much annoyed that she had overslept. Dressing with haste, the fire was soon burning under the wash-boiler, and after a hasty bite of breakfast, she was busy rubbing the clothes, when a knock at the door called her from the tub to answer the anxious questions of a friendly neighbor, "Is anything the matter? Are any of your folks sick?" and to learn by looking at the clock that her washing was well under way at half past one in the morning. Other stories followed this, and as the dessert of dumplings disappeared, a laughing party rose from the table. Mrs. Turner insisted upon helping me wash the dishes, although I had meant to leave them until our company was gone, as I knew Uncle John would put on a big apron and help me with them, and keep the boys busy too. When we had finished the kitchen work, and were ready to go to the sitting-room, Uncle John came out to ask for the dish-pan and some soap.

Somewhat puzzled I saw him take them, fill the pan full of water and put it on the table and make a fine suds; then he began to search in his pockets and to draw out odd shaped bundles, one for each of us; opening them we found in each a clay pipe. Bertie was the first to shout "soap bubbles, soap bubbles," but we were soon all as busy as he, in blowing "monsters," or rather in trying to blow them, for most of them met with untimely destruction.

The afternoon was gone before we realized that it was going. Our friends carried home the pipes they had used as mementoes. Young Mrs. Turner said hers would remind her of the afternoon when she laughed enough to add 100 pounds to her weight, if there is any truth in the saying: "Laugh and grow fat."

We needed only a light supper and as we ate it the boys talked so constantly of the fun they had on Cousin Anne's Thanksgiving, as they persisted in calling the day, that none of us heard a knock at the door, and were surprised to see it flung open and the boys' uncle Rob, with a great coffee sack over his shoulder and a jug in one hand, standing in the doorway.

A DAINTY APRON.

WE recently saw at "Macy's" a "love of an apron" made of cream-colored scrim, Torchon lace and blue satin ribbon. The scrim part was 24 inches in length and 27 in width with a three quarter-inch hem all round, the lace two and a half inches wide, extending down the sides and across the bottom. It was sewed on without fullness, except at the corners. The fullness at the band was put into four plaits, two on either side, all turning toward the center. These plaits were an inch in width and the distance between the two, on either side, was two and-a-half inches. Longitudinal threads were cut half way down the length and drawn out from the top. There were four places of this drawn work—two on each side—one between the plaits and the other the same distance from the plait on the outside. These places were wide enough to weave inch ribbon in and out, the lower ends of which were covered with jaunty little bows, while the others were concealed by the band. The fastening was at the right side, and finished with a bow of long loops of ribbon.

CHRISTMAS SUGGESTIONS.

IN answer to your request for a description of home-made gifts, I can only describe some made and received by members of my family last year. One gift that was very acceptable consisted of a dozen medium-sized, fringed, plain, linen fruit napkins. In one corner of each was a simple outline design worked in colored cotton, of fruit or leaves—each different.

A black walnut paper-cutter carved with a jackknife, smoothed with sandpaper, and oiled carefully; made a useful present. A loop and bow of gay ribbon attached to the handle served both to ornament it, and to hang it up by. (It is strong enough and smooth enough to cut the heavy double leaves of Harper's Magazine).

A much appreciated gift was a tiny book, three by five inches made of card-board leaves tied together with ribbons. On each page were pasted bits of garments worn by members of the family; of the grandmother who left us years ago; of the "sister who died;" of the father's brocaded vests worn in his youth, and the "changeable" silks of the mother's girlhood; bits of frocks worn by the two girl-babies born to the house; graduating dresses, wedding dresses, etc. The covers were of perforated card-board, with "Keepsake" worked on one, and a fancy figure on the other, in shaded embroidery silk.

Another book was in palette-shape, also of card-board leaves tied together with gay ribbon through the thumb holes. It had but five leaves, one for each national holiday. Each leaf had written on it appropriate quotations in prose and rhyme for the day to which it was dedicated. The Christmas leaf was first and had this: "Behold! I bring you good tidings of great joy, which shall be to all people. For unto you is born this day in the city of David a Saviour who is Christ the Lord."

"The Belfries of all christendom
Now roll along
The unbroken song
Of Peace on Earth, Good-will to Men."

Candy bags made of coarse lace, four by six inches, tied with gay worsted cord and balls, and filled with home-made confectionary, were not despised I can assure you.

[Will our correspondent please favor us with her recipes for home-made candy.—EDS.]

In a friend's house, I recently saw a novel "key-board" that seemed to me in better taste with cottage furniture than the elaborate plush-covered ones so much used. It was a small-sized school slate with two or three children at play painted on it; the frame spattered with "artist drops" as we see on palettes, and quite thickly set with brass hooks on three sides. It was suspended by a brass chain. A clever sketch in black and white, and the frame painted or stained might be equally effective.

If one has a little money to spend on Christmas gifts, nothing can be better than good books, but do not, I pray you, buy *trash*.

I trust that no one will neglect to decorate his or her room with at least a little evergreen in honor of Christmas, and see to it that every child in the family and every poor person in the neighborhood have some gift, however trifling, to help to make them glad on this great Birthday. MISS. E. BECKER.

Doctors Prescribe

Ayer's Cherry Pectoral, for three reasons:—it is perfectly safe for old or young,—can be relied upon in cases of emergency,—and possesses great curative powers.

I consider Ayer's Cherry Pectoral a medical success and a chemical triumph. I have found this medicine a powerful specific for Colds, Coughs, and Pulmonary Complaints. I use it in my own family and recommend it in my practice.—Parker Cleveland, M. D., Prof. of Chemistry and Materia Medica, Bowdoin College, Brunswick, Me.

Ayer's Cherry Pectoral is an invaluable remedy for Colds, Coughs, and all Pulmonary diseases. I use it myself and prescribe it in my practice.—A. S. Pettenger, M. D., Glen Gardner, N. J.

Ayer's Cherry Pectoral,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

GOLD $100.

We will pay one hundred dollars gold in premiums for best results from eight weeks' trial of **Sheridan's Powder to Make Hens Lay.** Send your name and post-office for particulars. I. S. JOHNSON & CO., 22 CUSTOM HOUSE STREET, BOSTON, MASS

News of the Week.

HOME NEWS.

SATURDAY, Nov. 20, 1886.

CHESTER ALAN ARTHUR, twenty-first President of the United States, died at five o'clock Thursday morning at his home in this city in his 56th year. He was unconscious for several hours before his death. The immediate cause of death was the rupture of a blood vessel in the brain—apoplexy. His only son and daughter, his sisters, and a nephew were at his bedside during his last moments. He had been ill from his third year in the White House, from two distinct diseases—fatty degeneration of the arteries and Bright's disease of the kidneys. For some time his digestive powers were nearly destroyed, and for months past he lived entirely on milk. His heart was seriously affected, the organ being enlarged and the aorta (the great artery from which all the other arteries branch off) was diseased. Funeral at nine o'clock Monday morning; body to be buried in the Rural Cemetery, Albany, N. Y., where his father, mother, wife and infant son are now buried. Son of Rev. Dr. William Arthur, a Baptist minister who came from Ireland when 18 years old. Born October 5, 1830 at Fairfield, Vt. Attended Union College, and taught school two Winters to help pay expenses. Graduated in 1848. Taught village school for next two years. In 1850 came to New York with $500 savings and studied law. Later history already public property.....The New York Anti-Saloon Republicans are to hold a convention at Cortland on Nov. 30 and Dec. 1 to perfect State organization and plan future work.....The sloop Mayflower is offered for sale at cost, the offer to remain open until December 1..... The total amount of standard silver dollars in circulation November 1 was $61,353,240 out of a total coinage of $244,767,386. The balance lies idle in the Treasury, which can't get it into circulation.....An Iowa barber has been found guilty for refusing to shave a man of his own color, the U. S. Circuit Court having decided that the civil-rights law is Constitutional, and that a barber-shop is a public place under the law.....The U. S. Supreme Court has just decided a suit brought to settle all existing claims of the Choctaw Nation against the United States. The Choctaws get over $2,500,000, and Col. Lamont, Lincoln's friend and biographer, gets a fee of $250,000 for winning the case after years of litigation. Lieut-Gen. Sheridan has submitted to the Secretary of War his annual report, showing the operations of the military forces during the past year. The army of the United States at the date of the last returns consisted of 2,102 officers and 23,946 men, distributed as follows. General officers, 10; general staff, 375 officers, 1,212 men; 10 regiments of cavalry, 411 officers, 6,042 men; five regiments of artillery, 272 officers, 2,473 men; 25 regiments of infantry, 836 officers, 10,721 men; Indian scouts, 595 men; detachments, recruiting parties, etc., 2,003 men..... It is said that the Dominion Government is sick of its fishery policy and will soon put the cruisers in winter-quarters and drop the prosecutions..... There are threats of a strike on a large scale by the operatives of the cotton mills of Fall River. They have long been dissatisfied with the scale of wages paid, but every effort to obtain an advance has failed. The mills are making large profits, while the operators are paid starvation wages..... The receipts at the late fisticuff when Sullivan "knocked out" Ryan at San Francisco in the third round, amounted to $11,000. The expenses were $2,000, and of the $9,000 Sullivan got 75 per cent., or $7,750, and Ryan 25 per cent., or $2,250—the fight lasted about eight minutes.....The public school system of Georgia is an impoverished institution. It contracts with its teachers for a term of 65 days at five cents per day per capita and settles with them at about 65 cents on the dollar.....Tuesday a fire destroyed a large part of the business portion of Durham, N. C.; loss, $3,000,000, including 1,500,000 pounds of loose tobacco. The Tobacco Plant newspaper office was destroyed. Insurance about $200,000. .....Delegates representing 17 fraternal societies, with a membership of 530,000, met at the Riggs House, in Washington, and organized a National Congress of Fraternal Beneficiary Societies.....One of the latest ways in which Wall Street men have found the opportunity to invest funds as a speculation is a scheme that has several thousand dollars back of it to preserve Autumn leaves by a new process, the invention of a Yankee college professor. The leaves—so promise the bulls in the enterprise—will retain all their fresh and bright hues for years, and remain fast to the limb just as nature produced them. .....Mr. Ward, a Clyde shipbuilder, is crazy enough to assert that Secretary Whitney has—in a public advertisement—attempted to bribe English ship designers by offering a high price for the best plans for our new war vessels. It is charged that this was a bribe to men in the service of European Governments to betray the plans for European war ships. Englishmen, themselves, build war ships for all foreign governments able to pay for them, and, of course, Whitney was perfectly justified to seek suggestions for our new ships from every quarter.....Pay Director Fulton has been appointed Paymaster-General of the Navy. Born in Tenn. in 1835; a State legislator in 1857-58; purser in the Navy in Nov. 1877; always served with distinction in the Navy since then.....There are reports of plots and counterplots for the annexation of the 40,000 square miles of Honduras to this country. Soil rich with vast amounts of gold under it, but an obstreperous, refractory people on it... ....Austria is willing to settle that diplomatic squabble, and Charles Jonas, of Wisconsin, has been appointed Consul at Sprague. Formerly Austria refused to receive him, as he was an ex-Austrian subject and conspirator, and a bitter enemy of the Emperor. Austria will soon appoint a Minister at Washington; and we'll send one to Viennia, vice Kieley rejected.....Ingersoll has "no time" to plead for the Chicago Anarchists.....Mr. Benton, United States District Attorney for the Western District of Missouri, has been reinstated in the office from which he was suspended for what was deemed undue political activity. All the Democratic Missourians were earnest in his favor.....A Chinese has bought for $16,000 the exclusive right of selling opium in Panama, and the money will be devoted partly to the hospitals and partly to reducing the public debt,.... ....A fierce, blinding blizzard and snow storm prevailed in the Northwest Tuesday night and Wednesday; the worst in 10 years in Dakota. Snow began falling at St. Paul early Tuesday morning and continued all day. After midnight a blizzard set in, and Wednesday morning the streets and sidewalks were badly blockaded, so that travel was next to impossible. The blizzard began in the western part of the State and swept east and south through Wisconsin. Railroad travel is greatly impeded and street cars find it almost impossible to run. The wind was blowing hard Wednesday and drifting the snow as fast as it fell. No such storm had occurred there so early in the season for years. The thermometer at Denver, Col., stood at four below zero Wednesday, and in different parts of the State dropped to 20 below. The Colorado railroads are open, but in West Kansas and Nebraska, where the snowfall was much heavier, blockades are reported. The gale and snow storm swept over the great lakes with terrible violence, and the loss to shipping will probably be great. Already it is known that over 100 lives and $1,000,000 worth of property have been lost. Wednesday night and Thursday snow fell over the northern part of the Middle and Eastern States and rain deluged the rest, while high winds were everywhere prevalent..... .....Of the "boodle" aldermen of this city, McCabe has been declared insane, and McQuade is now on trial. Waite, Fullgraff and Duffy have turned State's evidence and testified that 13 of the Board of Aldermen of 1884 (24 in all) conspired to vote away the franchise of the Broadway railway for a bribe of $20,000 apiece, and deputed "Billy" Moloney, clerk to the Board, to get other votes to override the Mayor's veto. These were obtained. States prison appears to be the certain home of all the boodle takers and givers who have not already fled from the country, unless some may manage yet to escape, forfeiting their bail of $40,000. .. ..The Chicago stock-yard strike has ended. Powderly, a week ago, ordered the men to return to work, and after considerable grumbling by some extremists, they obeyed. The packers, however, refuse to discharge the new hands they have taken on; and on this account and because the supply of hogs has been short, not much over one-third of the old hands have yet been taken back. The best and least turbulent men have been selected. All have to sign a contract that they will not quit work again without giving a fortnight's notice in advance, and each has to make a deposit of $50 as security that he will keep his pledge, the packers paying five per cent. interest thereon. Many of the new hands, or "scabs," have quit work, as they are afraid of violence from the old hands, who show their ill-will plainly, though as yet they have committed no violence. They are very much discontented at the new regulations, and the trouble may be renewed. Doubtless the new hands will soon all disappear..... .....

Acts like a Charm.

FROM the record of cures of Asthma, sufferers may rest assured in Compound Oxygen they will find at least relief, and, in reasonable probability, perfect cure. Not all have been cured who have tried Compound Oxygen, but all have found relief.

Mrs. E. A. Porter writes from Hydesville, Cal., Nov. 24, 1885: "It is now seven months since I received the first treatment for my son's use, and he has not had symptoms of a return of the *asthma* since taking the first dose. I take pleasure in recommending it to all my friends who are afflicted with any chronic disease. It seems to act like a charm on the disease peculiar in this climate."

A monograph on Asthma, with many other reports, and a brochure on Compound Oxygen of nearly 200 pages, will be sent, postpaid and free, on application by Drs. STARKEY & PALEN, 1529 Arch Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, November 20, 1886.

SOME English producers lately sold potatoes in London at $4.97 per ton. The expense of shipping and selling was $7.66 per ton, or $2.69 per ton above the returns from the sale. At Chester, near Liverpool, potatoes were selling for half-a-cent a pound a fortnight ago..... .. ....The National Bureau of Statistics says that not more than 1,000 buffaloes are now in existence..... The Vermont Legislature has just passed a bill providing that all hotels and restaurants using oleomargarine shall put up large signs notifying the public of the fact. .....At a meeting of the Cotton Factors' Association at New Orleans, Monday, it was unanimously resolved that charges for storage, drayage, weighing and labor on all cotton received from and after that date, when sold and delivered within 60 days, be reduced from 75 cents to 60 cents per bale. The Commercial Press, an independent establishment, reduced the charge for storage, for 60 days, from 50 to 40 cents; compressing from 65 to 50 cents; drayage to ship 25 to 15 cents and 18 cents per bale. This will force a reduction of excessive charges on cotton at other Southern ports also, much to the benefit of planters.... ....Prof. Wiley, chemist of the Department of Agriculture, telegraphs that the yield of 83 tons of Louisiana sugar-cane by the diffusion process was 11,100 pounds, or 134 pounds per ton of "first" sugar, instead of 80 pounds to the ton, as he telegraphed last week. This he considers a phenomenal yield, being, as he states, about double the ordinary yield obtained by the old milling process with the same kind of cane. He will boil for "seconds" at once..... .. According to the Philadelphia Textile Association, the estimated wool clip of the United States for 1886 is as follows:—Unwashed wool, 227,101,580 pounds; washed wool, 55,229,446 pounds; total, 282,331,025 pounds. The number of sheep is estimated at 48,332,331..... On November 15 a company of soldiers was ordered to Caldwell, Kans., from Fort Reno, to keep prospectors out of the Indian Territory. The greatest excitement prevails. Thousands of claims have been staked out in the Territory below Caldwell, where silver is believed to exist in large quantities..... In his fourth annual message, Chief Bushyhead, of the Cherokees, recommends that the 30 Indian tribes in the Territory form a confederation for the purpose of anticipating and resisting the passage by Congress of an act creating a Territory out of "No Man's Land" and portions of Indian Territory..... The lungs of the cattle in Clinton County, Ind., where pleuro-pneumonia was reported to be rapidly spreading, are found to be full of worms about the size of a cambric needle, which had eaten out chambers in the lungs and built up partitions. Parts of the lung would be hardened and often the air-cells closed. The pleura, however, was found to be in a normal condition and there were no adhesions either of lung or pleura, as would be expected in a case of genuine pleuro-pneumonia. Great alarm is felt among farmers over the progress of the plague.....A Newburg (N. Y.) pumpkin is said to have grown to weigh 250 pounds by being fed on milk. One of the roots rested in a pan of milk, of which it consumed a pint a day..... ....The crop of apples in Great Britain averages 85,000 tons, valued at $50 per ton; about 12,000,000 gallons of cider are made yearly. The production of cider in France averages 220,000,000 gallons. The orchards of Great Britain cover 180,000 acres; an acre with 40 good apple trees will produce 1,200 gallons of cider. Great Britain imports 900,000 barrels of apples yearly from the United State and Canada.....

Hoarseness Promptly Relieved.

The following letter to the proprietors of "*Brown's Bronchial Troches*" explains itself;

CINCINNATI, OHIO, April 12, 1884.

"*Gentlemen:—The writer, who is a tenor singer, desires to state that he was so hoarse on a recent occasion, when his services were necessary in the church choir, that he was apprehensive that he would be compelled to desist from singing, but by taking three of your 'Bronchial Troches' he was enabled to fully participate in the services. Would give my name, but don't want it published.*"

"*Brown's Bronchial Troches*" are sold only in boxes, with the fac-simile of the proprietors on the wrapper. Price 25 cents.—*Adv.*

Crops & Markets.

SATURDAY, November 20, 1886.

Foreign markets have been generally firm during the week, though prices have not advanced. Farmers' deliveries in the United Kingdom have declined. In France wheat-sowing has been practically completed under generally favorable conditions. Farmers' deliveries of wheat have increased and values have improved, and the trade is very firm. There is little likelihood of anything being done about the raising of duties on grain in France prior to January. In England the quiet markets, despite the low stocks and reduced deliveries, are attributed to milder weather, weakness of quotations here, and the

For PITCHER'S

CASTORIA

A Practically Perfect Preparation for Children's Complaints.

increase in the American "visible supply," the increase in the bulk of breadstuffs afloat, and "the withdrawal of French buyers from the cargo trade." Shipments of wheat from India have greatly declined, and Russia cuts no particular figure as a shipper at this time. The opinion is offered that heavy exports from those countries are not likely to be made again until the price is higher.

Our wheat crop was large, but we have already sent a goodly portion of it to Europe. The export clearances of wheat and flour from four Atlantic ports Tuesday were equivalent to 491 000 bushels of wheat. The quantity of wheat exported in the first four months of the current fiscal year—July, August, September, and October—was 52,001,482 bushels, flour included at the rate of four and a half bushels to the barrel. In the corresponding months of last year the quantity exported was less than 26,000,000 bushels, and for the entire year the wheat exports amounted to less than 95,000,000. It does not seem probable that the export movement will become less active during the remainder of this year, for the local effect of short crops abroad does not appear to have been fully realized thus far. Foreign consumers are fortunate in having been able up to this time to get American wheat at low prices.

During the four months since harvest, the northwestern receipts of grain have been about 120,000,000 bushels, shipments 85,000,000, and Atlantic receipts nearly 80,000,000, the last in excess of any year since 1881. The movement to the sea-board is now declining, and the receipts for the last week in October were small. While the stock of grain at Northwestern ports is 30 per cent. greater than that of last year (nearly all the excess being at Duluth), the visible supply at those points of wheat is only about 10 per cent. larger than it was last year, although the total crop of wheat was 30 per cent. larger. The London market seems favorable to higher prices for wheat, but hitherto it has "kicked against" every attempt at an advance.

The butter situation has not changed to any material extent and there is no improvement noticeable. There is a little demand for fancy Elgin creamery, but otherwise the market is decidedly dull and in some cases depressed. The inquiry for exports is very limited.

State, new dairy fancy	21@21	22@23½

Exporters of cheese have not done much for the past day or two and the market is rather weak with a tendency toward lower figures. Cable advices, however, are firm, but this is not reflected in the buying of exporters.

The marketing of hogs has been unusually small during the week, aggregating only 230,000 at the nine chief points against 440,000 for the corresponding week last year. There was somewhat of a gain at other places. At Chicago the deficiency was greatest, as hogs were held back on account of the strike, apart from this, the shortage is due to several causes: Owing to the drought, hogs in many places were marketed very closely last Summer; the weather has been very favorable for feeding, and as prices have been lower than farmers expected, many prefer to keep on feeding than to sell at current figures. There is an unsettled feeling as to future prices, due mainly to the uncertainty with regard to future labor troubles. There has been a very heavy export movement, especially in lard. Compared with a year ago January pork is 50 cents higher, lard 25 cents. per 100 pounds lower, and sides 32½ cents higher, while green hams are $1 per 100 pounds higher; hogs are about 20 cents per 100 pounds higher.

In wool, the only important feature in Boston during the week has been a liberal movement of Territory stocks, which have weakened lately and are going off freely. Fine medium wool is by no means strong as a year ago on account of diminished request. Delaine is weak and lower, but combing wool is in excellent demand and sales of exceptionally good lots have been made as high as 42 cents. In other departmets there is no quotable change. The current prices for leading sorts are as follows in comparison with last year:

LATEST.—Raw wool continues dull, though stronger at the interior and abroad than at domestic seaboard markets. Hogs are higher at Kansas City and pork is expected to follow, though speculation in hog products has not been active. Wheat has been a little firmer and more active, but prices are still below the level anticipated, owing to the enormous stocks in sight and heavy receipts.

MARKETS BY TELEGRAPH.

SATURDAY, November 20, 1886

CHICAGO.—Compared with cash prices a fortnight ago, No. 2 Spring Wheat is ¼c. lower; No. 2 Red, ½c. higher. Corn, ¾c. higher. Oats, ¼c. higher. Flaxseed, 2c. higher. Pork, 10 to 20c. higher. Cattle, somewhat lower. Hogs, from 10c. to 40c. higher, according to grade. Sheep, steady.

MADE BY HAUCK AND COMSTOCK MECHANICSBURG PENNA

For the Young.

HERE is a right way and a wrong way to blow out a lamp. Some people never turn down the light before blowing it out. They just blow down the chimney as hard as they can. Some day they will blow the light down into the oil and blow themselves up at the same time. The safe way to put a light out is to turn down the wick and blow across the top of the chimney. It takes a little more work perhaps, but it would pay better to follow this practice for 500 years in safety, than to have one explosion as a result of the wrong way.

LAST Summer I saw a man doing a good business at selling ice cream to newsboys. He had a box on wheels in which were two large cans for the cream. This cost two cents per glass. The glasses were pretty small, too. No spoons were provided. The boys licked the cream out with their tongues. They seemed to enjoy it too. This week I saw the same man with the same box on wheels. Instead of the cream he had a large can of baked peas. These were sold at two cents per plate. Each boy had a tin spoon and a little plate and the way the peas went out of sight was a wonder. The box was surrounded by a crowd all through the dinner hour. Most of the boys held their spoons in the proper way, and none of them ever tried to cheat. Baked peas are good. Many people prefer them to baked beans.

WHILE I was waiting for a train at a little station on one of the great rail-roads, I noticed a young man, evidently not used to traveling, who was also waiting for a train. When the train came along, we both got on board. Pretty soon the conductor passed through the train collecting the tickets. When he reached this young man he said: "You are on the wrong train, you want to go West, and you are going East at the rate of 40 miles an hour." At the next station he got off, saying that he would find out where a train was going before he got on board again. I could not help thinking that a good many people were just like him, on the wrong train and being hurried in a direction they did not want to go. I wish all my boys and girls would ask themselves what direction they want to go, and then ask themselves if they are on the right train if not, don't lose any time in getting right. A good many folks get started in life the wrong way, just because they don't look ahead a little. Keep your eyes open.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

"The worst about this is," said Johnny, with a choke, "that I figgered on helpin' my mother big some day. When I got big 'nuff I wuz gonter take her outer the County house an' sorter start a new home. Me an' her wuz gonter to keep house—now we can't do nothin.'"

"That's so," said the director, kindly; "but here's something else. She had a hard time here—now she has a good deal better place than you could give her. She can see you, too, and when you come to be a man she'll know it all, and you can fix things just as you think she'd like to have them. You wouldn't want her to wait in the County house till you got to be a man, would you?"

"I reckon not," said Johnny, after a long study.

There was no danger of our riding by the County house. We knew it at once. There was no look of the home about it. It seemed as though the people that lived there had given up all hope. The blinds at the front were all closed—paupers had no need of parlor or sitting room. There was no path up to the front door. Paupers must go in at the back door. They could not be choosers. The fence was falling into ruins. Two black hogs and an old cow went wandering about the yard. Several ragged men stood about the door as we drove up. There was no mistaking the place surely. A little white-haired man came hobbling down the worn steps as we halted. He beckoned to us with one hand and pointed over his shoulder with the other.

"Walk right inside," he said in a squeaky voice, "the mourners is all on hand, an' the funeral's gut ter begin to ouct, 'cause Mr. Jones he aint no hand fer waitin'."

He stood by while we fastened the horse, and then hobbled back to the door and ushered us into a large bare room, where the funeral services were to be held. Johnny kept close by the director. He did not cry any more. He took off his hat and let the great white brush of hair stand up about his face. We sat down on some rough looking chairs at the front

A pauper's funeral! It is hard to think of anything more sad, more desolate, and yet with less to regret. There were sincere mourners in this bare room. These poor, childish, wrecked paupers, children of charity, mourned the loss of their friend. They could not ask her to come back, they could only feel glad that she had escaped the wretchedness of their lives, and yet her death had taken something away from them—they could not tell what it was.

The rude coffin was placed on two chairs in the center of the room. The sun straggled in through the broken blinds and fell upon the thin white face that looked up at us from the coffin. The paupers were crowded around the room. They were mostly old men and women. What a place in which to pass the years of life that ought to be the best of all. There were a number of children too—like Johnny, ragged and unkempt. A foolish girl sat on a seat by the door and giggled and cried by turns. At one end of the room sat the keeper of the County house and his family. He was evidently in a hurry to have the services concluded, for he looked at his watch several times and at last nodded a little impatiently to the minister who sat by the side of the coffin.

I did not like what the minister said very well. His great desire seemed to be to make everybody cry. He seemed to be well satisfied when the paupers began to sob. It seemed to me that he made death appear just as sad and bitter as he could. I don't think that is right. At such times people need strong and hopeful words that will not make them cry, but will give them courage. I was surprised that Johnny did not cry with the rest. He sat and watched the minister with his eyes wide open. At last the minister paused, and nodded to an old man who sat near him. At this motion the old pauper rose and came feebly tottering forward. He placed his hands on the side of the coffin to steady himself, bowed his head till the long, white hair nearly touched the white face so near him, and in a voice that trembled with age prayed as only a pauper with his past dead, his life a wreck, his only hope in death could pray. The sun glittered on his white hair, and seemed to surround his face with a glory. The paupers hid their faces in their hands in the hopelessness of their grief, and even Mr. Jones forgot the pressure of his business and listened attentively. After the prayer, the old man who had met us at the door, stood up. He seemed to consider himself manager of the services. He wiped his red eyes with one sleeve of his ragged coat, while the other brushed back his white hair. As he did this, he said in his squeaky voice, "Them as wants to look at the remains will walk 'round this way an' out yon door."

He indicated the direction by limping over the desired route himself. The others followed him. We went last of all. The director lifted Johnny up a little so that he could see better. Johnny reached out his hand as if to touch the thin face, and then suddenly withdrew it. He looked wistfully at us and then slowly followed us out of the room.

On the way back to Bear Creek Johnny sat studying and pondering over something.

"What are you thinking about?" said the director at last.

"I wuz thinkin' of somethin' that happened onct. Ez long ago ez I kin remember, I got sorter hurt an' run in ter my mother. I found her asleep and I hated so ter wake her up that I didn't say nothin', and found out I want hurt much after all. My father, he said I must allus do that—sorter make it as easy for her ez I could. When I come to that coffin it 'peared ter me jest ez ef she wuz asleep again, an' ez if it would a ben sorter mean fer me ter wake her up in that County house. So I didn't say ner do nothin'. I expect that's the best way."

That night Old Johnson did much to atone for his treatment of Johnny. He fed the calves himself, brought in some of the wood and never once joked the little boy. He gave him the largest piece of pie, too.

The next mornin' as we went to school together, Johnny said in confidence: "I don't reckon I'll lick old Johnson after all. Like enough he don't mean nothin'."

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: Our first snow fell today and I have the whooping cough so I could not go out and play in the wet snow. My brother George and I topped six barrels of carrots. I learned to milk this Summer. The Garden Treasures did not do well as it was so dry. George is seven years old and wishes to know if he can join the club or is he yet too young? Your nephew,

JOHN SCHOENFELD.

[George can join. I am glad you kept out of the wet snow. I guess your wrists ached when you began milking.—U. M.]

DEAR UNCLE MARK: It is a long time since I wrote to you. I planted the sweet peas you sent me in a bed of loam. They grew to be about three feet high. The flowers were very nice through the Summer. The corn did not do very well. We are setting out an orchard of apple trees, when is the best time to set it out, now or next Spring? We have a dog named Prince and he will sneeze for his dinner. I have a cat named Mollie, and she will sit on a chair and rub her nose on the back of it when she is hungry.

Wolf Island. BYRON IRVINE.

[It is pretty late to plant the trees now.—U. M.]

DEAR UNCLE MARK: As I am not going to school I will write to you this afternoon. We have trouble in our school. The two directors hired a teacher and nobody else wanted her. The whole District was against her. Uncle Mark, do you think that was right? My brother started for Nebraska Monday evening; he is going to school this Winter. We are having beautiful weather now. My other two brothers are husking corn. Ma and I have been busy cleaning house, but it is done now. Last Sunday, after church, I saw a couple of young ladies baptized in the Mississippi River. Yours respectfully.

Henderson Co., Ill. BERTHA L. BANTA.

[Uncle Mark couldn't say about the school without knowing more about it. Sorry the trouble occurred. You ought to have a good school.]

DEAR UNCLE MARK: I received the sweet pea seed you sent me and return thanks for them. They bloomed a little about the first of July, but they were not very pretty, and there were not many blooms. I do not think they will do well in this climate because we tried some before and they did not do much. My father gave me one Bird Cantelonpe hill, and I raised one melon that weighed 11 pounds. I thought that was too light to get the prize but I see in the RURAL that the heaviest one only weighed nine pounds. I sold $1.46 worth of Cantaloupes this year. We have been pretty well shaken up down here by the earthquakes. I raised some popcorn this year and it turned out pretty well.

Your nephew,

Henderson N. C. ABRAM H. PRINCE.

[The prizes have not been awarded yet. You will see about them December 1. I guess you had a pretty hard shaking.—U. M.]

DEAR UNCLE MARK: I have read the letters of the Cousins with much interest, and I thought it was time to add my mite, and so I come knocking for admission into the Y. H. C. Will you let me come in? Perhaps, Uncle Mark, you have not heard of the famous Cheshire Decorated Cart and the Cheshire Grange Statue; at least, all of the Cousins have not, so I will write and tell them about it. The Cart belongs to the Farmers' Club of this place, and was made for exhibition at the Connecticut State Fair at Meriden, where it took first premium. The design was an immense horn of plenty with vegetables of all descriptions pouring from its mouth. It rested on a bed of flowers, and was surrounded with all kinds of vegetables. The sides of the Cart were fringed with grain, and festooned with strings of apples, and ears of corn. It was considered very fine. The Goddess of Grain was sent to the State Fair by the Cheshire Grange (of which I am a member) and was thought the most artistic work of the kind ever seen in New England. The statue stood on a pedestal which rested on bales of hay, and was 15 feet high. The Goddess held a sickle in her right hand, and in her left a wreath, all made of grain. Her robes were made of heads of grain. Her face and arms were covered with very fine seeds, and her hair was made of corn silk. The pedestal was covered with ears of corn split in two, and tacked on. It had also figures worked on it with different kinds of seeds. The Cart and Statue were invited to the New England Fair at Boston, and also to several fairs in this State. Uncle Mark, you ought to have seen the Cart and the Goddess. I would like to say to N. C. Rigg, that if he would like me for a correspondent, and will write, that I will reply, as I live in a distant State and am about his age. M. C. HOTCHKISS.

West Cheshire, Conn.

[I wish we could see that Cart.—U. M.]

DEAR UNCLE MARK: My Grandpa has taken the RURAL longer than I can remember. I have been reading the letters from the Cousins for some time. We live on a farm of 83 acres. It belongs to my Grandpa. My Pa farms it on shares. Our corn was good; the oats were a fair crop; wheat was poor on account of freezing out in the Winter. Pa has a Jersey heifer. We call her Nelly. I have one bird, two rabbits and five bantam for pets. We raise Plymouth Rocks and Wyandotts and Black Javas, and Rouen Ducks.

Yours truly. EDNA VORHES.

Harrison Co., Ohio.

DEAR UNCLE MARK: My Papa takes your paper, and I would like to be a Cousin. I live 10 miles below Parkersburg on the Ohio River. It is just a little way to the river from our house. I live on a large farm in the country. My Papa had about 1,500 bushels of apples this year. I have three little sisters, and they are all full of mischief as they can be. I go to school. Our teacher's name is Miss Mary Ames. I have a cousin from Parkersburg visiting me now. I planted the Garden Treasures, but few came up. I am 12 years old. I took music lessons this Summer and I had to go three miles to my teacher's house. I want to be a music teacher if I can, for I like music so well. We have a melodion. Your niece, CORA OAKES.

[I am glad you like music. If you are going to be a teacher be sure and make a good one.—U. M.]

DEAR UNCLE MARK: I am 13 years old and live on a farm of 10 acres. We have 13 cows, and four calves, two horses and about 25 hens. I live 2½ miles from school and have only missed two days since Sept. 7th, 1885. I like to read the Cousins letters, also The Story of a District School. In the seeds that were sent to Papa, there were some Cantaloupe seeds, which were planted and we had one weighing 10¾ pounds. The watermelon seeds did not do very well. There were eight kinds of flower seeds that came up. The Alaska peas did well; the Angel of Midnight field corn did well, there was one ear of the corn which measured at husking time 12 inches (but now only 11½ inches) and containing 456 kernels. I want this to be entered in for the prize. Out of 60 kernels sent us there were 105 ears 20 of which measured over 10 inches long and the remainder over six inches long.

Yours truly.

Vestal, N. Y. BERTIE LA GRANGE.

[I will enter the corn.—U. M.]

DEAR UNCLE MARK: I am a little boy 10 years old and would like to join the Y. H. C. I am much pleased in reading the letters from the Cousins. Papa takes the RURAL and likes it very well. We planted the corn and one ear measured 12⅛ inches. We planted the Garden Treasures and they were very nice. We have five head of cattle and nine pigs. Papa has taken two cows for a year and they give but little milk. I don't think it pays, do you? I have five sisters. Ma has been sick for two months and I hope she will get well before long. If you think this is worth putting in your paper, I will write again.

Grant Co. Dak. SEARS W. BARDINE.

[I don't think those cows will pay very well. I do hope your mother will get well soon. I guess she will, too.—U. M.]

Catarrh Cured

Catarrh is a very prevalent disease, with distressing and offensive symptoms. Hood's Sarsaparilla gives ready relief and speedy cure, as it purifies the blood and tones up the whole system.

"I suffered with catarrh 15 years. I took Hood's Sarsaparilla and now I am not troubled any with catarrh, and my general health is much better." I. W. LILLIS, Chicago, Ill.

"I suffered with catarrh six or eight years; tried many wonderful cures, inhalers, etc., spending nearly one hundred dollars without benefit. I tried Hood's Sarsaparilla and was greatly improved." M. A. ABBEY, Worcester, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

PERSONALS.

J. H. PULESTON, of London, Eng., has bought for $1,037,500 the S. J. Rose domain of 1,950 acres, near Los Angeles, Cal.

THE President has invited his sister, Miss Cleveland, to take a Christmas dinner with him at Oak View, the latest name for his country place, Pretty Prospect, or Red Top, and she will probably remain some time thereafter.

THE nurse of the baby Alfonso XIII. of Spain is a famous girl now. When the royal youngster received his three decorations from the King of Portugal she exclaimed: "Now I trust his little Majesty will keep his nose clean."

GEORGE W. BAXTER, the new Governor of Wyoming, is a very young man, not over 30. He is a son of Judge Baxter, formerly Governor of Arkansas, and one of the principals in what was known as "the Brooks-Baxter war" in 1874 in that State.

DR. WARREN, an associate of the Washington Ornithological Bureau of the Agricultural Department, says that hawks and owls feed on mice and insects, and not on poultry as has been commonly supposed! In examining a number of the stomachs of these birds he found no poultry.

WALTER S. GORDON, brother of Governor Gordon, of Ga., who recently died, amassed three fortunes in six years. He and his brother realized in the Georgia Pacific $167,000; in the Shellield they cleared $100,000, and shortly before Walter's death they sold the Indiana, Alabama and Texas Railroad for $150,000.

LETTERS which have been published in Paris reveal the fact that the Comte de Paris visited the Bartholdi Foundry in 1878 and subscribed $1,000 toward the cost of the statue of Liberty. In the letter accompanying the gift the Comte said he took the greatest interest in everything contributing to the union of France and America.

WHEN Rev. Sam Jones, in Omaha, Neb., asked any man present who had never spoken a cross word to his wife to stand up, a round-faced, good-natured individual, with a beard, stood up. "Thank God, there's one man who never said a cross word to his wife!" said Rev. Sam. "I'm a bachelor!" shouted the round-faced man.

GOVERNOR GILBERT PIERCE, of Dakota, who was appointed by President Arthur just after the Chicago Convention, has again tendered his resignation to accept the managing-editorship of the St. Paul Pioneer-Press, at a salary of $5,000 a year. He is a Stalwart Republican, and tendered his resignation upon the incoming of the present administration; but was asked to hold over as a personal favor to President Cleveland, as no better man could be found.

MISS WINNIE DAVIS'S first appearance in public was at the laying of the corner-stone of the Confederate Monument at Montgomery, Ala. She had previous to that time lived in privacy at Beauvoir. On the trip from Montgomery to Atlanta, after the laying of the corner-stone, Gen. Gordon presented Miss Davis to a crowd at Newman, Ga., as "The Daughter of the Confederacy," a title by which she is generally known in the South.

PRINCE FERDINAND, of Hohenzollern, of the elder and Catholic line, has been chosen by his uncle, King Charles, of Roumania, as his heir, for Charles is childless. This was arranged a year or two ago, and the prince, who is 21 years old, will soon leave his Prussian lieutenancy and become an officer of the Roumanian army. It is said that when he took his leave of Kaiser Wilhelm the old man said: "I think thou hast had more pleasure in Potsdam than ever thou wilt find later down in Roumania."

PRINCE NICHOLAS, of Mingrelia, Russia's candidate for the sovereignty of Bulgaria, is 40, a colonel in the Russian army, and aid-de-camp to the Czar. He is the divorced husband of a daughter of Gen. Count Adlerberg, ex-Minister of War. He has a 10-year-old son, and is somewhat of a favorite in St. Petersburg society. Mingrelia is a part of ancient Colchis in Asia, between Circassia and the Black Sea. Its area is about 2,600 square miles, mostly mountains and swamps infested with malignant fevers—a savage country with no roads and hardly any improvements. Its 240,000 inhabitants are physically and mentally the lowest type of Georgians. It was conquered in 1801, but the Prince was allowed a limited rule till 1867, when the father of Nicholas was altogether turned out, but consoled with a bounty of $750,000.

Humorous.

THEN AND NOW.

WIFE.

Now don't you think it is a shame,
To let Marla stay
So late with Charles upon the steps?
What can they have to say?
Such goings on, as I'm alive,
'Tis nearly midnight hour
I wish, to drive her in the house,
Would come a heavy shower.

HUSBAND.

It is indeed, a sad, sad thing,
That she should be so late.
But hold, it's not so many years,
Since I leaned o'er the gate,
And when I said, "Good night, good night,"
So many times in fun,
You would not let me go, you know,
Until the clock struck one.—*Phalanx.*

AN autumn idol—The oyster.—*New Age.*

VOL. XLV. No. 1923. NEW YORK, DECEMBER 4, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered according to Act of Congress, in the year 1886, by the Rural New-Yorker in the office of the Librarian of Congress at Washington.

The Herdsman.

AYRSHIRE CATTLE.

AMONG the various breeds of cattle whose merits for the shambles or the dairy have justly won them popularity, the Ayrshire is of the most recent formation. The nineteenth century was from 10 to 15 years old before the cattle of Ayrshire, which have since become known by the name of the county in which they originated, are known to have possessed those distinctive characteristics and that power of transmitting them with certainty to their progeny, which would entitle them to be considered a breed. The changes effected in the appearance of the Ayrshire within the last 50 years have been considerably greater than in cattle of any other well known breed; for in this period the improvements made in Ayrshires have been of a more radical nature than those effected on any other breed. As may be inferred from its recent formation, it is preëminently a breeders' breed, owing its origin less to environment—surrounding conditions—and more to care and judicious selection than any of the other well known breeds. More than a century ago, it is true, the rough cattle of Ayrshire had a local reputation for hardy and deep-milking qualities, but the meagre descriptions that have come down to us from those days show that they differ greatly from the Ayrshires of to-day. It is generally believed that the cows from which both they and the Short-horns are descended were the country cows belonging to the district between the Wear and the Tees, and it is quite probable that some of these cows—immemorially good milkers—were bought by Scotch dealers or drovers when returning north after disposing of their "drives" of black cattle in England. On the cows thus introduced, it is very likely that West Highland bulls were used for crossing; for cows of that breed have always been good milkers, and the Ayrshires of to-day often in color, and always in the size and shape of their horns, afford clear evidence of West Highland blood. Moreover, both breeds are spiteful and pugnacious in disposition, and ever ready to gore or rip up each other whenever a chance offers, even when bred together. The Jersey, Guernsey, Short-horn, and even the Holstein are all supposed by different authorities to have contributed either by direct crosses on the original rough, but hardy, stock, or by "dashes of blood" to the formation of the breed, and some of the distinctive traits of all these breeds occasionally, by atavism, crop out in the modern Ayrshires.

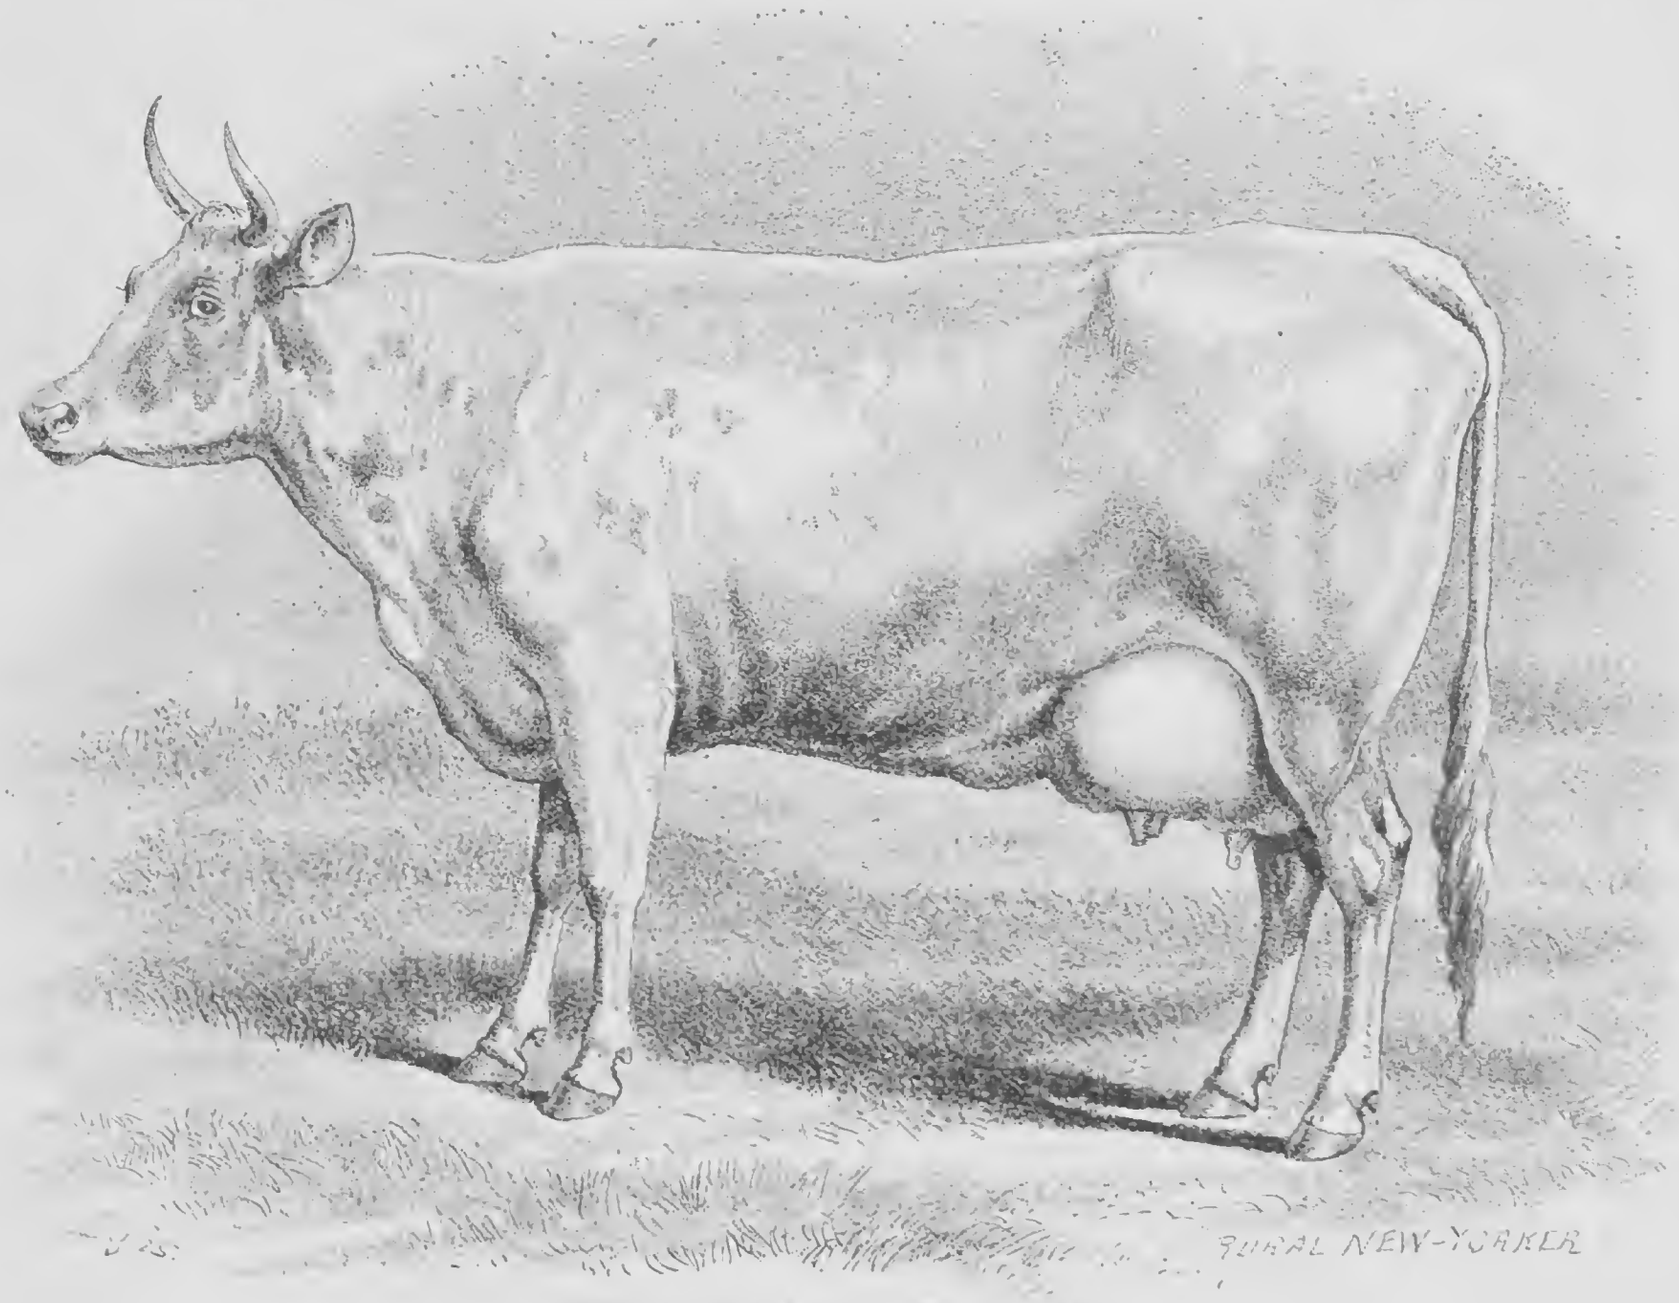
Medium in size, short in the legs, excellent foragers, with clean, strong bones, and not a pound of superfluous flesh, cows of this breed thrive and give large messes of milk where less hardy animals, with less activity and more fastidiousness, would hardly pick up a living. Ayrshires are considered specially valuable where the pasture-land is not of first-class quality, for their mouths seem to be harder than those of Short-horns and most other breeds, and they do well on dry, wiry pastures on which the more aristocratic cattle would starve. On second or third-rate land heavy, costly cattle require much extra care and artificial food or they will certainly lose money; but on such land Ayrshires do well. But, although these cattle manage to thrive on poor pastures and scanty fare, they make a generous return for abundant food and good treatment. Under such circumstances, the milk records of Ayrshires compare very favorably with those of any other breed, and in comparison with the amount of food consumed, good judges, speaking from experience with this and other breeds, declare that cows of no other breed can compete with these. Under the microscope their milk is found to be rich in caseine, and the cream globules are numerous but very unequal in size. This is considered a defect in the Ayrshire as a butter-cow, for the cream doesn't rise well when the globules are unequal in size, and it requires skillful churning to get all the butter out; yet on both sides of the Atlantic many butter-makers are quite content with the proceeds of their herds of this breed, although it is true their reputation for cheese is still higher.

When in milk, the Ayrshire is an excellent machine for converting all her food beyond the economical requirements of her system into milk. She lays on little or no flesh; all that goes into the mouth, beyond what is needed to run the machine, is poured into the milk pail. When dry, however, and well fed, she readily takes on flesh of an excellent quality, in which fat and lean are much more evenly intermingled than is generally the case in the distinctively beef breeds. Although the meat is not laid on so thickly in the choice parts as in the Short-horn, Hereford, or black polls, yet it always brings a good price, and, as a rule, the carcass weighs considerably more than the appearance of the live animal would indicate

At Fig. 442 is shown a typical Ayrshire cow. The favorite color is a light brown, or brown and white; some few are found black, or black and white, and now and then even a pure white is seen. Red and white, however, is the most common color; though there are a considerable number of red, or mostly red, some white and red, and a few flecked, but seldom or never is a roan-colored Ayrshire met with. The colors rarely mingle together, the line of separation being generally quite distinct. Some years ago an Ayrshire was hardly conceded pure unless it had a black nose, but now a white nose is not looked upon as a drawback, though dark-red or black noses are still the favorites. The udder is the chief point from which we can infer the milking capabilities of any cow, and especially of an Ayrshire. It should reach well forward, and be firmly attached to the body; it should be broad behind, without projecting too far, filling up well the space between the legs. It should not be fleshy, nor should it hang down loosely. The quarters should be alike in size, and the teats be set on widely and equally apart, not hanging down like a bunch of carrots under a loose, flabby bag. The head is preferably short; the forehead wide; the eyes rather small, but lively and intelligent; the horns set on wide, but inclining upwards and curving slightly inwards; the neck long and straight from the head to the top of the shoulder, free from loose skin on the under side, fine at its junction with the head, the muscles enlarging towards the shoulder; forequarters thin in front, generally increasing in depth and thickness backwards; skin rather thick, but soft and elastic; general form of the body, when viewed from the side, wedge-shape. This peculiar wedge-shape form, more noticeable on the Ayrshire than on any other breed, is due less to deficiency forward than to the large bulk of the carcass aft.

Great attention has been given of late years to the improvement of the breed in Scotland. An Ayrshire Herd Book has been established, milking competition, have been held, and an annual exhibition of cows called the "Ayrshire Derby," has attracted to Ayrshire many visitors from other parts of the United Kingdoms and the competition for the 38 prizes offered at the "Derby" has been very keen. Large numbers of Ayrshires are annually importeded into England and Ireland, and the Cork and Kerry Agricultural Societies have endeavored to promote the importation and breeding of these cattle by offering special prizes for them. Ayrshires were first imported into the United States in 1831; but the breed has changed considerably in appearance since then, especially in color. At first their flow of milk was less than in their native home, where the moist, uniform climate—cooler in Summer and warmer in Winter—making fresh, green pastures, was doubtless more favorable for milk secretion. The American Ayrshires of to-day, however, are thought to be fully as good as those in the Old Country, while the milk is said to be richer. Many experienced dairy farmers think no cow is equal to an Ayrshire for milk or cheese, especially under adverse circumstances—on hilly land, with scant herbage, and a climate subject to sudden and extreme changes of temperature.

Any faults? Yes; what is there in this sublunary world without some? The teats of young cows are generally too short for convenient handling; but with skillful milking they become quite long enough after the second or third calf. The sleepless belligerency of the cows is also a drawback; and knobs or other devices should be fastened to the ends of the horns to lessen the danger from this cause.



TYPICAL AYRSHIRE COW. Fig. 442.

LIVE STOCK NOTES FOR DECEMBER.

HORSES AND MULES.

"THE melancholy days have come, the saddest of the year" for a large proportion of the live stock of the farm, which are pinched with cold and too often with hunger. Horses, however, usually fare better than other stock, and yet in many cases their condition might be improved. Feeding should not be suspended because there is not much work to be done; but should be sufficient to keep the animals in good order and avoid losing flesh. Good hay is ample feed for horses that are not worked regularly through the Winter. Rye or oat straw cut up fine, wetted and mixed with from four to eight pounds daily (in two meals) of mixed corn and oats finely ground, will be quite sufficient for a horse at ordinary work. A feed of hay should be given at noon. Rain is worse than dry cold; a tight roof is better than tight walls; it keeps in the warmth and keeps the horses dry. In the South, where the Winters are mild, mules suffer most from the cold, heavy rains. Southern farmers should think of this and give their mules protection from the rains, especially at night.

The horse's frog is a natural provision against injurious concussions of the sensitive inner part of the foot. Hence it should not be cut away. It also prevents slipping upon ice, having the adhesiveness of rubber in such a case. It is necessary sometimes to use sharp, high calks for road horses; and when those are used never have the frog cut or even pared. If it projects beyond the shoe so as to reach the ground, so much the better for the horse.

For wounds with calks, which are apt to occur early in the season, apply an ointment made of four ounces of lard, one ounce of resin, one of turpentine melted and stirred together, with half an ounce of acetate of copper. Exposure to snow, or mud which hardens upon the feet and legs, is apt to cause mud fever. To avoid this, wash the legs of horses coming in from the road with warm water, and rub them dry. If the heels and legs become inflamed and sore the above ointment is an excellent application. It is not advisable to blanket a horse while in the stable. It makes him feel cold when he comes out. This is the time to use a blanket, if at all. A blanket to a horse is the same as an overcoat to a man. And above all things, a horse heated with driving should not be left standing exposed to a piercing cold wind. The custom of using a chest protector when a horse is at work is a good one, and will lengthen the life of the animal. It is a kindness to a horse to keep a stock of axle-grease on hand and use it. A useful mixture is made as follows: one pound of tallow melted, a pint of castor-oil and four ounces of black-lead (stove polish,) in powder, the mixture to be stirred until cold. It is cheaper and better than any purchased axle-grease.

COLTS.

Keep colts in stalls by themselves. Provide strong leather halters and teach them to be tied. This is their first lesson. Yearlings should have a quart of corn and one of oats twice a day if they are expected to grow. Thrifty yearlings should grow four inches taller this Winter, but they won't do it unless they are well fed. Mule colts eat but a little at a time, and should be fed three times a day. Watering twice a day is necessary. Very cold water is apt to give a fit of the colic, and when a colt shivers after drinking icy water a day's growth is taken out of him.

This is a good time to begin training colts to lead or to drive. Deal gently with the young things and teach them patiently. Remember how long it took you to learn your first lesson. A few roots or cut potatoes are excellent for colts and for horses too. Brood mares are much benefited by them. Carrots are the best, but mangels and sugar beets are very nearly as good. Southern farmers may feed sweet potatoes sliced to their colts and note how they will be relished. They are wholesome and nutritious for horses and mules as well. Give a warm bran mash to all the horse stock twice a week. Don't forget a handful of salt three or four times weekly. In wet weather, braid the tail and gather it in a bunch and tie it out of the way of the mud. Clip the hair from the heels and pasterns and keep these well greased. Provide clean litter in abundance and never let the animals stand in wet manure.

CATTLE.

Warm water is certainly a good thing for the cattle. Two pailfuls thrown into a water trough filled from a well will take off the chill and add considerably to the milk of the cows as well as to the fat of beef cattle, and will be very pleasant for the calves. Save the oat chaff from the thrashing for the cows; it will show in the milk pail. To throw good, clean, sweet straw under cattle seems to be a waste of what was made to be eaten and turned into flesh, milk, or meat.

Oxen that are worked on the road should be shod. Ready-made shoes can be procured for a dollar a set—16 shoes for the pair of cattle. The shoes save the cattle from sore feet and the owner from wasting time and a sore throat. Try and drive oxen quietly and without shouting so as to be heard half a mile away. It can be done. If not, drive them with ropes to the horns. Cut feed is better for cattle than long fodder and economical for the owner. One ounce of salt is a necessary requirement for each head of cattle every day. Water troughs should be provided in the yards, and as many as will give ample room and avoid crowding and fighting. One should be placed away off, for the weaklings, where master cattle will not trouble them. The owner should see, himself, that every cow and calf has its full supply of water every day; once at least. When cold rains are falling the cattle should be turned out for a few minutes only, and when brought in, it will be well to rub them dry. It is troublesome, but it is profitable. Racks for feed are as necessary as water troughs, and plenty of them should be provided. They save a good deal of fodder from being wasted. In fine weather the mid-day feeding should be given in the yard, and sufficient racks to insure that every animal gets its share should be furnished. Consider what convenience can be provided to save labor and time in feeding and to economize the fodder. A little brain work may save hand work and spare feed. Drain the yard well, so that the feet of the cattle are dry and the manure is not washed away. Don't forget that the calves will be pleased, and benefited too, with a thorough good carding occasionally.

SWINE.

Crowd the fattening pigs. As long as they will eat another ounce of corn and it is not given to them, time is lost, and time is money. The more quickly an animal is made fat the cheaper the meat is, for the less food is consumed. A good fire soon heats the kettle; but one may use the whole supply of fuel in keeping up a little fire without warming the water. It is much the same in feeding pigs. The right heat for the water for scalding hogs is 180 degrees. If the heat is greater the hair does not come off so freely. Where a large number of hogs are to be dressed, some regular system should be provided for handling them, so that two men can do all the work. It is quite necessary to keep fattening swine as clean as others; it is even more necessary; filth will flavor the pork; it can even be smelled in it. The filthy pens tend to make the meat unpopular, and cleanliness pays in many ways.

Keep young pigs warm. There is no better bed for growing pigs than a clean, earth floor, in a partly underground pen. If necessary provision is made for them, pigs are very clean animals, and their sleeping place is always kept clean when they can do it. Hence, they should have a chance.

Food that is somewhat acid, but not very sour, is better for store pigs than quite sweet food. The best and cheapest pork we ever made was fed with potatoes and corn ears boiled together, until the former were soft, when the whole was mashed and cooled and reduced to a thick mush. Give the brood sows, that are in-pig, a few cabbage or mangels. Sows thus fed never molest or destroy the young pigs when they are born. A bright, light pen with a dry, earthern floor, in which they can root and roll in the warm sunshine from some large, south window, is the very best lodging for growing pigs and sows. An outer yard and feeding place besides this are necessary.

SHEEP.

Protect heavy-wooled sheep from cold rains. The weight of the water held in the wool will sometimes prevent them from rising. It chills the ewes, and lambs are lost by it. An excellent feed for ewes and yearlings is a mixture of corn, rye and buckwheat in equal parts. When the farmer owns his own feed-mill, this grain should be ground as fine as possible and the meal given dry—four ounces daily are enough for a ewe to keep her in good condition.

A grain-mill is a good investment where 100 or 200 bushels of grain are fed yearly. It is not the saving of the 10 per cent. charged for grinding so much as the time in running back and forth to the mill, that counts for the profit. In feeding our sheep last Winter on grain ground at home, we found them to do better than previously on whole grain, although it is generally believed that sheep do their own grinding very well. Separate feed troughs for feeding meal were also found preferable to hay racks and grain troughs combined. Every sheep shed should be provided with eave troughs to carry off the rain water, and keep the shed and yard dry.

Look out for the "stretches" which will be known by the sheep spreading its legs out and stretching itself. It is constipation caused by dry feeding. The remedy is some bran mash and an ounce of raw linseed oil. Keep a close watch for anything wrong, find the reason of it and right it at once. Delays are dangerous with a flock.

POULTRY.

Fat turkeys are best marketed for Christmas and New Year's. For this purpose the birds are put up to feed at once. Three weeks are required. Corn meal in sweet skimmed milk, mixed thick, makes the sweetest and whitest flesh. Coarse corn meal given in water fattens ducks well. All fattening fowls should be kept in darkened coops, so they will not fret to get out and will rest and sleep. The coops for fattening birds should have a low door behind, through which the floor may be cleaned with a scraper. After cleaning, spread dry sand or sawdust over it.

Look out for lice, fleas and mites in the poultry house. Go in at night and handle a few of the birds, and you will quickly learn if there are any vermin about. If there are, use crude petroleum or grease and kerosene oil freely on the roosting poles.

THE CHICAGO FAT STOCK SHOW.

(RURAL SPECIAL REPORT—*continued.*)

Cattle exhibits; a Hereford the champion; curly-haired cattle; breed and family types; horse exhibits; carriage horses; sheep; swine; an unprecedented corn exhibit; a poor, uninstructive dairy exhibit; test churns; bogus butter in the fore-front; beef-dressing contest.

THIS is a success in the number, variety and quality of exhibits in the cattle, sheep, swine, horse, poultry, butterine, corn and dairy implement departments. All classes of live stock were indeed fat, many horses too much so, and the butterine contained a greater percentage of fat than any animal exhibited. One hundred and eighty cattle are shown, consisting of 66 Short-horns and grades, 53 Herefords and grades, 20 Devons and grades, 19 Aberdeen-Angus and grades, eight Holsteins and grades; the rest were nurse cows and calves. The grand sweepstakes prize has been given to a Hereford steer that weighs something over 1,500 pounds. He is of the celebrated "Rudolph" strain, has a thick coat of silky hair that lies in a curly mass not unlike the wool often found on a light, glossy-fleeced Cotswold sheep. His body is nearly a parallelogram—not a sign on his deep-meated carcass of the fat lumps so common to "ripe" cattle. Every Hereford, or grade Hereford, in the show that has the long, silky, curly coat approximates closer to the prize steer than do any of the sleek, short-haired ones. An Englishman just in from the Plains says: "You Americans won't buy the curly-haired Herefords, and there's where you make a mistake. When the snow falls on them they shed it like a sheep." The Short-horns present the same variation in hair, though not nearly so markedly. They are, perhaps, of more uniformly high quality than any breed exhibited. The Aberdeen-Angus are very compact, mature very young (several yearlings were marked as weighing over 1,000 each), have great width of chest and are superior in the hind-quarter.

A Nebraska ranchman says of them: "Coming as they do from the North of Scotland (No, Aberdeen and Forfar or Angus Shires are in about the center of Scotland on the eastern coast, facing the German Ocean), they are at home in a cold climate, and I find them great 'rustlers.'" A ranchman sets store by an animal in proportion to its ability to "rustle"—to fight against starvation in snow and cold. Standing by the side of the prize Hereford are two steers half Hereford and half Aberdeen-Angus, crossed in opposite directions. The one sired by a polled bull is horuless, and has the sire's color and contour, with the white Hereford face. The one got by a Hereford bull has the horns, white face and outline of a Hereford, but the body is black.

The Devons, a good lot, are evidently inferior in combination of qualities to either of the foregoing. The few Holsteins show the coarse bone characteristic of the breed, and are in no way remarkable.

A fat stock show is subject to too many contingencies to decide which is the best beef breed. An equal number of animals of each breed, of the same age, raised under the same conditions of climate and feed and selected from the *same class* in their breed, (an impossible thing) should be compared to form a just conclusion. By the "same class" I mean that the family type in a breed is of nearly as much importance as the breed type. A Short-horn from the best strain is better than a Hereford from a poor strain, and *vice versa*. If *thorough-breeding* means anything it means painstaking in selection of points or traits and fixing them so strongly that they become hereditary—both bad and good. Hence we have in the same breed of cattle, distributed among its several families, all degrees of quality for either milk or fat. Let the young breeder rest content with the best type of an inferior breed till he can get an equally good type of a better one, no matter what kind of stock he is breeding.

Two hundred and thirteen horses were exhibited. French draft, 61; English draft, 75; Cleveland Bay coachers, 15; French coachers, five; ponies, 31; and runners and trotters representing favorite strains.

The French and English draft horses are too well known to need description. The Cleveland Bay and French coach stallions are of comparatively recent importation, and but few of their get are old enough to show what prepoteney these breeds will exert when crossed on native mares. The Cleveland Bays are very uniform in size and color, have black points, average about 16 hands and give great promise of producing the size and style demanded for coach and coupé. The French coach stallions are both bay and sorrel; have an occasional white stocking, are more of the running horse type except the neck, which shows a trace of the Percheron arch. They are of lighter bone and have more spirit than the Cleveland Bays. Several specimens of both breeds are deficient in knee action, and some of the Cleveland Bays hugged their tails close. It is safe to say that there are among the representative trotting families many stallions that excel the imported coacher in style, are his equal in size, and much faster.

One hundred and eighty-one fat sheep are in the pens, mostly South Downs and their grades. There are also prime Oxford Downs, Cotswolds and Leicesters and Merino grades. The fattener of sheep has over the cattle man an advantage that he is not slow to appreciate, viz: the length of wool permits sufficient trimming to make the most ungainly animal symmetrical.

The 106 porkers that, like poet Lowell's pig, are "most too fat to snore," are about equally divided among Berkshires, Yorkshires, Poland Chinas and their grades. Ten Essex, seven Duroc and nine miscellaneous completed the list.

The poultry department comprised 350 coops which contained 1,009 specimens. Light Brahmas led with 198 birds; Plymouth Rocks, 195; Wyandottes 131. Most other breeds were represented. The show was chiefly by Illinois breeders with a sprinkling from Indiana and Ohio. The novelties were Rose-comb Black Spanish, Rose-comb White and Brown Leghorns; White Plymouth Rocks, and White and Golden Wyandottes—too many new breeds which in reality are simply "sports" and of very questionable value.

The corn exhibit is probably superior to any previous one in the whole country. Illinois leads with 59 clusters of yellow dent and 24 of white dent. Nebraska shows 66 clusters; Iowa 41; Kansas 32; Indiana 20; Ohio 10; and Missouri shows 11. The exhibits from other States not named comprise 61 clusters of dent and flint. A pretty effect is obtained by the artistic grouping of pop-corn ears and freaks of corn growth. Each cluster contains 20 pounds of ears, making a total of 6,580 pounds, exclusive of several interesting exhibits not hunched.

The dairy exhibit consisted of only about 70 cheeses, 75 tubs of butter, some 20 small packages in stone jars and wood and tin pails, three refrigerator and three glass case exhibits of prints, nine jars of granulated and a few fancy designs, including a medallion of Washington. Every arrangement conveyed the "touch not, taste not" idea, and consequently nothing could really be learnt from the display. The only information tendered was by the refrigerator, salt and butter color manufacturers.

The dairy implement department was replete with the usual variety of churns, coolers, salt, etc. The novel features were a simple method of churning samples of cream in glass tubes, and a cream separator on an apparently new principle.

The most artistic arrangement in the building was that of bogus butter, which was shown together with the crude materials by five manufacturers. The process was exhibited at every stage. Every one had a chance to taste and also take away a sample inclosed in a neat box, like those used for wedding cake.

In the cattle killing contests in one end of the exhibition building, the animal is knocked senseless, and then bled by sticking like a pig. The head is skinned and removed, the fore legs are skinned to the knee and cut off, one hind leg is skinned to the hock and cut off, the other is not touched. The animal is then on its back, and time is called. The contest ends when the carcass is skinned, raised, split, and washed. Each contestant has a helper who kills the animal and gets it ready for the start. He also hoists the animal as it is being split, and saws

the brisket and pelvis bones apart, and hands the splitting axe, but must not sharpen any knives. The quickest time made was 10 minutes 25 seconds in dressing a beast, and nicety of work counts more than speed. It is claimed that the same men can dress a carcass in "go as you please" style in three minutes and 40 seconds, and in "market style" in four minutes and 50 seconds. One man made 229 knife cuts and another 270 in skinning a carcass. H. J.

SCARCITY OF DONKEYS.

ONE thing that surprised me when I first came to this country was the few donkeys to be seen on the streets of American cities. In England and in Europe the hucksters all have donkeys, and many small farmers and milkmen find them valuable. Here these venders drive some crippled old horse about. A donkey would last longer, do more patient work, and cost less to keep. He is to a horse what a goat is to a cow. In proportion to his weight and the cost of his food he does far more work than a horse. An American farmer would be almost ashamed to meet his neighbors if he used donkeys instead of horses, and goats instead of cows, and yet there are plenty of places in this country where he could make far more money by keeping the smaller animals. ENGLISHMAN.

Sheep Husbandry.

Notes from the Western New York Farm.

SHEEP VERSUS COWS.

MAINTAINING THE FERTILITY OF THE SOIL.

LET no one for a moment suppose that in pasturing either sheep or cows, or in feeding them solely on what is grown upon the farm, anything can be added to the fertility of the soil. The animal is not an originator, it is only a machine, and as such is run by outside influences. It has no means of getting anything outside of what is taken in its food. Consequently there can be nothing in its products or its excreta aside from what is taken in—what is eaten or drunk—and if this comes solely from the farm, it contains nothing, except its carbon, but what was derived from the soil, and consequently the manure made by its consumption can carry back to the soil no element of plant growth not originally there. On the contrary, even with the best of care in saving and returning to the soil every particle of the manure, there is a constant and unavoidable loss to the farm. This arises from the abstraction from the food, of the nitrogen, phosphoric acid and potash, which are requisite to the formation of flesh, milk, bones, hair, wool, etc. When full-grown cows are purchased and are kept for butter making, and this is the only product sold from the farm, nothing but a mere trace of anything beyond carbon and hydrogen will be removed, and if the milk be judiciously fed to full-grown hogs for fattening purposes, nearly all its nitrogen and other valuable ingredients will be left in the manure, and if this be so saved that no loss occur by burning or washing, and if all of it be returned to the fields, but very little exhaustion of fertility should be the result—much less than when sheep are kept. In sheep husbandry the profits are made in raising and selling young sheep, and in the growth of the annual fleece. In both of these much plant food is taken away in the shape of bones, meat and wool, the constituents of which are largely potash, phosphoric acid and nitrogen, and even where the practice is followed of buying full-grown sheep and fattening them for the market, a large growth of wool takes place, and this is largely made up of the most expensive elements of plant growth.

So, while neither sheep nor cows can of themselves add anything to the fertility of the farm, it must be conceded that if both are kept according to the too common method of depending solely on the farm for what they eat, the cows will be far less exhausting where kept for butter making alone. But, where the milk is sold or taken to the cheese factory, or to the butter factory, and the skim-milk is not returned, the tables will be turned, for in the milk, aside from its butter, will be found in large proportion the very elements of plant food which go to make the carcass and wool of the sheep, and in many dairies the practice prevails of raising and fattening the calves. Where this is so, then the exhaustion is much more rapid with the cows. But the wise farmer, whether keeping cows or sheep, will supplement what is grown on his farm both in Summer and Winter by the use of bran, oil meal, corn meal and other foods, which are rich in plant food and which can be used at a profit, and when he does so, either class of stock can be kept not only without a loss, but with an actual and constant increase of the fertility of his farm, and of its productiveness, as a matter of course.

When this wiser course is followed there are some advantages in favor of the sheep, among which I will call attention to a few:—When running at pasture the droppings of the cows are mostly left in compact heaps, destroying the herbage upon which they may be and fouling that surrounding for a foot or more, so that no animal will eat it, and, besides this, they are mostly eaten by insects. The voidings, both liquid and solid, of the sheep are more easily and evenly scattered over the ground. They are never wasted by being eaten by insects, are never destructive to the herbage on which they fall, or avoided by the stock. They fall close to the ground, are readily within the reach of the plant roots, and are quickly made available in growing fresh food. The treading of the sheep is much less likely to poach the ground or destroy the sod over which they feed. In Winter, when confined in stables, the liquid voidings from the sheep are less copious than from cows, and are all quickly absorbed by the solid droppings, thus making the manure much pleasanter to handle and making their return to the field without loss much more certain: and when the stock are kept in open yards, subject to the rains and snows, the difference in favor of the sheep is still greater. Sheep will also work up the litter given them much finer than will cows, and thus make their manure more easily handled. It can be scattered and plowed under more readily, and be less in the way of subsequent cultivation.

* * *

COMPARATIVE PROFIT.—This is one of the most important points to be considered. Every man is entitled to a good living from his business, and, in addition, to a reasonable surplus to provide against old age and its contingencies. That neither the dairy farmer nor the sheep keeper has been adequately rewarded, for the past few years at least, is evident to every careful observer. The first has had to struggle against the unjust competition of the bogus butter and cheese maker. The latter has had equally as sharp competition in the use of shoddy and other worthless substitutes for wool by the dishonest manufacturer; not only have these substitutes supplanted the genuine articles in either case, but their use has greatly diminished the demand for dairy products and woolen goods by destroying public confidence. But, notwithstanding these obstacles, these branches of farming will, on investigation, be found to have paid as well as any other, if we compare periods of eight, ten or more years. And that they have not paid better is more the fault of those who follow them than of the times or markets. Dairy farmers have kept by far too poor a class of cows, and have not used sufficient care or skill in the production of butter and cheese to insure the finest grades and the highest prices; nor have they forced such cows as were kept to their maximum yield. The sheep farmers have paid more attention to the production of wool than to meeting the wants of meat markets, and even in this line they have not bred to the highest excellence: and in Winter they have treated the flocks too inhumanely to secure the largest yields or best quality of wool. While there are many exemplary exceptions, the average cow in the dairy districts does not give milk over eight months in a year, and does not make, on an average for the whole time, over five pounds of butter per week, and the average butter made does not net for the Summer over 15 cents per pound, thus yielding about $25 per cow, and if to this be added the net receipts for the skim-milk and the "deacon's pelt" the aggregate may reach $30. If for each cow were substituted eight sheep, the average receipts would be about 40 pounds of washed wool worth, at the low figures of the past three years, $10.80, six lambs should be raised annually worth $12, making an aggregate of $22.80; to compensate for the balance appearing against the sheep, there would be the lesser labor required and the fact that when the cows are old and no longer profitably productive, it is necessary to sell them at a reduction below the purchase price. While these figures do not make a very attractive showing for either industry, I believe they are not far from correct, as applied to the masses engaged in cow and sheep keeping. The notable exceptions above mentioned—where the receipts are more than double those here stated—only show what may be done. With proper business energy and forethought, and with the best of care, even the receipts and and profits of the best dairyman and sheep keepers may be greatly increased.

It is to be hoped that the oleomargarine bill will lessen the competition of the dairymen, and in the consumption of wool a more lively and largely increased demand is before us, in some measure the result of a change in the fashions to more woolen goods. The markets for the best grades of mutton are never overstocked, and I hope the prices and profits in both these branches of farming may be greater. While I can advise no one to change abruptly I would advise every man to study the capabilities of his farm and the demands of the markets just about him and most readily available, and it may be that in many cases a change is desirable.

* * *

It is now time to expect severe freezing any day, and when this occurs to such an extent that the clover leaves are broken where walked upon when frozen, the sheep should be at once gathered into the yards and stables, or the pastures should be supplemented by a daily feed of grain. It is the poorest of all policies to let the sheep begin to go down hill before they come into winter-quarters.

* * *

Where reasonably comfortable quarters are provided for the sheep, it is better to have the lambs dropped before the sheep go to grass in the Spring. If the rams are put with the flocks the first half of November, the lambs should appear mostly in April, and this is none too early.

* * *

The great advantage in having the lambs come while the sheep are in winter-quarters are that they are within the constant supervision of the shepherd, and any assistance needed can be given before it is too late. There is no danger from exposure to cold rains; there is less danger of milk fever; the sheep are much cleaner to handle, and the lambs are more valuable, both to sell as early lambs, or for feeding the next Winter.

* * *

It will pay every farmer, even if breeding thoroughbred Merino sheep, to sort out his second-grade ewes and breed them to some of the black-faced sheep. There is a great and a growing demand for "smut-nosed" lambs for winter feeding. They are now worth a half-dollar per head more than equally good lambs with white faces.

Niagara Co., N. Y. J. S. WOODWARD.

Dairy Husbandry.

THE REFORM OF IRISH DAIRYING.—II.

PROFESSOR J. P. SHELDON.

Dairying the chief industry of the Emerald Isle; favorable conditions; varieties of soil, climate; dairy stock; no improvement in immemorial usage; consequent want of uniformity; recent improvements on larger farms.

THE chief industry in Ireland is dairy farming and butter-making. The pretty euphemism, "Emerald Isle," indicates the prevalence of grass land. The greater part of the soil of the country is derived primarily from the carboniferous limestone, and, so long as there is enough of it, there need be no better soil for the maintenance of permanent pastures and meadows. And when such a soil is covered by a genial atmosphere and a climate which varies less than most others as between Winter and Summer, a climate mellowed and moistened by the Gulf Stream, we have a combination of conditions eminently suitable to stock-raising and butter-making. There is, of course, a great deal of inferior mountain land with a thin soil, of bog land which is of no use for agricultural purposes, and of cold undrained swamps that are of little account in their present condition; but beyond these, there are many extensive tracts of naturally sound land, of others that have been drained and cultivated, and among these are found in places what is admitted to be the finest permanent grass-land in the world. The Winters, as a rule, are so mild that a large number of young stock remain out of-doors all the time, and live well enough on what they find on the land. A friend of mine wintered over 1,400 young cattle in this manner last season, and it will be seen that the Irish climate is in itself, so far as Winter is concerned, an element of great economy, and a source of very considerable gain to the farmers.

Such a country is naturally adapted to dairying, stock-raising and grazing, rather than to the growing of grain. Hence it follows that Ireland is, and is likely to remain, a great dairying country, and the inference is clear that the greatest attention should be paid to the art of butter-making, as well as to that of the breeding of superior cattle. The prevailing cattle are Short-horn in character, though in some of the southern counties a great many Kerries are kept; and the Kerries, the smallest of the British breeds, and little bigger than donkeys, are wonderfully useful little animals, yielding rich milk and plenty of it.

Ireland had a high reputation for butter until the Danes, the Dutch, the Germans and the French went ahead of her in that department. The bulk of Irish butter on the small farms is still made in a primitive fashion, quite out of joint with the progress of the age, and it is difficult not to admit the obvious fact that no improvement has taken place in it perhaps for many centuries. We cannot state with authority the condition Irish butter-making was in, say four or five hundred years ago, but no one would venture to say, in reference to a good deal of it, that any improvement whatever, has taken place in the interval. In thousands of the small farmers' huts, the milk is set to cream in the one general living-room, or perhaps in an adjoining sleeping-room, or in some outhouse miserably ill-adapted to such a purpose. The cows themselves are not uncommonly sheltered under the same roof, or a continuation of it. The dung heap is closely contiguous. The pig, "the gintleman that pays the rint," roams wherever his fancy leads him, and is treated with all the deference to which his position entitles him. The butter is made as best it may be under such conditions, and each successive churning is packed in a firkin till the firkin is full. Where only one cow is kept, the firkin is several months in filling, and will contain many layers which differ a good deal from each other in color and quality. The trying iron brings out a motley succession of samples, and the price is about as we may expect—very low.

This is a state of things which Irish dairy reformers have set themseves to eradicate, and we may hope that ere long it will have become a thing of the past. Much has already been done, and more remains to do. I have spoken hitherto of the small farmers who have one or two or three cows. On the larger farms a great improvement has taken place within my experience. Special dairy rooms, more or less commendable in construction and arrangement, have been provided, and improved equipments are found in many places. Still the system followed is decidedly primitive for the most part, and the questions of temperature, ventilation, situation and the like, are but little understood. Comparatively few dairies produce first-class butter, but these few demonstrate the possibilities of Irish dairying. The price paid for the best butter in Irish markets is two or three hundred per cent. above that paid for the worst, and the people are becoming conscious and tired of that enormous disparity.

WORKING BUTTER BY HAND.—A dairy expert who went out from London to lecture at a dairy test was surprised to find that dairymaids all worked the butter by hand. Instead of using paddles or workers, the "maids" gathered the butter with the bare hands and rolled, slapped and kneaded it as a housewife would work bread. The expert thought this practice would counteract all the advantages due to pretty dairy-maids or superior pasture. He called the system offensive. It would be just as sensible to bring the butter to the table in the hands—without a plate—as to think of eating butter that had been fumbled about for 20 minutes. If they could not give up the old custom, they should at least prepare their hands for it. In Denmark the hands are first dipped into hot water, then into cold and then rinsed in butter-milk before touching the butter.

A HAND-POWER CREAM SEPARATOR was exhibited at the late London Dairy Show. The labor of two men was required to keep it up to the necessary speed. The trouble with cream separators has been that it costs too much to run them. Only the larger dairymen, who could afford steam power, could well handle them. The new implement is said to be not only inexpensive, but so small that it occupies no more space than the average churn. Possibly separators may yet be made on a still smaller scale, so that small dairies may use them.

The Apiarian.

NORTH AMERICAN BEE KEEPERS' SOCIETY.

Bee literature; the way to succeed in bee culture—lessons from a successful apiarist, the "American bee;" superior prepotency of drones; the "ideal" bee.

"APICULTURAL Journalism" was the title of an essay by John Aspinwall, of New York. America is ahead of all other countries in bee-keeping, and has more papers devoted to the subject, but it seems that no bee journal has yet been successful when not connected with the sale of apiarian goods.

Mr. T. G. Newman, Illinois, read a paper upon "Bee Literature." He said that the writers of the Bible tell us of the early races of bees, and describe the "land flowing with milk and honey." The records of the Egyptians and Chinese, cut in stone, show that bees were well known in those olden times. Three hundred years before the Christian era, Aristotle affirmed that the bee was a "magazine of all

the virtues," and Virgil calls it a "ray of divinity." Shakespeare and Milton devoted to it their thoughts and words of praise. Mr. Newman briefly enumerated some of the books on bees; beginning with the "Historie of Bees," published at Oxford, England, in 1609, and coming down to the present day, more than 100 volumes were written.

"Success in Bee Culture" was the title of a paper by C. F. Muth, O. Successful wintering of bees is one of the foremost requirements of the coming crop. Success in this depends upon a strong, healthy colony in the Fall, together with plenty of honey and dry, comfortable quarters. Mr. Muth preferred a large brood-chamber, with a large surface above the brood for the accommodation of surplus arrangements. In the Spring he overhauls his bees, and all colonies are confined to as many combs as each one can well cover. Outside the division-boards he hangs combs of honey, and when the weather is warm the bees will carry the honey over into the brood nest, which answers every purpose as a stimulant for breeding up, and is preferable to the feeding of liquids. The division-boards do not touch the bottom of the hive by about half an inch, which allows the bees to pass under. As the season advances more combs are added. When swarming time arrives, after-swarming can be prevented by cutting out surplus queen cells several days after the issuing of the first swarm. Queens cannot be entirely prevented from entering the upper stories, unless queen-excluding honey boards are used. In raising extracted honey, when the combs of the upper story are filled, they are exchanged for empty ones, and whenever a comb of brood is found, it is placed at the left of the honey-chamber. After the extracting is finished, the hives containing brood in the upper stories are again overhauled, and if the number of brood combs indicates that the queen has been neglecting her work below, the brood nest is looked over, and combs with honey and bee-bread, if any there be, are exchanged for combs with brood from above; otherwise the combs of brood with the adhering bees are used to strengthen weak colonies, make nuclei, or form new colonies. When the combs are again filled, the process is repeated. In closing, Mr. Muth said: "I do not want to winter my bees on sugar sirup, as I fail to see the advantage and the good policy in so doing. It is, of course, uncertain what the next Winter may bring forth, but so far as wintering is concerned with pollen or without it, and with natural stores, I will run a race with any of you who feed sugar sirup. With the above method I believe my bees have gathered as much as the bees of any one of you. The interests of sugar refiners have not been benefited at the expense of bee-keepers. My neighbors do not suspect me of producing honey from sugar sirup, and my labor has not been excessive, but has met all the requirements of my bees.

In the discussion that followed some thought it admirable to spread the brood and add combs, if done at the proper time and under the right conditions. Mr. A. P. Root, O., believes that letting the colony alone would be exactly as well and a great deal easier. He also suggested that a very proper place to test and decide the advisability of spreading the brood would be at an apiary connected with a State agricultural college, which every such college should have and sustain.

"The Bee of America" was a topic brought up by the query: "Has Apis Americana been reached?" It was thought that whether or not the bee of America had been reached, many had attained their ideal bee. Prof. McLain, who has charge of the U. S. Agricultural Experimental Station at Aurora, Illinois, advised that, in breeding, if more attention were paid to the drones employed in the fertilization of the queens, far greater advancement could be made, and also more rapidly; that prepotency is on the side of the drone. After some more discussion upon the subject, Mr. T. G. Newman said that in deciding the merits of an ideal bee, five points are essential and may be enumerated thus: The queen must be prolific, in order to have the hive full of bees at the proper time to gather the harvest of honey when it comes; the bees must be industrious to let nothing escape their vigorous search while gathering the nectar; they must be docile, to allow the apiarist to manipulate them and the hive with pleasure, in order to be profitable; they must be hardy and strong to endure the rapid changes in this very changeable climate, and they must be beautiful in order to secure the admiration of the fanciers of fine stock.

Rural Topics.

CORRESPONDENTS' VIEWS.

VEGETATION IN FLORIDA.—Nothing in Florida surprises the Northern visitor more than the long-continued production of useful products and flowers. Our soil is not rich, but it holds on mightily when once filled with vegetable matter. We began picking our Sea Island cotton in August, and on November 1 it was still blooming. Our Lima Bean patch gave us food for six months. The common snap bean can be made to bear from May to November. The climate and soil of Florida seem to have a mania for making flowers. It seems as though the very fence pickets wanted to bloom. Lantanas and oleanders bloom four months. The roses keep on nearly all the year, and the Cape Jesamine is fragrant and grand from May to Christmas. These are connected with the orange and peach blossoms which are variegated with the daisies. So the seasons pass before us, one endless march of flowers. S. E. WILLING.

Alachua Co., Fla.

WHAT TWO YOUNG MEN HAVE DONE.—There is so much talk in the papers of late about the troubles men have in making a living that I want to tell what two young men here in New Jersey have done. One of them got a piece of woodland within 25 miles of New York. He cut the wood off himself, and the money he got for it will go far towards paying for the land. He has burned and grubbed up stumps and set out trees and fruits, built a little house and barn, and, in fact, made the foundation of a good home. He has done this all alone, while hundreds of other young men were groaning about hard times. The other man is a factory hand. He has taken a little place, bought a small herd of cows and gone to making butter. His wife, a young girl, went right out of the mill into the dairy and spent a month with a good butter maker, learning the business from the very foundation. These young people will succeed and they deserve to. Their work shows grit, and that will count every time. They might have given up at the first hard pull and gone back to the long grind of an existence that thousands drag through. They hung on to it, and the result is that they are going to make their marks. There is a fair chance for every healthy man in this country. The chance is all right; the failure is in the man. H. B. G.

Passaic Co., N. J.

STOVE GOSSIPERS.—I have often noticed with regret the valuable time wasted by farmers around the stove in the village store. In some cases every stove in town has a dozen or more patrons who spend nearly all their spare time hugging it. As a rule, the topics discussed at these gatherings are unprofitable if not altogether damaging. Local gossip often, too often, the worst kind of scandals, form the chief topics of conversation, and many a family feud has originated, and many a reputation has been blasted around the village stove. Such gatherings are frequently obnoxious to the store-keepers, but woe be unto any who venture to break up the charmed circle, for a boycott by the hangers-on means the loss of nearly all the business done in the evening. These gatherings are specially attractive to children, and do them much injury. They hear stories which would never be repeated in the family circle, and find things applauded which would be condemned at home. The best story teller and the most skillful disputant—frequently a man of the lowest and most despicable character—is too often the leader of the crowd, and becomes the pattern for the boys. To be able to tell the biggest story—usually the biggest lie—is all that is required for leadership, or at least popularity, at these gatherings. The damage done by these "stove committees" cannot be counted. J. H. G.

R. N.-Y.—Good. Men who go and talk to a stove, using language that they would be ashamed to use in their families, deserve no mercy. We have frequently seen boys hanging about these gatherings, taking their first lessons in vulgarity and obscenity. Business farmers never haunt such places; they can easily find more profitable work. The croaks about hard times and the bitterness against those who work and succeed are hatched out around these stoves. Keep the boys away from such places, and if you respect yourself, keep yourself away.

Horticultural.

GARDEN NOTES FOR DECEMBER.

W. FALCONER.

THE ORCHARD.—Prune apple trees whenever you feel like doing it. Keep their heads somewhat even, thin, equally spread out and low. Very close pruning induces a growth of switches; you must try to avoid that. Prune standard pear trees almost any time; but don't touch the dwarf trees till towards Spring. Regulate the growth of peaches, plums, and cherries, but scrupulously avoid unnecessary cutting or pruning. Stake securely the weak-stemmed, top-heavy, young trees. In the case of newly-planted stock, some dirt piled up over their roots and around their stems not only protects the roots considerably, but saves the trees a good deal from being racked about by wind-storms.

THE VINEYARD.—Prune the grape-vines. Don't leave a lot of long spur-snags; but cut in close if the eye of the base is a good, plump one. Keep a good supply of sound, stout, firm, short-jointed wood, and do away with long, naked, blind vines. If you want to raise a few more vines by means of layers next Summer, save some fine, young canes now, and shorten them a little. In the Spring all you need do is to elbow them into the earth, and fasten them there by a stamp of the foot or a hooked peg. By Fall they will be well-rooted plants. Or if you want pieces of vines for cuttings or cions, cut them now, and bury them in the earth till towards Spring. If your vines are of somewhat tender sorts, take no risks, but bend them down, and bring the shoots snugly together and cover them over a few inches deep with dirt.

STRAWBERRIES.—Have the patch thoroughly clean from weeds. Mulch among the plants with rich, well rotted manure, and after the ground freezes, say towards the end of November or early in December, strew some light mulching, salt hay or sea thatch, broadcast over the plants and leave it undisturbed till early next Spring. The manure enriches the ground, the thatch preserves the plants from injury by sunshine or searing winds in Winter and also in a great measure prevents their being thrown out of the ground by frost. Many growers do not remove this strawy covering till after the plants have yielded their fruit in Summer.

CURRANT BUSHES.—"Fix" them up now and have no bother with them in Spring when you will otherwise be busy enough. In pruning merely cut out the old, enervated wood, tip the strong, young shoots and remove the little switchy stuff that comes up close about the crown or stem of the plant. Then clean out the patch, slightly fork the ground between the bushes, and apply a heavy mulching of cow manure.

GOOSEBERRY BUSHES.—In pruning preserve the stout arching shoots, keep the bushes somewhat thin and low-headed. Remove the sprouts that arise from about the necks of the plants. Fork the ground lightly and mulch heavily with cow manure. I have had the best success with gooseberries in a cool, deep, loamy soil, in a sheltered, but not sunny exposure, when heavily mulched, and grown as low-headed bushes. When grown as standards, that is on high stems, no matter under what other circumstances, or how much sulphur I used, all the berries mildewed before they ripened.

RASPBERRIES.—As soon as the crop of berries had all been gathered in Summer, all of the old canes should have been cut out and the young ones thinned out to the requisite number for next year's use. But if this has not been done, do so now, and then lay the canes down and cover them with some earth. Of course many varieties are very hardy and survive our Winters without injury; but where their survival is questionable, better lay down the canes and cover them and be safe. When I do not lay down my raspberry canes over Winter, I mulch the ground among them heavily with manure. Tree leaves are also a good mulching in this case.

BLACKBERRIES I treat in about the same way as raspberries, only I seldom mulch them with manure over Winter; I prefer waiting till Spring till I have cut out the multitude of suckers that are sure to come up all around.

CHOU DE BURGHLEY.—This is said to be a cross between a broccoli and a cabbage, and originated with Mr. Gilbert, the Marquis of Exeter's gardener, in Lincolnshire, England, some years ago. The source whence it came gave it impetus. It was vigorously pushed; "everybody" grew it; many welcomed it as a valuable desideratum, and others rejected it as a veritable humbug. At first a great many "rogues" occurred among the seedlings. As soon as it made its debut, I got seeds of it and grew it here, but concluded all my seedlings were "rognes." I then sent directly to Gilbert and got the genuine article. The seedlings grew all right, but they neither hearted nor flowered, and I have grown it every year since then. I have a lot of it now, but have not met with a whit better success. My sowings were made at different times. But the hogs and cows are fond of it, that's some comfort. Have any other RURAL readers succeeded with it?

FRUITS IN NORTHWESTERN WISCONSIN.—Our strawberries here are Wilson, Sharpless and Jersey Queen. We have Cuthbert and two kinds of blackcaps, and the Lucretia Dewberry. All need protection in the Winter. Pear and plum trees were killed down to the snow line two years ago. We have a small, well-flavored pear which does fairly well. Our roses and shrubs all need protection. It takes lots of time and labor, but when I see the plants laden with flowers and fruit, I think it pays pretty well. H. L. J.

Olivet, Wis.

Pomological.

A SIMPLE FRUIT-HOUSE.

As we enjoy plenty of grapes at Christmas, and our method of keeping is new to us, it may be of some interest to readers of the RURAL to know how we have managed to keep unwilted stalks and fresh flavor among the grapes. Last year we converted what was originally a shed into a fruit and ice-house by surrounding it with inch boards battened outside. It was boarded up inside, and a space 10 inches wide between the walls was filled in with dry swamp muck. The shed was divided in the center in the same way (see Fig. 445)

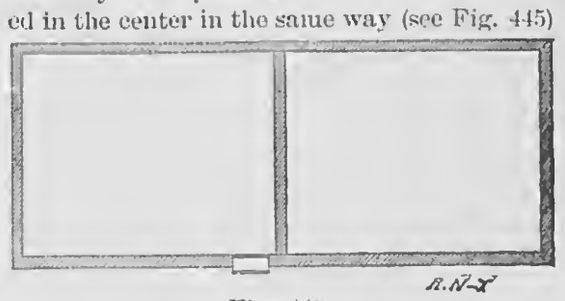

Fig. 445.

and filled in. No doubt sawdust would answer the same purpose where it can be as easily procured. The upper floor of the fruit-house is double and the boards are about three inches apart to allow the partially heated air to return to the ice-house. In doing this it keeps the upper floor cool as it enters on the opposite side from it. Against the division wall and on all sides are nailed half-inch strips so that in the ice-house there will be room for air to circulate through openings eight inches each in the lowest part of the division wall, while the other three sides of the ice-house are filled eight inches around with sawdust. There is a double door with glass front in the outer one to admit light, so that it need not be open to admit heated air.

In this building during the past season we stored asparagus, strawberries and raspberries successfully and are now enjoying grapes that we have often tried vainly to keep in baskets in the house. They were placed in eight-pound flat baskets and hung up to the ceiling, several hundred baskets being in the house at one time, besides those shelved. It is such a simple building as to be within reach of every farmer, and amply repay all the labor and expense. The grapes are not in the least shriveled, nor are they dropping from the stem, which I attribute to the evenness of temperature in the building. Concords are good; Salem and Wilder plump and with succulent stems; Eumelan keeps all its rich flavor; Niagaras as fine as ever, while Duchess were mistaken at the table for hot-house grapes. To those near market it would be quite an item to keep fruit in a building of such simple construction till the flush of fruit is over, and for the family, where there is generally a feast and then a famine of fruit, it is worth trying. The ice melted a little faster at the division wall, but there was ample sufficiency for all our needs, and we are quite satisfied with the success of the experiment.

Prov. of Quebec, Can. ANNIE L. JACK.

The Vineyard.

THE RURAL NEW-YORKER, AND THE WORDEN GRAPE.

I NOTE the following in the RURAL of October 3.

"If any one were to eat first a Worden and then a Concord grape, he could not tell which from the other. As to the time of ripening, there is very little difference. The Worden bunch will not average so large as the Concord bunch. The vine of either is as hardy as the other."

The Worden being undoubtedly a seedling from the Concord, would naturally have many of the characteristics of its parent; but after growing it for a dozen or more years, I must say I find more difference than the above opinion of the RURAL indicates; and if I did not know the Editor to be very careful about such matters, I should be inclined to think he had been comparing a Concord with a Concord; for there is great reason to believe that a good many vines which are growing under the name of Wordens, are Concords, and nothing else. And while I have never been able to see the great superiority of the Worden over the Concord which some persons

have expressed, there are differences which a close observer can detect. To my taste, there is a noticeable difference in character and flavor, not easily described, but still quite distinct. In foliage, the two are very much alike; but the growth of the Worden is generally longer-jointed, and the wood more slender than that of the Concord. The difference in time of ripening, I have found to vary somewhat in different seasons; but the Worden has always been from a week to 10 days earlier. The bunches of the Worden also, under the same conditions, have averaged rather longer than those of the Concord wherever I have seen them growing together. And in some extremely severe Winters when the thermometer has fallen to 30° or more below zero, the Worden has seemed less injured than the Concord.

Although there is to me a difference in flavor, I am not prepared to say that either is better in this respect than the other. Unfortunately, both have the same tender and easily-broken skin, sometimes cracking badly in wet weather, and requiring very careful handling in shipment. Neither retains its flavor and character long after being gathered; nor will they hang long on the vine after being ripe without deteriorating. And, as I view it, the principal, if not the only advantage the Worden has, is found in its earlier ripening, as even a few days are often of importance in northern localities where the Concord is ripened with difficulty. If left upon the vines until a little over-ripe, I think, too, the Worden is more disposed to fall from the stems than the Concord. At the meeting of the American Pomological Society, at Grand Rapids, Michigan, a company of experienced grape-growers, who were invited to visit a vineyard where both varieties were growing in that vicinity, found it very difficult to say to which they would give the preference. I have made some experiments in crossing Delaware and other kinds upon Worden, hoping, through seedlings, to improve the quality with increased earliness, but so far all have proven to be later than either Worden or Concord.

Not long since some correspondent of the RURAL gave me the credit of *originating* the Delaware grape, remarking that this was "honor enough for one man." Permit me to say I think it altogether *too much* honor for any one man to whom it *does not* belong, and I am just that man. The Delaware Grape was first discovered and sent out from this place, and was named "Delaware," I believe, by A. J. Downing for that reason. Who originated it is not known; and the probability is that it is a chance seedling. The only honor to which I was ever entitled was in an early recognition of its merits, and, with others, assisting in its general dissemination.

Delaware, Ohio. GEO. W. CAMPBELL.

Farm Economy.

RECUPERATIVE AGRICULTURE.

CONCLUDING ARTICLE.

PROF. I. P. ROBERTS.

Sorghum as a means of recuperation; character of much farming land; over-production impoverishes both soil and toiler; need of proportionately larger yields on smaller areas; grass! grass! grass! live stock and manure; nature soil-making; essence of true agriculture.

THE day is not far off—it is a disgrace that it is not already here—when we shall produce all the sugar we require from the sorghum plant, which is so admirably adapted to the light lands of the South. It is a little slower to start than corn, requiring a little send-off at first, but finally sending its roots far into the subsoil, defying droughts and bringing up stores of plant food beyond the reach of most other plants and converting them into valuable grain and saccharine matter. During the war sheep were frequently used to blade sorghum. They do the work most thoroughly as far as they can reach standing on their hind legs. If a fair amount of fertilizers be used to start the plant, and the manure produced from feeding the seed and the begasse be returned to the land, it will steadily grow more productive, as has been demonstrated at Rio Grande in New Jersey. Why are we so slow to follow the common practice in England of feeding and folding sheep on grass land to improve its fertility? Why not raise the hardy half-blood Percherons, that relish straw as well as grass, on these poor lands. A little supplemented food will hurt neither the colts nor the field, and the colts will bring from 15 to 20 cents per pound live-weight.

We have still a third class of lands which pay for tilling and give a small profit. Some of them are growing more fertile, or at least more productive to their owners. I have nothing to say at the present time, they have at least partially solved the hard problem, each for himself, yet no two alike save in one thing—all have returned to the land enough plant food, which, added to that carried to the surface by capillarity and long-rooted plants, and that set free by cultivation and brought down by the rains, suffices not only to keep the land up to its normal capacity, but to increase the latter. It is of the land that is slowly and almost imperceptibly decreasing in productive power and fertility that I would speak. This class embraces a vast area, and upon these lands reside nearly or quite one-half of the farming population. "Speed the plow." No, stop the plow and let him that hath been raising 40 acres of wheat write quickly 20, and he that hath been raising 20 let him write 10. We are in some cases carrying the valued, concentrated fertility of the farm in grain, etc., to the railroad, and offering in a glutted market at cost or so slightly above that the profits will not justify the purchase of cheap crude plant food to replace that sold. The result is the farmer replows the tired land and once again against his will, he calls to the land to stand and deliver. If he could only see clearly that 40 acres of wheat, at 20 bushels per acre in New York (or its equivalent) means very small profit, but that 20 acres at 30 bushels per acre means profit and fertility both! Will we never learn that 400,000,000 bushels of wheat bring more money than 500,000,000 bushels? Will we never learn that when any large number of people in this country are working for lower wages than they should or without a liberal profit, most other workers soon share a like fate. Then husband the fertility of the farm till the world is willing to pay cost and profits for what you have to sell. I know the people cry for cheap food, but if some must suffer, then I would quite as soon the suffering should fall on those who squander a large percent of their earnings in pandering to vices as to see it fall on the children and hard-worked, frugal wives of the prairie farmers. About 20 years since the farmers of Iowa were bankrupt with 10 cent corn. I would like to see two-thirds as much raised as now on half of the area of plowed land.

What will be done with this surplus land? "Why, let it go to grass." Why longer fight your best friend? Why not make peace with your friend while you can honorably and profitably? Lay down the implements of warfare, climb on the fence and see the grass grow and the clover perspire with the labor of pumping the nitrogen from the subsoil to the surface. Sign an everlasting peace that your children's children may inherit this land. Corn may be king, but grass sits on the throne and fertility is the power behind the throne. Man cannot live by grass alone, so we must plow; plow, as the world will pay for it; but as we plow we must plan how we can at least partly supply the place of the plants we are destroying. Our domestic animals supply to some extent the office of conserving fertility. Then a reasonable number of them should be kept, and the manure—*all* of it—should find its way back to the field at the earliest possible moment consistent with crops and season.

This will not be sufficient in most cases to keep the land up to its most profitable condition, and just here commercial fertilizers should come in, not to take the place of farm manures, but to supplement them. If we desire to improve the soil, we would do well to study Nature's methods of making soils. We see her clothing the habitable parts of the earth with plants, most of them so diminutive and worthless for cultivation that we hardly notice them, but all are useful as soil builders. Then come the myriad animal forms to feed upon and convert them quickly into soluble food for other plants for other animals. In modern agriculture the same order should be preserved. Raise the grass to feed the animal to make manure to feed the grass. Somewhere before the circle is completed we take a small fraction of toll from the three elements mentioned, and to replace them we draw from the bountiful stores in the bowels of the earth, from the sea and from the waste places.

Then true agriculture consists in taking from the soil such concentrated products as are suited to minister to our varied wants, replacing them with crude, cheap and waste products so skillfully that no serious diminution shall occur. To do this to the best advantage requires a great amount of skill, training, knowledge and labor, and where either or all of these are notably deficient, the land suffers.

Cornell University, Ithaca, N. Y.

GRANARY STEPS

AT Fig. 443 is shown the front elevation of our granary in order to show how the steps can be arranged so as always to have them handy and yet have the granary raised so that mice or rats cannot get into the building. The steps are hung on strong hinges just at the edge of the threshold. A small rope passes from the staple up over a pulley at the top of the door post, and reaches nearly to the floor

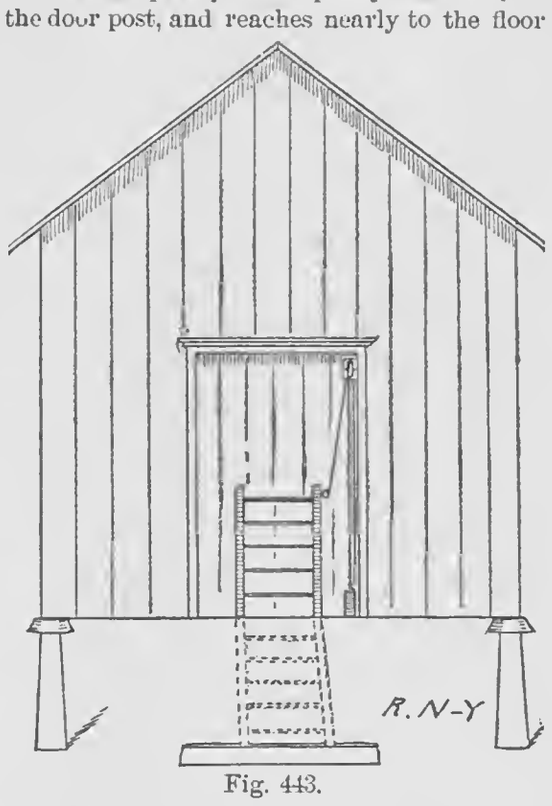

Fig. 443.

with a weight attached; this weight is just heavy enough to balance the steps at any angle. Now to enter the granary open the door; take hold of the steps, a slight pull turns them down; they strike on a block set in the ground which forms the first step. To turn them up it is only necessary to give them a slight start and the weight takes them to their place. If the weight just balances the step, there will be no slamming either way. It is no new thing to have the granary set up on posts, but the trouble has been to have the steps handy. They are generally cumbersome things and the farmer soon gets tired of moving them away and so leaves them after a little while, and the mice and rats get in as bad as ever. Our granary sets on three posts on each side and one in the middle, with inverted tin pans on top of the posts. It has stood 15 years or more without a mouse or rat getting into it, and the steps have never got out of order. When they are down a wagon can be driven alongside so as to be readily loaded.

Grand Isle, Vt. S. M. MACOMBER.

HAY RACK.

MR. A. J. MCDERMID sends us a sketch of the rack shown at Fig. 444. It separates into eight parts, viz.: The bed, two sides, fore standard, two aft stakes, and two bed boards. The bed just fits between the wagon standards, and has cleats to hold it to the hinder ones. It is made of 2x8-inch plank, 14 or 16 feet long,

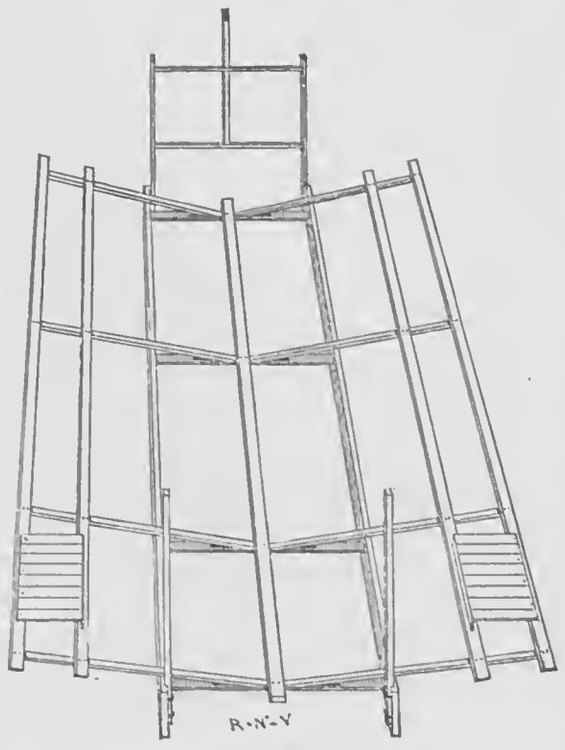

Fig. 444.

with the cross-pieces mortised into it, and has a pair of large staples on the inside of each end to hold the standard and aft stakes. A side is made of two strips, a wheel guard, and four supports, each having a tenon and notch. The center strip is securely fastened to the top of the standard, and has a slit to hold the lines, and the bed boards are fitted around the supports. The bed alone is convenient for hauling barreled apples or potatoes.

WAGON JACK.

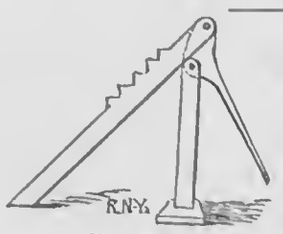

Fig. 448.

THE sketch of the wagon jack, shown at Fig. 448, is sent by Bert Eckerson, of Ulster Co., N. Y. It may be old to our readers, but it is a good one nevertheless. Its structure and the mode of its operation will be readily seen.

FEED HOPPER FOR POULTRY.

IN feeding poultry it is well to keep a supply of some kind of food always within their reach. To throw it on the ground is wasteful and filthy, and an open box or trough is not satisfactory. At Fig. 447 is a sectional view of a cheap and easily-made hopper for this purpose, such as I have in use, and which I am much pleased with. Food kept continually before fowls should be such as they will not gorge themselves with. Dry bran with a little corn meal mixed with it, wheat screenings, or oats, ground or whole, are excellent foods for feeding in this way.

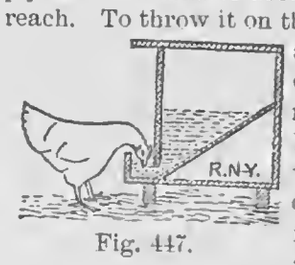

Fig. 447.

Crayson Co., Tex. JAMES NIMON.

DEVICE FOR HANGING HOGS.

HERE is an easy way of hanging dressed hogs at butchering time. Take three poles about nine feet long, and fasten them together at one end with a half-inch bolt, and put a meat hook two feet from the top end on each outside one, as shown at Fig. 446.

Indust'l Societies.

SOCIETY NOTES.

THE AMERICAN PERCHERON HORSE BREEDERS' ASSOCIATION held its annual meeting at Chicago, November 17, with a large attendance. The progress of this Association is said to be unprecedented in the history of any like association. A total of $11,420.72 has been collected in one year. The Association now finds itself $4,248.14 ahead. There are 118 bona fide stockholders. An idea of the interest in the Association, as well as the hopes of the members, may be learned from this extract from the address of Vice-President Kellogg, who said: "Gentlemen, you are engaged in the noble work of planting on American soil what we believe to be the best race of draft horses in the world. The process of selection is continually going on in France, while pride and self-interest induce you to import the best. Let it be our characteristic aim to raise our standard of excellence and seek to give to our country a better race than now exists in France. We extend the hand of friendship to our brothers of the other draft breeds with the hope that they will give to America the best of the European races."

THE TEXAS FAIR ASSOCIATION set apart five acres for the Horticultural Department exhibit. The nurserymen contributed $2,000 worth of ornamental trees and shrubs to permanently adorn the grounds. A very tasty building has been erected. At the late exhibit, this was well filled. Two large tables, each 70 feet long, were covered by the exhibit. Potted plants were massed about the tables. A splendid display of apples was made. Ben Davis led. This is called *the* market apple of the Southwest. Many visitors could not believe that these fine apples were raised in Texas, yet they were—every plate. A dozen plates of the Japanese Persimmon made a fine showing. There was also a good exhibit of pears, peaches and quinces. A State Horticultural Society has been organized with T. V. Munson as president. The display of agricultural machinery at the fair seemed to indicate that Texas must be a great market for this line of goods.

AT the Boulder, Colorado, Fair Short-horns led in the cattle departments. Clydesdale horses were well represented. Berkshire hogs were most prominent. Wyandotte, Plymouth Rock and Langshan poultry were plenty. The exhibit of fruit was very promising.

THE INDIANA HORTICULTURAL SOCIETY holds its 26th annual meeting at Columbus December 7-9. An excellent programme has been prepared, including addresses by Prof. Burrell, Prof. Troop, Dr. Fumers and others.

THE ILLINOIS HORTICULTURAL SOCIETY meets this year at Jacksonville, December 14-16. The programme will be sure to interest those who attend. Liberal premiums are offered.

PRAISE is heard on all sides for the managers of the Wisconsin Farmers' Institutes. Many of the best agricultural speakers have been engaged. No political battle could have been more carefully mapped out than this campaign. It will prove one of the most profitable campaigns ever held in Wisconsin. The state is making real progress in agriculture. We believe that the Wisconsin Experiment Station returns better results to the farmers of the State for the money expended,

than any other station in the country. This is chiefly because the reports are simple and timely and deal with matters of practical interest.

What Others Say.

EGG TRADE AND INDUSTRY IN RUSSIA.—The egg trade and industries have attained large proportions in Russia. In 1873 there were exported from Russia 30,000,000 eggs, valued at $157,000, or 52 cents per 100 eggs, and in 1884 228,000,000 eggs, at $1,525,000, or 67 cents per 100. In 1883 Russia exported 64,000,000 eggs to Germany, 46,000,000 eggs to Austria, and 16,000,000 to England. The latter country imports annually about 700,000,000 eggs, paying from 6s. to 12s. per 10 dozen. For a long time the Tartars of Kazan have manufactured egg soap from yelk of eggs. In 1850 Mr. Balabin began to manufacture albumen out of the white of eggs and egg oil from the yelk of eggs. Later he also made egg soap and egg pomatum. Egg oil is used for oiling kid leather and wool in the wool mills. In 1879 in Russia there were produced 75,000 pounds of egg albumen, valued at $37,000. Now there are in Russia five factories making egg albumen and as many more manufacturing blood albumen. Russian manufacturers export their egg albumen in dry condition (in barrels) to France and Germany, charging from $20 to $22.50 per pood (36 pounds). Blood albumen is selling at $7 per pood. Yelk is also preserved in the form of a powder, which is much used in bakeries and confectories. It is selling in Moscow at from $4 to $8 per pood. Being dissolved in glycerine and salicilic and and some other acids, yelk is preserved in fluid shape, and is used in tanneries. In Russia over 12,000,000 eggs are used annually for manufacturing purposes, valued at about $65,000.

NEW SUGAR-MAKING PROCESS.—Of late Louisiana papers have said that the sugar industry there was declining owing to improved processes employed elsewhere, with which planters could not compete. The new process of sugar-making briefly referred to in our "Agricultural News" last week, as shown by experiments at Fort Scott, Kan., by Professor Wiley, of the Agricultural Bureau, points to the more profitable making of cane and even sorghum. The extraction of the sweet from cane or sorghum or beets has been by squeezing under pressure. The new way is called the diffusion process, and consists in soaking out the saccharine matter. The average yield of juice by the pressure process is from 56 to 61 per cent. of the whole. By the best appliances from 70 to 80 per cent. has been obtained. By the diffusion process it is claimed that from 90 to 95 per cent. of all the juice can be extracted, and that in a much better condition. Mr. R. Sieg, "a Louisiana expert in sugar manufacture," reports that by the old practice sorghum yielded 47½ pounds of sugar per ton. By the new process 80 to 90 pounds are expected to be obtained. It is reported that at the New Jersey factory the yield is even better than this. But a less yield than 80 pounds per ton will make sorghum a profitable crop commercially. A telegram sent by Professor Wiley to the Commissioner gave as the first results of the process a yield of more than 120 pounds of sugar to the ton of cane, whereas by the crushing process in use in Louisiana, the yield would have been but 80 pounds. A later dispatch reports a yield of 134 pounds per ton.

CROP MORTGAGES.—The custom of mortgaging ungrown crops is so common and productive of so much evil in some portions of the South that, according to the St. Louis Republican, there is "more or less clamor for legislation to regulate or prohibit the practice." It is added that in Arkansas many members of the new legislature "were elected under pledges to work for a repeal of the law permitting such mortgages." Farmers who have rented land, or whose land is encumbered, give these crop-mortgages as security for supplies which they must have. It is a common thing for them to use this credit to the extreme limit that the storekeeper will allow. When the crop is harvested, its entire proceeds often fall a little short of paying the mortgage, and the farmer is "not only again without money or credit, but is actually in debt and under obligations to the storekeeper who has accommodated him." Such a system, of course, means high interest and high prices for everything the farmer buys. It is very doubtful if a law prohibiting these mortgages would afford much relief.

PURIFICATION OF WATER.—Professors Austen and Wilbur, of Rutgers College, have been conducting a series of experiments on the purification of water by means of alum. The method was simple enough. A small amount of alum—3¾ grains to the gallon of water—was added, the whole shaken and then allowed to stand for a short time. Polluted water was formed by adding sewage to perfectly pure water, analysing, precipitating with alum and then analysing again. It was proved that many waters which are positively unfit to drink would be rendered fit to drink by treatment with alum. The action of the alum was immediate. This was proved by the fact that when it was added to water already purified by its use no precipitate would form. This use of alum is old. The muddy, impure waters of many of the western streams can be rendered fairly palatable by its use.

THE ISLAND OF BARBADOES with 166 square miles supports a population of 175,000 or 1,054 persons to the square mile. This was thought to be the most densely inhabited portion of the earth's surface, but it is now found that the island of Malta, with 95 square miles of surface, contains 142,500 inhabitants, or 1,500 to the square mile. With this ratio the New England States could hold a population of 102,522,000, or the State of New York 70,500,000.

BRIEFS.

PROF. SHELTON AND MR. DARWIN are not exactly of the same mind as regards bumble-bees and clover. In Kansas, bumble-bees are almost unknown. It is safe to say that not one clover head in a dozen ever knows the embrace of the bumble-bees, and yet nowhere are such crops of clover seed grown as in that State. Every clover head which is allowed to come to maturity is every year filled with seed of best quality. Certainly the clover worries along very handsomely without bumble bees.

COL. WELD says in the Guernsey Breeder that when cream is thoroughly ripened, free from lumps, perhaps strained, and every way just right, the churning should be started at a temperature of 62°—the point usually marked for churning on dairy thermometers. Then the butter comes quickly, and it usually all comes.....

DR. HOSKINS thinks that it would be a good thing, sometimes, if the butter expert could be tested as well as the butter. The result might possibly raise a laugh. In regard to the grain, every good dairyman knows that it can be as thoroughly (though not so easily) preserved by the old method as by the new.....

THE Dr. says that there is really no true "grain" to butter, pure butter being homogeneous in its texture. What is called the "grain" is a granular appearance resulting from a general and equal distribution of briny water, separating the little pellets of butter that first appear in churning. "Only this and nothing more," and our grandmothers (some of them) knew how to preserve that before either Professor Arnold or the "granular method" was thought of.....

THE American Dairyman says that if we let a drop of fresh milk fall into a glass of pure water, and the milk promptly disseminates itself through the water, the cow that yielded that milk is not with calf, but if it sinks to the bottom she is.....

A WRITER in the N. E. Homestead has in a number of cases tried feeding apples to milch cows with the invariable effect of lessening the flow of milk.. .. ..

OUR English correspondent and dairy authority says that all churns should be provided with a small pane of glass, so that the churner may see without opening the churn when the butter begins to form.....

THE New England Farmer suggests that Winter is the time for harvesting ideas.....

IT also suggests that we give our boys the money and let them subscribe and have papers sent in their own names. They will read them with more interest while they do the parents just as much good... ... .

THE Husbandman was one of the farm journals that rejected the advertisement "Enormous fortunes awaiting claimants in England, France, Germany and other countries." The editor remarks that the advertisement has appeared in a large number of papers received in exchange, and it is reasonable to assume that in each instance the publisher knew that by its publication he aided a swindling scheme. The man who plans a swindling scheme is no worse than the man who aids him to put it into successful execution, yet that is the part accepted by publishers who take deceptive or dishonest advertising..... .....

MR. DUN, the noted New York Mercantile Agency proprietor, says that firm has over one million of business men reported to it every year—that is one store to every 50 persons. Our esteemed contemporary, the Rural World, commenting upon the above, advises those who would study their own interests to stick to the farm. ....

PROF. SANBORN (Missouri) hopes to induce the different thoroughbred cattle associations to select 10 representative steers from each breed and place them in his charge on the State college farm, where they are to be fed under the same conditions of course. In this way he aims to determine the merits of the different breeds. It is a good way to fight out the "battle of the breeds"... .....

TAKE two colts, says a writer in the Rural World, as nearly alike as can be found, and put them in the same pasture; feed one oats and the other corn and you can see the difference in a month. In a year you never would know they had looked alike. .....

MR. CROSBY, in the Cultivator, says that he thinks Orchard Grass the most over-praised of any grass grown in the country. Even if cut and well cured while in blossom, the hay, he says, is not liked by either horses or cows. He has never seen it yield a good crop of hay in weight, although to look at a field of it about the time it is ready to cut, one would suppose the yield would be heavy. It has been the RURAL'S duty to chronicle the gist of what has been said of Orchard Grass—but we have been careful to state our own experience, viz., that it is far less valued at the Rural Farm and by our neighbors than Timothy....

WE have also stated that Orchard Grass, no matter how thickly the seeds were sown, would nevertheless grow in bunches or "tussocks..... ....

THAT well-known pomologist and good man, J. J. Thomas, speaks of the Clairgeau Pear in a recent number of the Cultivator and Country Gentleman. When a tree of the Clairgeau is loaded with large, ripening, crimson-cheeked pears, it excels any other sort for its showy appearance, and the fruit in market retains this superiority. Its freedom from blight adds to the value of this variety. On young trees, the quality is often quite poor, and when the pears rot before softening they are perfectly worthless. As the trees are older the quality improves, and the larger specimens become melting and delicious.....

THE Sheldon and Clairgeau are variable kinds of pears, but when in perfection they are hard to rival.....

NO man, say Dr. Hoskins in Vick's Magazine, can graft a Rhode Island Greening on a sweet apple stock and another from the same on a sour stock, and have the same fruit in appearance and taste as the original from each tree. At least he has never been able to do it. He has a number of them, but no two are alike..... .. ..

WALDO F. BROWN says in the Farmers' Review that there are thousands of good cows owned by men who do not know it. They never feed high and have not tested the milk, and they do not care for a cow in a way to make her do her best. A neighbor of his sold for $35 a cow that in the hands of her new owner has since made 53 pounds of butter in a month—an average of over 12 pounds a week.

PUBLIC slaughtering at Fat Stock Shows is justly and forcibly condemned by the Farmers' Review. Feeling people can not of choice witness the death agony of an animal at the hands of a butcher, nor do we admire those who have a morbid love for such spectacles. At the Kansas City Fat Stock Show the editor noticed with astonishment ladies looking on without apparent feeling while animals were being knocked down, bled and opened. Worse than that, they had their children, some of them little girls, with them, and were using every endeavor to give them a good show of the miserable scene. A poor start in life truly for the sympathetic feeling and tender emotions generally attributed to modest womanhood.... .. ..

PUCK says the leaders of the Knights of Labor are driving their dupes into a series of strikes that will ultimately beggar the whole organization. When all Labor is on a strike and earning nothing, how is Labor to be fed? And how are Labor's children and wives to be fed?.....

ONE of the many silly things advocated by verdant farm editors is the use of tile drains for blanching celery.....

C. A. GREEN says in the Tribune that there appears to be in every human breast a natural desire for rural life, the glare and glitter of the city soon becoming tiresome.....

MANY of the young sows that carry off the first prizes at the fairs never rear any progeny, says Our Country Home. They have been overfed. In some cases they stop growing entirely, so that, in addition to being worthless as breeders, they become comparatively valueless for meat . ...

MR. E. H. LIBBY says that war for principle has been declared, and the farmers *shall* yet be represented in our government by farmers ....

MR. F. D. COBURN, in our Country Home, gives this experiment in feeding pigs, which was made in Ohio Co., West Virginia: In the Winter of 1882-3 he fed 22 young hogs, and having little corn concluded to try bran, though assured by several that it would be a failure. He bought a ton of bran, paying $26, and began feeding it Dec. 23. He made it into a slop, a barrel at a time; had a large barrel sunk into the ground beside the pump. He fed six bucketfuls twice a day, and the ton lasted 60 days. In addition to the bran he fed them one bucketful of nubbins twice a day. He weighed them Dec. 23, and they weighed 1,550 pounds. Weighed them again Feb. 21, and they weighed 2,383 pounds, a gain of 833 pounds; average gain nearly 38 pounds. He considers the above a very favorable showing for bran in slop. Bran is much cheaper now.....

Everywhere.

RURAL SPECIAL REPORTS.

Michigan.

SCHOOLCRAFT Co., Nov. 16.—The hay crop was very good on clay land, but the reverse on the sandy farms near the shore of Lake Michigan. Potatoes a fine crop; also wheat and barley. Oats rather light, owing to the dry weather of June and July. T. P.

New York.

WESTFIELD, Chautauqua Co., Nov. 6.—Crops fair. Corn and potatoes two-thirds of a crop; oats the same; apples, half a crop; grapes, an extra crop. We have not had a frost here this Fall to do any harm till last night, when six inches of snow fell. S. E. W.

North Carolina.

HENDERSON, Vance Co., Nov. 5.—There was a little frost in spots about a month ago, which did some damage to tobacco; but as yet we have had no killing frost here. Tobacco suckers, tomato plants, etc., are as fresh as in Summer. M. B. P.

Wisconsin.

FREEDOM, Outagamie Co., Nov. 15.—Weather warm and pleasant for time of year. Farmers are still plowing. Weather dry and roads good. The season has been dry, and crops light; still farmers have raised enough to live on, and to feed their stock. Prices of most kinds of produce are low, making it hard times for those who have debts and interest to pay. Strawberries and raspberries were fair crops. Apples do. The Wealthy grows in favor as a hardy tree, a good keeper and a good apple, and a free and early bearer. Grapes did well with us this year. I think they like a dry season. E. N.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

CABBAGE AND "ROUGHNESS" AS STOCK FEED, ETC.

W. W. F., *Waterville, Ohio.*—I have eight acres of late cabbage, of which many heads have burst open and grown again. There are also many soft and miniature heads, and, of course, a very large amount of surplus leaves, etc., making a very large quantity of stock food. Now the question is, how can I best utilize this food? Can I buy a flock of sheep, and in any way use this as a part of their food to a profit, and if so, how? 2. A neighbor says his sheep one Winter run to a straw stack and in a cabbage field, and came to Spring very fat, but that the lambs did not do well; was it on account of being too fat, or because the cabbage was unwholesome? 3. Could I stack the cabbage in alternate layers with the straw, or would it be better to construct a cheap silo, and if so, how shall I do it?

ANS.—This cabbage is a very valuable food in connection with the straw, both wheat and oat, and it would be better still if a little grain be fed daily. We certainly could buy sheep and use this as a part of their food at a profit; but whether our friend can do so depends upon many circumstances, among which is the question as to what kind of quarters he has, the price at which he can buy sheep, and very much upon the care he would give them. Any stock when fed any considerable quantity of green food, should be warmly housed, but when so quartered they will make a good return for such food. 2. Neither was the cause. Where sheep have plenty of grain food, it is

impossible to have them too fat for lamb raising, and the fatter they are the better the lambs will do; so on the other hand, if warmly housed, all the green food they will eat is none too much. What the cause of unthrift in the lambs was cannot be told with so little knowledge of the conditions. 3. The whole problem in utilizing such waste products lies in how best to preserve them. To stack the cabbage with straw does not prevent the frost from breaking up its tissue and ruining its feeding value, and, besides, when frozen solid it is not suitable food for any stock, much less for pregnant ewes. It can be ensilaged; but then it is doubtful if it would pay to build a silo, however cheap, for the preservation of a single crop. We have often tried to grow cabbage for sheep food; in fact, we have now several thousand heads for which we have no profitable market, and we have always found it very difficult to keep it in good order much beyond the middle of January. The best way we have ever tried is to place it very thickly, heads up, in a sheltered spot near the barn, and on this place a second, third, and even fourth layer, letting the stalks of each layer pass down between the heads of the next one beneath; the top layer we reverse, letting the stalks stick up. Over the whole we throw a foot of dry straw, and over this another foot of wet straw, swale hay, or even corn-stalks. This excludes nearly all frost, and by commencing at one side it can be easily taken out, and in very severe weather we remove to the barn one day's ration in advance, and here it becomes thawed and in good feeding condition. The sheep will eat it, stalks and all, except the very roots.

SEEDING FOR A PERMANENT PASTURE.

E. L. H., Downsville, N. Y.—I have a piece of newly cleared, dry, hill land, which I wish to convert into a permanent pasture. The timber was beech, birch, maple, basswood, ash, etc., which was mostly burned on the ground. There was much old, rotted hemlock on it. It is sowed to rye; now, what grasses and how much of each shall I sow for a permanent pasture, and when shall I sow it?

ANS.—In seeding for a permanent pasture two things should be fully provided for. The land should be filled with plants and the mixture should contain varieties that bloom and mature at different times, so that the stock can always "get a fresh bite." Where a single kind of grass is sown, or only two or three together, as is the general custom, very many vacant spaces occur and these furnish no feed. If we examine an old pasture, we shall find, no doubt, from a dozen to 20 varieties of grasses on a single square foot, and each growing as vigorously and furnishing as much feed as though growing alone, and were we to remove all these except one, it would never fill the space and would furnish very little if any more feed than it now does. As a rule, seed enough is sown, but it does not contain a sufficient number of varieties. Most people in stocking down use one peck of Timothy seed containing over 13,000,000 seeds, and 10 pounds of clover containing 2,500,000 seeds. This gives over 360 seeds to the square foot, but for some reasons these grasses will not grow so thickly, and soon a sufficient number perish so as to leave many bare spots, and these detract very much from the value of the pasture. If people used the same quantity of seed, but made it up of half-a-dozen varieties of grasses, they would not only cover the ground better, but would have grasses maturing at different periods and much more palatable to the stock. The growth of timber would indicate that the land is good and strong, and we should advise the using of the following mixture: Timothy, four pounds; Kentucky Blue Grass (June Grass), seven pounds; Orchard Grass, four pounds; Red Top, four pounds; Perennial Rye Grass, four pounds; Mammoth Red Clover six, and White Clover four pounds. This is somewhat more seed than is usually sown, but is none too much. Sow the Timothy, Red Top and Blue Grass seeds at once and the balance early in the Spring, and then don't pasture much next season, and not at all till after the full rains have given the grass a good start.

SWINE PLAGUE.

W. J. G., Knowlton, N. J.—Like the farmers hereabout I have lost several hogs by a disease the symptoms of which varies in different localities—but the outcome is always death. My hogs were first attacked with profuse bleeding at the nose, distress in the head, indicated by their butting against objects, followed by paralysis of the hind-quarters, either spine or legs, extreme prostration, refusal to eat, and high fever. After several days the skin turned very red, finally becoming a deep purple, with blotches of still deeper color. The animals uttered frequent sharp squeals as though in great pain; they acted erratically, turning half somersaults, etc. Death soon followed. The losses in this section have been very heavy, and no amount of isolation, change of quarters, fumigation or medicine has given the slightest protection or relief. What is the trouble?

ANSWERED BY F. L. KILBORN.

Some of the symptoms certainly point to swine plague—"hog cholera"—as the disease affecting your animals; while the other symptoms are rather equivocal. But in different outbreaks of this disease the symptoms are often so varied that we are beginning to believe that almost any symptom may be, and occasionally is, a concomitant of this disease. In fact it may be said that there are really no satisfactory diagnostic symptoms that are at all constant. The one character by which the disease can most satisfactorily be distinguished, and which is more constant than any other (and even this is not constant, although nearly so) is the post-mortem lesions found in the cœcum and upper colon of the large intestines. Here on the mucous surface there will almost invariably be found, either deep congestion or ulceration, or both, especially about the ilio-cœcal valve, where the small intestine joins the large. Two or three post-mortems at the most would always be sufficient to recognize the disease, while one is usually sufficient. It would be well to examine the interior of the large intestines, especially the cœcum or blind pouch, and about the ilio-cœcum valve, and if ulceration is found, or in recent acute cases only deep reddening of the mucous membrane, the disease is swine-plague. Treatment of the sick animals is very unsatisfactory, as well as unprofitable, except perhaps in the case of very valuable breeding stock. They remain so long unthrifty, usually from several months to a year or more, that it is better to kill all diseased animals at once, and direct the attention to preventive measures to check the further spreading of the disease? Separate the healthy from the sick, and remove them at least several rods away to windward, if possible. Feed twice daily in the food of each animal one year old and older, 20 drops of sulphuric acid and one-half dram of sulphate of iron. Pigs three months old may receive one-eighth, and those six months old, one-fourth of this amount. If treatment of the sick animals is desirable, they may receive the same dose. Watch the healthy animals daily, and remove any showing the first signs of illness. Any pen not yet infected, and all new arrivals should be very carefully guarded, so that dogs, rats, fowls, or other small animals cannot pass from the sick to the healthy. If possible, have a special attendant to care for the healthy animals; otherwise always care for the healthy first and the sick last, and then do not go near the healthy again until necessary to feed. Give special attention to the hygienic surroundings of the animals: the pen should be clean and comfortable; the food wholesome. It is better not to allow the animals the run of a yard, because of the difficulty of disinfecting it. All dead animals and their products should be deeply buried or burned. Disinfect all infected pens, as well as everything else with which the sick animals have come in contact, with a two-per-cent. solution of sulphuric acid, one-half pint of the strong acid to each three gallons of water. If, on examination of the dead animals, the above lesions are not found, write to us again, telling what lesions are found.

A GOOD WIND-MILL; SHEARING WETHERS FOR WINTER FEEDING.

W. T. T., Salisbury, N. C.—1. What wind-mill is the best for pumping water for stock from a well 70 feet deep? 2. I am fattening sheep for spring market, and expect to keep them in warm stables; when would it be best to shear them?

ANSWERED BY J. S. WOODWARD.

1. I have never used all the styles of wind-mills, and would not like to say which is best; in fact, I could not tell if I would. I have had an iron turbine made by Mast, Foos & Co., in use now some 10 years, and it works perfectly—costing nothing beyond the little oil needed. It pumps from an 82-foot well into a tank standing 18 feet from the ground all the water needed for 800 sheep, 60 cows, 12 horses, 60 hogs and for two houses, and could pump twice as much easily if needed. 2. If the sheep being fed are mature wethers, and are to be sold before April, I would not advise shearing for the reason that without the wool the sheep could not be moved safely in all kinds of weather. I would apply the crude petroleum and salt fat mixture to kill the ticks. The stables should be fully ventilated and kept at about 50 degrees Fahrenheit. If I sheared any it would be only a few by way of experiment, watching them very carefully. I have never tried shearing wethers for winter feeding, as I do not use any such; but I would really like to have some one who does feed them try the experiment. If the sheep Mr. T. has are lambs or breeding ewes they should be shorn some time in December. I shall commence to shear mine, beginning on the lambs, the first week in December, intending to get through before New Year's. After shearing, the stables should be kept at from 55 to 60 degrees Fahrenheit and well ventilated; but all currents of cold air must be prevented from blowing upon the sheep. One of the most important points to be looked after with winter-shorn sheep is a full supply of fresh air without currents.

IMPORTING SHEEP FROM ENGLAND.

E. J. G., Clifton, N. Y.—1. What is the probable cost of importing 10 Hampshire Down ewes? What is the best time to bring them over? Could they be transported from the mild English to the severe American Winter if blanketed on reaching our shores?

ANS.—The cost of importing sheep from England will vary considerably as the importer may be experienced or otherwise. If a person comes out with the sheep, there will be his passage, about $30 at least, and the freight on the sheep, which will not be less than $10 per head. In addition there will be the expense of feeding the sheep, which will be but small. By taking the right means to have the sheep certified by the American Consul in England as imported for breeding purposes, for which a small fee is paid, there will be no import duty. The whole cost of importing the 10 sheep will no doubt come up to $150, unless some specially favorable circumstances can be made available. There are various risks to be met in importing sheep, from the buying of them to the getting of them home; in the acclimatizing of them and in getting inferior animals unless high prices are paid, so that as there are excellent Hampshires to be procured without the cost and risk of importing them, it would be far wiser to procure them here. Mr. James Wood of Braewold, Mount Kisco, Westchester Co., N. Y., has the best flock in America, of these sheep.

Miscellaneous.

E. D. H., Miller's Corners, N. Y.—What is the best feed for fattening lambs? I have corn, clover hay and small potatoes; would it be absolutely necessary to get anything else? They are May lambs and not very large; how much feed each would they require? Would wheat bran be a good feed?

ANS.—Spring lambs should have been put under feeding two months ago. "An animal well summered is half wintered" and lambs which have been fed since the pasture began to fall off should now be large and in good condition and half fattened. It is a question now if it would not be better to make wethers of the male lambs and feed them so as to keep them growing fairly well and turn them off from good pasture next year. If it is desired for some good purpose, to fatten them as well as they can be now, they should be given all the hay they will eat three times a day, and corn and bran morning and evening; half a pint per head at each meal will be sufficient. Potatoes are not of much use in fattening sheep: good clover hay free from mold, sound corn, coarsely chopped, and bran are all that are required. Fresh, pure water from a well should not be forgotten, and a little salt twice a week. A clean, dry yard and a cover from storms are necessary.

E. B., Webb's Mills, N. Y.—Where can I get a whiffletree neck-yoke, and is it a practical device for plowing in an orchard.

ANS.—We suppose you mean an arrangement for plowing young orchards, which does away with the use of whiffletrees and the danger of injury to the trees by their use. If so, we know of nothing so good as the Sherwood harness, made by Sherwood Harness Co., of Syracuse, N. Y. It is made of steel and is suspended under the horses, near their forelegs. It is light, strong, durable and very handy even for plowing, and there is no possibility of "barking" the youngest trees by its use. We have used a similar device and cannot see how we could get along without it.

W. E. B., Wichita, Kan.—Will lime, plaster-of-Paris and salt hasten the growth of cabbages and increase their size?

ANS.—In certain soils, either lime or salt *may* have the effect to liberate plant food not otherwise immediately available. Without entering upon further particulars, we should reply "No" to the above inquiry.

L. W., Grimsby, Ont., Can.—Ardisia crenulata can be bought of Peter Henderson, New York, or John Saul, Washington, D. C.

"The Model Newspaper of New England."
—Boston Commonwealth.

SPRINGFIELD REPUBLICAN
FOR 1887.

The REPUBLICAN aims to be a newspaper in the broadest and highest sense. It prints all the legitimate news of the day without fear or favor, unembarrassed by personal or partisan obligations, and in compact, well arranged form. Its facilities for gathering and publishing the news are unsurpassed outside of the largest cities, and are constantly improving.

THE REPUBLICAN is distinctively a New England newspaper, although its reputation is national. It faithfully reports the life of this region and represents its intelligent spirit.

In its political attitude THE REPUBLICAN maintains a thorough independence, giving a fair hearing to all reasonable men and parties in its columns, but asserting its own convictions on public issues with vigor and clearness. It is opposed to unjust monopoly in every form, to oppressive and unnecessary taxation, to any misuse of public trusts. It favors tariff reform in the interest especially of the poor man, civil service reform in the broadest measure, suspension of silver coinage and the acceptance of the commercial world's money standard, and the promotion of American interests by natural and sound methods.

THE REPUBLICAN is an earnest advocate of temperance, of social simplicity and purity, and of all the good causes that help to make life better.

It is not merely a journal of news, but undertakes to instruct and entertain its readers by the publication of a rich variety of literary and miscellaneous matter, embracing home and foreign correspondence, stories, poetry, book reviews and notices, religious selections and discussions, special articles and compilations for the farmer and mechanic, for women and children, dramatic, art and society notes etc.

A new and valuable feature of THE REPUBLICAN is its

SERIES OF WAR MEMORIES,

Being interesting reminiscences of the rebellion written expressly for its columns, chiefly by Western Massachusetts veterans, both officers and privates. These articles appear in Monday's Daily and in THE WEEKLY REPUBLICAN each week.

THE DAILY REPUBLICAN

Is $8 a year, $2 a quarter, 70 cents a month, 18 cents a week, 3 cents a copy.

THE SUNDAY REPUBLICAN

Is $2 a year, 50 cents a quarter, 5 cents a copy.

THE WEEKLY REPUBLICAN

AND THE

RURAL NEW-YORKER,

ONE YEAR for $2.50.

ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, DECEMBER 4, 1886.

ANNOUNCEMENT.

OUR readers will be pleased to know that Joseph Harris of Moreton Farm, near Rochester, N. Y., has written a series of articles for the RURAL NEW-YORKER to begin with and to continue through 1887. The subject is

"THE EXPERIMENTS OF LAWES & GILBERT OF ROTHAMSTED, ENGLAND.

We do not believe a more important and instructive series of articles has ever been offered to the farmers of our country. Sir J. B. Lawes has done more than all other experimenters put together to solve the great problems of soil food, soil exhaustion, the action of manure and chemical fertilizers in the soil and their effects upon plants. This work of 44 years will be reviewed by Mr. Harris, who is specially fitted for the task, in that he was himself a student of Dr. Lawes, at Rothamsted, and has since been in regular correspondence with him and received and studied his various publications issued meanwhile. And there is no more fitting medium for the presentation of this series of articles than the columns of the RURAL NEW-YORKER which was the first American journal he ever wrote for.

THE last number of the R. N.-Y. for 1886 will be No. 1926. The present number (see first page, under the bull's head) is 1923. All subscriptions numbered 1926 (see address labels) as well as those not having *any* number, expire with this year.

WE are of the opinion that celery would keep much better if the protecting material over the trenches were not permitted to come in contact with the leaves—that is, an air-space should be provided *over* the leaves. This we have done by placing over the trench two hemlock boards nailed together forming a V, and the protecting material is placed over this as needed.

IT is very hard for farmers to see evils to which they are subjected without being able to see any way of avoiding them. The dressed beef business at Chicago is one of these evils. So colossal has this business become that the mere absence of one of the large packers, or their representatives any day from market has a depressing influence on prices. Stock owners are utterly powerless to alter the situation here. The movement to establish a rival enterprise at St. Louis is commendable as affording a chance for competition; but past experience is not encouraging with regard to its success. There must be a way out of this and other troubles; in what direction does it lie?

WHAT is to be expected from the RURAL'S rye-wheat hybrids? If we mix rye and wheat flour, the bread made from the mixture is of better quality than that made from pure rye and of poorer quality than that made from pure wheat. But Nature doesn't mix things as we do, and it is within the possibilities that the rye-wheat flour may prove to be better than either, or poorer than either. All that at present appears is that some of these hybrids bear larger leaves and culms, and larger heads than any wheat varieties which we have raised or have known to be raised in this climate.

IF the telegraphic accounts from Chicago can be relied upon, the late disastrous eight-hour strikes in the packing-houses there, were caused by fellows who sought to use the strikers for political purposes, and in violation of written contracts. The strike was not desired by the men—they merely went out like a drove of sheep blindly following the foremost wether, often the silliest animal in the flock. The resulting distress and misery to the families of the strikers and the heavy losses to the public should be a caution against such ill considered movements in future. A fellow named Butler appears to be the Martin Irons in this case. The fate of the other Martin Irons should be his.

WE object to cheap candy. The stuff is filthy and impure and unfit to enter the human stomach. It is made, and kept in nasty places, out of cheap materials, some of which are positively harmful. There is no excuse for its use. Christmas trees, church fairs and entertainments will be crowded with cheap candy this month, and those who provide it will hold cheapness as a prime consideration. Why not have less candy and have it better? There is more difference between pure candy and the cheap stuff found in the village stores, than there is between pure butter and oleomargarine. Farmers who believe in the unhealthfulness of bogus butter should be the last to provide cheap candy for their children.

THE public debt of the Dominion is $250,000,000 or $55.50 per capita; and the receipts of the past year have fallen $6,000,000 short or the estimates. This enormous debt was incurred mainly as an investment for the purpose of building public works which, it was supposed, would pay a reasonable interest and contribute a sinking fund which would eventually extinguish the debt. This expectation has not been fulfilled, and most Canadians now acknowledge that in this respect, Sir John Macdonald's financial policy has been a risky one. The coming elections will show the public estimate of it. The discontent in the Maritime Provinces indicates that there at least it is not popular; but, then, the Maritime Provinces have gained little from the public works on account of which the debt was incurred.

WE have often read of manure that caused a great growth of tops, but few potatoes. We once by mistake spread a large quantity of unleached ashes on a field at the Rural Farm. Their tops, from their fine heavy growth, promised a yield of at least 300 bushels to the acre, but the crop amounted to about 175 bushels. The garden soil at the Rural Grounds has received very large quantities of all sorts of chemical fertilizers, but not very much farm manure. As is well known to our readers, we never fail to raise immense crops of potatoes in this soil, though potatoes have been grown successively for many years. We are never fearful when we see the fine growth of vines that the growth of tubers will not be proportionately large. In fact, it has seemed to us that it is practically impossible to make land too rich for potatoes. Why the application of wood ashes should have given at the Rural Farm splendid vines and a small yield we have never been able to account for. If nitrogen alone had been abundantly applied, we might have anticipated something of the kind. But wood ashes give only potash and phosphoric acid.

IN localities where sugar maples thrive farmers have a great advantage in the fact that profitable winter and early spring work is provided. The product of the sugar bush will often far more than compensate for accidents to crops. Throughout New England and New York, Ohio, Michigan and other States, the maples run into money each year. But, as in every other business, the stock must be renewed and strengthened. On many farms the sugar bush is failing and the failure is severely felt. Old trees are decaying and falling, and far too few young trees have been planted to take their places. This matter must be attended to, or the loss will be a serious one. Another matter that needs attention is the extensive adulteration of maple products. This is similar in its results to the adulteration and imitation of butter, and in some localities it is just as dangerous to business. So-called "maple sugar" made from cane sugar refuse is just as injurious and objectionable as oleomargarine. Its sale should be suppressed except when sold for what it is. One who has used the delicious sirup made in Vermont or Ohio is thoroughly disgusted with the miserable imitation sold and used in our large cities.

MERLATTI, an Italian, has just fasted 30 days at Paris, without any great impairment of condition. Succi, another Italian, went through a longer fasting ordeal two months ago. Both say they were supported by the extract of a root. Merlatti's root is said to be a common Italian production, a knowledge of whose special merits is confined to the faster. Succi's root is reported to be an African production, the sustaining virtues of which he learned in a journey through the Dark Continent. It is claimed that this juice, decoction or extract, taken in very small quantities, will enable a person to go a long time without food, yet without any great impairment of mental or physical condition. It is proposed to get up a "corner" or monopoly in one or both of these marvelous plants, and sell the extract to the poor, so as to enable them to dispense in great part with the more costly ordinary nutrients. In the name of the agriculture of the globe we very earnestly protest against anything of the kind, not only because we are opposed to all corners and monopolies, but also because already there is a woeful under-consumption of agricultural products, entailing low prices. The poor of the world consume most of the food produced in the world; if they are to be in great part supported on this vaunted stuff, what is to become of the surplus breadstuffs and meat and vegetable supplies of the farmers?

WE are taking our usual pains to present our readers with the best and most comprehensive index printed by any farm or other journal in the country. The Index Number will, of course, be the last in the year. The New Year's RURAL NEW-YORKER will be dated January 1st.

Now that the subscription season is fully upon us, we shall certainly appreciate the kindly word from present readers to those who may be induced to become subscribers for 1887. *Those who with their own subscription will send us also that of a neighbor or friend will aid us greatly in increasing the* RURAL'S *circulation, which at present promises to equal, if not exceed, that of any other year.*

Two men that we know live in the same house. One drinks nothing but milk, frequently never taking a mouthful of water for days. He is strong, active and well, never sick, and rarely troubled with indigestion. If the other man should drink a glass of milk, he would be, if not sick, uncomfortable for hours. What does it mean? The same food producing such opposite results! If men are so differently constituted, of what value are the so-called "diets" prescribed for the public in general by scientists? It is popular to state, for example, in a general way, that milk is a perfect food, but where is the sense of urging it upon people to whom it is positively objectionable! In the same way, oat-meal, cheese, baked beans and other foods are recommended because they contain condensed nutriment. But in every case the taste of the eater, his mode of life, the amount of exercise he takes, etc., are hardly considered. A strong, healthy man, working in the open air, can safely eat and digest a quantity of baked beans that would make an office worker sick. Nothing could be more foolish than for a family to follow, in its diet, the random advice given in so many papers. No chemist, however able, can analyze a taste. It has been proved over and over again that people are healthiest when they eat moderate quantities of what "tastes good." If a man had no sense of taste, the various diets and prepared foods would be far more valuable than they now are. It seems evident that taste can be consulted, greatly to our advantage, in preserving our health.

EVERGREENS IN WINTER.

THE judicious placing of evergreen trees about the country houses should be made a first consideration. They should be planted so that, look in whatever direction we may, evergreens are before us. Nothing so cheers the bleak winter season; nothing adds more to the attractiveness of the home. Thickets or "clumps" of evergreens, except for special purposes, are objectionable. Each one interferes with the others and while we have a *mass* of green, yet there is no one tree that can ever develop the symmetery, the perfection of which it is capable. A single hemlock or other spruce, a retinispora, fir or pine, if treated according to its needs, becomes a grand object ever beautiful. A cluster of any one or of all becomes in a few years only a mass of green made up of unsightly individuals.

Evergreens are the out-door blessings of Winter to the country home, enlivening and warming the otherwise bleak and cheerless view. One may still enjoy a daily walk, feeling that there is some shelter from the wintry blast, something of Summer's life and warmth about him. Evergreens can never supply the place of deciduous trees in the growing season, yet if a proper distribution of each is made, either kind is an agreeable, pleasing companion to the other. It is well in planting the two classes of trees, so to place them that the deciduous trees may for the most part fill the more conspicuous sights of the grounds, the evergreens the more distant places; yet this must not be carried too far.

What we would impress upon our readers is that while evergreens in their more formal outlines may not be as necessary in adorning the home grounds as are oaks and maples, beeches and elms, during the summer season, yet even then they add the charm of variety and a beauty quite their own. But it is in Winter when the naked, stiff branches of deciduous trees stand as if monuments of Winter's destructive blasts, that the warm evergreens are most of all to be prized.

BREVITIES.

READ the concluding article on Recuperative Agriculture, by Professor Roberts, on page 809.

IF potato scab is caused by a fungus, one would suppose that the spores would be propagated and the disease occur in the cellar or storage pits. We have never known such a case.

OUR turnip crop was a failure. We have hardly enough to pay for the manure. We had to "throw in" our labor. Turnips were poor all around us. Well, better luck next year!

"ONCE in awhile the phunny-picture man on the last page of the R. N.-Y. is a success." So writes Mary Wager-Fisher. We would remind Mrs. Fisher that Punch is notorious for presenting a really funny cartoon but once a year.

PROF. SHELDON says elsewhere there is a difference of several hundred per cent. between the price of the best Irish butter and that of the worst. The same thing is true in all parts of the world, and not only with butter, but with everything else.

WE sold a few bushels of potatoes in Paterson, the other day, at 75 cents per bushel. These were sold from the wagon—delivered. Western potatoes brought about 50 cents. We have held most of our potatoes for better prices. Have we been wise?

THE rye is coming out better than we expected. The season was against it. Some farmers sowed in the dry dust, and what seeds germinated looked sickly until the rains came. Others waited until after the rains, then plowed and harrowed and sowed at once. It is coming up fairly well.

POULTRY is extraordinarily low at Chicago. At the close of last week live chickens were selling for a little over five cents a pound and early this week they sold for three to five cents per pound. Many of the consignments sold for very little more than the cost of transportation and commission, leaving little or nothing for the poultry raiser. The railroad and commission men are bound to get good pay for little work; but the farmer often gets no returns for much labor and actual outlay. Is there a remedy? If so, what is it?

SPEAKING of the "Hatch Experiment Station Bill," which proposes a liberal annual grant by the General Government to each of the agricultural colleges, to be used in agricultural experimentation in co-operation with the National Department of Agriculture, Professor Morrow says that he thinks separate experiment stations would probably be the most effective, though with the excellent facilities and the men already available at the agricultural colleges, it is doubtless true that good results could be obtained with the least expenditure from the combination of stations and colleges.

ALL reports from the Northwest indicate that the wheat crop there is considerably larger than reported before thrashing. At the time of our general crop report—July 10—the Michigan Farmer would "bet its boots" that the crop would not be so large as our reports indicated. Several other esteemed contemporaries that had never taken the trouble of getting up a general report of the kind, chimed in on the same key. It is now conceded that our estimates of the wheat crop in the Northwest, and in the rest of the country also, were considerably under rather than over the reality, though we were accused of exaggeration. What is bolder than bumptious ignorance?

THE Calf Butchers' Association was formed in this city last April. In May it entered into an agreement with all but two of the brokers in the stock-yard to buy and sell calfs on commission, with a view to controlling the market in this city. The association guaranteed the debts of its members to the brokers, and in return the latter agreed to pay the association 12 cents on each calf sold by them, and to refuse to sell to anybody outside the association under a penalty of $2 for each infringement; while the association agreed that any member who bought from any one except the brokers who belonged to the gang should forfeit 25 cents for every calf. The monopoly thus established has been able to raise the price of veal to the consumers and lower the price of calves to the farmers and pocket an extortionate profit from both parties. The Attorney-General decides that the association is illegal, and is about to bring an action to dissolve it. There should be a general law in this and every other State clearly prohibiting such oppressive organizations and punishing all engaged in them.

In addition to the long lists of humbugs and worse, given two weeks ago, we warn our readers to have no dealings with the following concerns: Sessions, W. P., Kansas City, Mo.. Wilcox, Algernon, alias Wilcox Specific Med. Co., alias Wilcox Chemical Co., alias Wilcox Chemical Preparation Co., alias the Specific Med. Co., 303 North 10th Street, alias Meyers & Co., Box 1306, Philadelphia, alias "Dr." Jennie V. Stanton & Co., New York City.... Union M'f'g Co., alias Empire M'f'g Co., alias Pioneer M'f'g Co., 79 Milk Street and 767 Washington Street, P. O. Box 5100, Boston, Mass ...Armstrong, "Prof." J. H., 737 Race Street, Philadelphia, alias Mrs. W. C. Holmes, 109 E. 12th Street, removed to 658 Broadway, New York City, alias "Dr." J. C. Raymond, Brooklyn, N. Y., alias Prof. W. H. Armstrong, So. Boston, Mass.....Adee, Daniel, 45 Liberty Street, New York City....Vau Raub, B., alias Don Carlos, Leon Springs, Tex., alias Byron H. Robb, Cincinnati, O....Foster, S. & Co., "Cigar Fraud," alias Cincinnati Pub. Co., publisher of the "Aid" and part owner of the Clipper M'f'g Co., Cincinnati, Ohio..... . Clark, L. J., alias Favorite Book and Novelty Co., alias Western Chromo Co., Wiscoy, Minn.. ..Chichester Chemical Co., alias Thomas Chichester, 2313 Madison Square, Philadelphia....Chicago Arms Co., Chicago, Ill... Crystallized Photo. Co., 53 W. 7th Street, Cincinnati, O....Tabel, Paul E., alias Advance Courier, alias Barnett Art Association, alias Inter-State M'f'g Co., alias Asa A. Burnham & Co., Chicago, Ill.

Things To Avoid.—Bohemian oats and all swindles of a like nature. These have been explained here over and over again. Seneca Chief, Red Line and Gold Dust Wheats are of this stripe ....Siguing papers for nuknown parties, however innocent the paper may appear. Not a week passes in which we do not notice accounts of swindles on farmers owiug to their excessive readiness to sign their names to papers. We have repeatedly given instances of this sort of bamboozling... ..Paying royalty to traveling scamps who claim to be agents for machines the patents on which they say have been infringed in some articles already in the farmer's possession. There are many rascals, armed with bogus papers, traveling through the country swindling farmers in this way. A good bulldog is a blessing when these fellows are around.

To Several Inquirers.—We cannot recommend now, any more than formerly, the Reliable Manufacturing Company of Philadelphia Pa., nor the Home Manufacturing Company of the same place We do not recommend Borden & Edwards of this city. We strongly advise our friends not to invest a cent in the "Imperial Austrian Vienna Government Bonds," offered temptingly for sale by the "International Banking Company" and Edward Saunders & Co. It is a mere lottery scheme and foreign lotteries are no more honest than domestic ones; while the opportunities for fraud are more numerous. .....W. L. Caldwell, of this city, is a "sawdust" swindler, who offers to sell counterfeit money.... ..."The National Bazar" of this city, is reported to be another venture of the notorious W. H. Sizer.....We do not recommend the National Supply Co., Cincinnati, Ohio.. We know nothing about "The Prof. D.W. Moody Co.," Cincinnati, Ohio or its dress-making system....The Next of Kin and Heirs-at-Law Gazette, of this city, is engaged in a disreputable business in so far as it intimates that its manager or conductor is able to recover any of the fabulous fortunes which are said to be numerous on the other side of the water. Whoever has any dealings with this concern will certainly lose $1, and is very likely to be led on until the loss is much greater....The Von Graef Troches are a humbug.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

The American Garden.—Years ago the American Garden was issued as a monthly trade paper by Beach & Co., seedsmen, of New York. The firm gave up business, and B. K. Bliss & Sons purchased the name and continued its publication in connection with their seed business. Bliss & Co. failed, and Mr. E. H. Libby purchased the Garden and has since published it in Greenfield, Mass, while at the same time he has been editing "Our Country Home." Within a few weeks Mr. Lawson Valentine, the well-known, good and benevolent owner of Houghton Farm, has purchased an interest in the American Garden, and hereafter it will be conducted by Mr. Valentine and Mr. Libby.

Mr. Libby, it may be remembered, was the founder, first, of the Scientific Farmer, then of Land and Home and, finally, the editor of the American Agriculturist, before Mr. Judd's failure. He was afterwards editor of the Farmers' Review, of Chicago, and then one of the superintendents of the immense house of Sibley & Co., the seedsmen, which position he relinquished to edit Our Country Home.

Mr. Libby is a man of remarkable energy, originality and perseverance, which, now that he is associated with Mr. Valentine, will, we are confident, show themselves in making the best garden journal of America, and we much doubt if his monthly journal has a friend that wishes it full success more sincerely than the Rural New-Yorker.

Literary.

BOOKS RECEIVED.

Lee & Shepard publish an illustrated edition of Tennyson's "Dora" which makes an admirable Christmas gift. After Enoch Arden, we like Dora better than any of Tennyson's poems. It is a beautiful little story in verse. One is never tired of reading it. The illustrations are admirable. They add much to a proper understanding of the poem. We had a different conception of "Farmer Allen" from that of the artist who designed these pictures. We had thought of him as a bluff, typical Englishman. An entirely different man looks out at us from these pages. The pictures of the other characters seem more natural. Most of the favorite modern poems have been illustrated in this way. They make beautiful holiday gifts. Dora is one of the best of the series and should be popular.

A Boston Girl's Ambitions by Virginia F. Townsend (Lee & Shepard) is a clumsy story. We should expect a far better story from this author. There is a good plot, and several of the characters are well drawn, but the parts of the story are clumsily put together, and the interest is not kept up well. Why the book should bear its name is not exactly plain. The "Boston Girl" is not a typical character by any means. She is a country girl who goes to the city with her brother with the idea of supporting herself. After nearly starving, the brother obtains a situation in the usual remarkable way, of saving the life of a little child. Just as he succeeds in mastering the business and putting himself in the way of permanent promotion, he is seized with a desire to study at Harvard and enter a profession. His sister's ambition is to help him carry out this plan. He leaves his position, and with his sister's help obtains his education and succeeds. If the book means anything at all, it means that the highest ambition a sister can have is that of adding her life to that of her ambitious brother, in the hope of making him greater. Price $1.50.

Holiday Books. Lee & Shepard issue some beautiful books for the holidays. Nature's Hallelujah is certainly one of the finest books of the season. It would make an elegant Christmas present. We can think of no more fitting present for a lover of nature than this beautiful volume. The design of the book is unique. Each page is given up to an extract from some well known poem, which is illustrated in the most striking manner. The mind of the poet, the pencil of the artist, and the skill of the engraver and printer have all combined to render this work attractive. What wonderful lessons it would teach, what wondrous good it could accomplish if it could be placed in every family in this land. Beauty, love and faith speak out from its pages. We gladly commend it to our readers as the most helpful of the holiday books we have seen. We wish all could secure it. The price varies from $6 to $12 according to the binding.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

"ALWAYS SUNRISE SOMEWHERE."

There is always sunshine somewhere!
  Though the night be round thee drawn,
Somewhere still the east is bright'ning
  With the rosy flush of dawn.
What though near the bat is flitting
  And the raven croaks his lay,
Somewhere still the sun bird's greeting
  Hails the rising of the day!

Let us lay to heart the comfort
  In this sweet reflection found,
That however dense our darkness,
  Somewhere still the world around
Dews are glistening, flowers uplifting,
  Wild birds warbling, as re-born:
Lakes and streams and woods and mountains
  Melting in the kiss of morn!

Ne'er was night, however dismal,
  But withdrew its wings of gloom;
Ne'er was sorrow, but a day-star
  Hinted of the morrow's bloom;
Ne'er was woe, but in its bosom
  Was the seed of hope impearled,
There is still a sunrise somewhere
  Speeding, speeding round the world!

—*Credit lost.*

OF INTEREST TO WOMEN.

In spite of all the ridicule showered upon the upholders of women's rights, here and there one of the sterner sex views this movement with approval. And of all trenchant, witty words on the subject the brightest are those of Robert J. Burdette. He says he is a woman suffragist because a woman has more good, hard, common sense than a man. Because she makes less bluster about her rights, and quietly maintains them better than a man. Because she won't give a dollar and a half for an article that she knows very well she can get for seventy-five cents. Because she does not stalk loftily away from the counter without her change if the robber behind it is a little reluctant about counting it out. Because she is too independent to pay the landlord two dollars for her dinner and then pay the head waiter a dollar to send her a waiter who will bring it to her for fifty cents. Because she will hold her money tightly in her own good little right hand for two hours until she first gets a receipt for it from the fellow who made her husband pay the same bill five times last year. Not any "just give you credit for it" for her. "One day," continues Mr. Burdett, "a Pullman porter complained to me: 'No money on this trip; too many women aboard. Don't never get nothin' out of a woman 'ceptin' just her reg'lar fare.' I had just paid him 25 cents for blacking one of my boots and losing the other. And when he said that, when I saw for myself the heroic firmness of these women, traveling alone, paying their fare and refusing to pay the salaries of the employés of a wealthy corporation, I said: 'These women have a right to vote. To vote! By all that is brave and self-reliant and sensible, they have a right to run the Government.'"

CONFESSIONS OF A COUNTRY GIRL.

NUMBER ONE.

I am a rural maiden, and I live in a secluded valley, "far from the madding crowd." Tall hills on either side shut out the world beyond, until I feel like Robinson Crusoe on his island, only, as Mrs. Gamp says, I was born in a wale, and must take the consequences of such a situation." Rare glimpses of city life make me feel as if the outside world was so large, and my own corner so small, that I am like a caged robin beating his wings against the bars. I love the country. To see the rocky, tree-clad hills a midsummer day, with blue haze clinging about their rugged sides; to watch the changing landscape from season to season; to live and breathe among the wholesome country atmosphere is keenest happiness. But, alas! sunshine and landscape alone are not allowed to fill the mind of a farmers' daughter. Nature may give a pressing invitation, but there's bread to bake and churning to do; the spare room must be swept, and when one is not cooking or waging a never-ending conflict with dirt and disorder, there are stockings to be mended and buttons to be sewed on. Thrice happy are men who are not obliged to wrestle with their dinner before eating it, and who can put on a garment without previous examination as to its integrity! You will think from my tone of complaint, that I'm not a model girl. That is a melancholy truth. I have the best intentions in the world, but I am always burning my pies, or breaking crockery, to say nothing of ruining my clothes in my woodland tramps. And when I manage to get a new book—it is not often, for literature is scarce enough with us—I forget the outside world until a cry of "Patty, Patty, where is that child?" interrupts my day dreams, and my mother says:

"You've forgotten those towels you were to hem, child, and while you are at it, here are Father's stockings to be mended."

Then my beloved magazine or still dearer romance is put aside, while I try, dutifully enough, to fulfill my mother's behests.

I have been reading some statistics lately, telling us how many farmers' wives yearly grow insane. I think it was Washington who said: "Agriculture is the most useful, the most healthful and the most ennobling of occupations." Strange, that these three-fold blessings seem to descend upon the farmer, without including his wife. I live in a fairly prosperous community, but even here the women age much earlier than the men, and have a more anxious, careworn look. This ought not to be, but it is such a noticeable fact that one is inclined to think it doesn't pay to be a woman. Simple domesticity, to the exclusion of every other interest, is the leading cause of this condition. The only cure is undoubtedly change and other mental occupation. An old English proverb says, "He who drinks beer, thinks beer," and the woman who spends eighteen hours a day in grinding work and cares will certainly think only of grinding work and cares. But every busy housewife to whom this applies will tell you at once that there is no possibility of lightening her work. There is the possibility, but it means neglect of some so-called duty. Duty ceases to be duty when it injures the bodily or mental health. Dear, dear! I'm only a girl, but I do want to get up and tell all the overworked farmers' wives to take a little rest and comfort as they go along, and remember their duty to themselves as well as to others. There, I have finished my little homily; next week I want to say something to the girls, if my audience will listen to me.

PATTY GARTON.

ECONOMY IN FURNISHING A PRETTY PARLOR FOR SEVENTY-FIVE DOLLARS.

Many young people, just starting in life, are sorely exercised in mind by the apparent impossibility of combining taste with cheapness. It is hoped that the present article will be of some assistance in such a case. We have a somewhat difficult task before us—with a small sum of money and a large outlay of taste and ingenuity we are to produce, like Madame Arachne,

"The prettiest little parlor that ever you did spy."

We may imagine a plain, square room, lighted by three windows; the hard-finished walls tinted a delicate flesh-pink, the ceiling a soft greenish-gray. Around the wall, next the ceiling, is a frieze or border of maroon and gold paper, about six inches deep. The tinting is done with kalsomine, and is pretty, durable and inexpensive, possessing many advantages over paper.

The first thing to be considered in our ideal furnishing is the floor, and here arises a most important question, to carpet or not to carpet. Looking practically at the matter, a good ingrain or Kidderminster carpet will certainly absorb one-third of our purchasing money—the most ordinary Brussels much more, leaving little for more than barest necessaries. From an æsthetic standpoint, no room has a right to a carpet until it possesses some added touch of beauty, a graceful vase or dainty etching. So we decide to be carpetless, save for a large rug in the center of the floor, which leaves about three feet of bare floor on each side. A second rug is placed in front of the fireplace or stove. The boards of the floor should be either oiled or stained. If it is wood with a handsome grain or color, such as yellow pine or oak, oiling will be most effective. Use linseed oil which must be applied hot; the easiest way is to have a pan of hot coals, and stand the oil in a cup on this. Put it on the floor like paint; the hotter it is the sooner it will dry. A room of the given size would probably take about three quarts of oil; cost, sixty cents a gallon. If we wish to stain our floor, we can buy staining material at a paint shop to imitate any wood—cherry, walnut, etc.; it costs about the same as the oil, and is applied like ordinary paint. Either oiled or stained, a coat of shellac varnish would greatly improve the floor, giving it a very handsome polish. Our two Smyrna rugs, which must show crimson as their prevailing color, will cost about fifteen dollars, so the carpet question is solved, both artistically and economically.

The windows next claim our attention. We should get good shades of Scotch holland; they are a pretty tan or écru, giving a very pleasant light to the room. With spring rollers all complete, they will cost a dollar and forty cents each. The windows may be finished with poles and lambrequins, the poles being ash with wooden rings; they will probably cost about seventy cents each. The lambrequins should be plain breadths of crimson felt, or some mingled curtain stuff, three-quarters of a yard deep. This should be fastened to the rings, so that it will fall in straight folds from the pole. It is impossible to give more than an estimate of the price, but poles and lambrequins complete need not cost more than five dollars.

Fortunately for us, parlor sets are out of date, and it is not at all necessary to have even two chairs alike. So we will buy one pretty willow rocker, three quaint little chairs of light wood, which lend themselves very readily to the decorator's art, a restful, sleepy-hollow chair, and a tête-a-tête lounge, the two latter articles being upholstered in jute. Our seats should amount to about 31 dollars.

Next we should get a little gypsy table, and decorate it ourselves, covering the top with crimson felt, drawn smoothly over the edge, trimming it with furniture fringe fastened on with brass-headed nails. The table and its "fixins" will cost but two dollars, and it makes a charming little stand for our nick-nacks. We will then be extravagant enough to purchase a library table of ash, the top covered with crimson felt, which will cost us 10 dollars. On this we will stand our lamp and our pet books, but *not* the family Bible, carefully covered with a crocheted shroud, as is the custom in many country households. Sacred and devotional books should find their fittest place on the dressing-table or bedside bookshelf—it seems wanting in respect to lay them side by side with albums and gift books.

We may now consider our heavier furnishing finished; we have our necessaries, and next turn our attention to the superfluities which may mean so much, or so little according to the taste of the designer. We have about seven dollars to spend in this direction, and the first object of our care must be the mantel. An observant writer says he can always judge a woman's taste by her parlor mantel, and though this may seem a sweeping assertion it is in most cases very nearly true. Marble mantels, with that attendant horror, the marble-topped centre-table are now relegated to the eternal shades; whether wood or marble, our shelf must be covered by a lambrequin or scarf. A new and graceful style is to have

the lambrequin hanging curtain-wise from a pole at the back. For this you require a curtain pole—corresponding, of course, with those at the windows—the length of the mantel-piece. This is fastened to the wall 15 inches above the shelf. The scarf or lambrequin is a strip of dark crimson felt 27 inches deep. It is fastened to the rings of the pole, hanging flat against the wall to the shelf, where it is held by a few invisible tacks to keep it from slipping forward. It covers the shelf, hanging over the edge, for the depth of about two inches. At each end the piece covering the shelf should be about 15 inches longer than the curtain-part at the back, so that it will hang over the ends with a scarf-like effect. The ends should be decorated with embroidery, and edged with gilt crescents. A charming trimming, and one within the reach of those not gifted in embroidery, is cretonne outlined in tinsel. We do not mean appliqué work, but bands of cretonne, with the pattern both outlined and filled in with colored tinsel, and the background worked with crazy stitch floss. Cretonne with a handsome arabesque pattern should be chosen, showing up distinctly on a dark or light ground; it looks like some quaint oriental stuff when worked. And the wall decorations? Well, you may soon accumulate from art publications a few dainty etchings, to be surrounded by gray-white mats and flat bronze frames—you may happily possess some of your grandmother's plates, which are fastened to the wall by placque hangers, and a corner bracket or two would support charming, but inexpensive plaster casts. Your mantel drapery will show off your china to great advantage, and though inexpensive in the extreme, our ideal parlor will be a joy forever to its deft-fingered creative genius.

SOME WAYS AND THINGS AT THE RURAL GROUNDS.

ALICE BROWN.

It is the middle of November; the soberest aspect of Autumn is here and gives promise that Winter will not delay its coming much longer.

The trees are nearly leafless, the Golden Oak and the Weeping Beech are almost the only deciduous trees still holding a few green leaves.

The hurry and push that came with the growing buds and rampant weeds of Spring in fields and gardens, settled into more leisurely work as the leaves fell and the weeds were killed by frosts. But when the active worker finds nothing to do in the fields he continues his work indoors. So here, although the Grounds are deserted, the household is as busy as ever. The children took up their studies the first of October, the house-cleaning began soon after, the work on the seed distribution will soon commence, and a Winter of work lies mapped out before us.

Regular duties, regular studies with some purpose and some aim in life, seem to be the watchwords here, and added to these some pleasure, some happiness in each day if possible. The necessity of work is recognized in many households where the need for recreation is quite forgotten.

The routine here includes a variety of duties; house-work is planned so that each day of the week has its regular share. The washing is done on Monday by a woman living in the neighborhood. On Tuesday the ironing is begun by the girl employed in the house. On Wednesday the week's cleaning begins in the kitchen and the upper and lower hall, on Thursday two bedrooms are cleaned and a third one on Friday. On Saturday the halls and kitchen are again cleaned.

Mrs. Carman makes the bread for the family, twelve loaves every week, irons the "gude mon's" collars and often his shirts, superintends the cooking, sometimes making soups and cooking savory dishes that call forth warm praises from the children; these things and a hundred others she does and does well, in addition to her editorial work and regular studying. It is a source of pleasant wonder to me where she finds the hours for all she does. The RURAL is indebted to her for its carefully prepared index, and every week part of one day is given to the work of indexing the last paper.

Two hours every day are spent in reading the agricultural papers of the country for items that the RURAL readers find under "What Others Say." Parts of Thursdays and Fridays are given to the work of editing her department. An hour or two of study in some text book, chemistry, philosophy, botany or Latin takes its share of every day. Just now Mrs. Carman and I have joined Cerise in her study of Arnold's First Latin Book, and we recite together four days of each week in the editor's "paper carpeted" sanctum.

At half past three, when school is finished for the day, we spend about half an hour in a brisk walk. These walks are a daily pleasure and are better than anything else to make Winter seem cheery; we share all its moods and see its beauties.

Snow and rain and sticky roads only call out wraps that defy them and overshoes that protect from their moisture and mud. Sometimes in our walks we go to the east toward River Edge, sometimes west, a favorite walk through a lane to the top of a gentle slope, where we look eastward over intervening valleys to the wooded Palisades of the Hudson, or we go north and south along level stretches of country road bordered by sumacs, blackberry vines, gray heads of the golden rod in its winter guise and the seed umbels of the wild carrot that open and close in a curious fashion with the changing weather.

To one who has never tried the plan of going out every day through the Winter, it seems like an impossible thing for a busy person to do. Or if not impossible, a disagreeable thing. "What would the neighbors say to see me walking, as though for a wager, past their houses every day?" is often the first and final objection to the plan. But if undertaken, the oddity soon wears away, while the benefits are lasting. Suitable wraps are very necessary, not showy or expensive, but warm and not too heavy. Goods from an old felt skirt, lined with the material from an old woolen dress, made me a short warm sack for my walks all one Winter; mittens, hood and overshoes completed the outfit.

If dressed thinly so the wind pierces through one as soon as he steps from the door, little benefit will come from the out-door air. But comfortably wrapped there is a sense of freedom in defying the wintry air, and a feeling that the country in its leafless sleep is all one's own.

When we began our regular walks about the first of November, we could not go far without feeling tired, but a little practice has brought back our strength of last Winter, so when we have time enough, two miles seem short.

Supper is a little after five, and the evenings are divided between pleasure and study. While Mrs. Carman reads aloud to Mr. Carman in his office, from books, magazines or papers, Cerise spends an hour at her lessons, Travers amuses himself in a variety of ways, and my time at present is given to Latin conjugations and declensions.

The first hour after supper is often spent in the parlor, where Mrs. Carman plays the piano, Mr. Carman the violin or banjo, Cerise the banjo, and Travers finds music in a tambourine. Saturday evenings all work is laid aside and it is made a time of social pleasure. One of the assistant editors, who lives near, often comes in to widen the circle and join in the games or music.

Times of depression and gloom come here sometimes, when work seems hard, when the country seems lonely and nothing seems worth the effort needed to gain it. Who is there that does not know what the feeling is? Who does not want at times to fly away from the routine of his life? But the old feeling of pleasure in everyday living comes back again and the household skies brighten once more into gladness and enjoyment of simple, common pleasures.

FANCIES IN CHINA.

The changes of fashion in china and table decorations are as arbitrary, and to many feminine minds more interesting than those in dress.

A cracker-jar is a new addition to the regular dinner set. It is about the size of a quart fruit can, is prettily decorated and has a close fitting cover.

For celery there comes a flat boat-shaped dish with a long curving handle like the neck of a swan. Little dishes for fish sauce in the shape of a plump fish have one side hollowed out as a receptacle for sauce; the tail turns upward slightly curved and serves for a handle.

A new roll tray has a decoration in facsimile of a folded and fringed napkin laid on the dish. They are pretty for hot breakfast rolls or may be used for boiled corn, being oblong in shape.

Bone dishes, now accompany all the nice dinner sets. They are curved so as to fit the rim of the plate, and are placed close to it to receive the bones and debris that otherwise would encumber the plate.

Oatmeal bowls about two inches deep, with fluted or fancy edges have saucers belonging to them. They cost about 30 cents each.

A platter that is not altogether new, but very convenient has a corrugated bottom, and slopes slightly toward one end where there is a gravy well. SELMA CLARE.

GOLDEN GRAINS.

Everyone must see daily instances of people who complain from a mere habit of complaining; and make their friends uneasy and strangers merry by murmuring at evils that do not exist, and repining at grievances which they do not really feel .....

Dr. Packard says we may, in one sense, make too much of our work, our responsibility, our pressing anxiety for souls. Jesus Christ invites us to himself, to enjoy his word, and be comforted in his presence. This is as much our prerogative as it is that of any of our hearers.....

Religious work may usurp the place of religious life, and we may be so anxious for success in high and truly great things, that devotion and love and peace and joy may come to stand as secondary. They are primary. That is our first call—to Christ's side. Thence he sends us out with his love in our hearts .....

Perhaps a revival would come soonest if we forget it, and drew nearer Christ. And yet we are to use common sense methods in arousing and guiding the public mind. We must watch and pray.....

Thomas Manton says: "As husbandmen when their ground is overflowed by water, make ditches and water-furrows to carry it away, so when our minds and thoughts are overwhelmed with trouble, it is good to divert them by some other matter. But every diversion becometh not the saints; it must be a holy diversion as with the Psalmists: 'In the multitude of my thoughts within me, thy comforts delight my soul.'".....

The Baptist Weekly reminds it readers that the cheerful are the busy. When trouble knocks at your door or rings the bell, he will generally retire if you send him word you are engaged..... .....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

CLOTHES POUNDER.

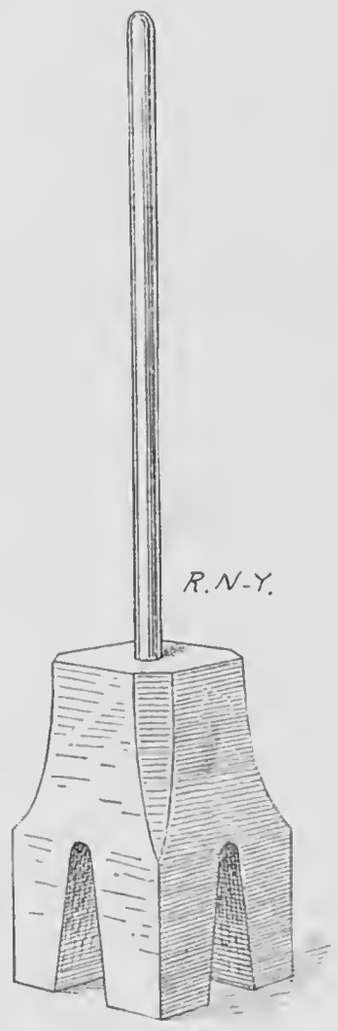

Fig. 449.

The above is very convenient as well as a labor-saving device for washing quilts, blankets and all kinds of woolen goods. It is made out of a block of dry basswood eight inches in length and four in width. The upper half is shaved away until it is barely three inches across the top, and the corners are cut off as shown in the illustration. V-shaped pieces are sawed out of each side, leaving four prongs. Bore a hole in the top large enough to insert an old broom handle and the thing is done. CANADIAN.

CHRISTMAS STITCHES IN SANTA CLAUS LAND.

ANNIE L. JACK.

So many stockings to fill! I do not wonder that Mr. and Mrs. Santa Claus often get tired and discouraged, especially when they do not know how their gifts will be received. I called upon Mrs. S. quite lately. She does not get much credit for helping the old saint, but like many another wife, is content to let him get all the credit. She was busy knitting a blue wool toque, a chain for a foundation large enough for some fair-haired miss; then she added four chains to the foundation, then three loops through the other three of the four and three loops through the following two loops of the foundation; pull a loop through all the loops now on the needle, one chain, take up five loops, the first through the stitch above, where the five loops were worked off together. Many people prefer to make their own familiar stitch in crochet, but the toque must be three-eighths of a yard long. Join the ends neatly, gather the top of the cap and place there a crocheted cord and tassel. Tack this with the end down on the join to conceal the seam, and then turn the cap up to suit the face.

Another very useful thing she was making for an old lady was a pair of foot muffs. They were of double wool on wooden needles. A strip a little wider than the length of the foot, knit backward and forward till the piece was 20 inches long, then cast off, and the ends sewed together into a bag with an elastic in it to fit the ankle. Lying in a basket about the workshop were some very pretty calendars; and I found that she got them from merchants who gave them away—and with a pot of glue she pasted them on to pretty artistic backgrounds, either cut out or painted, for she can use the artist's brush to advantage. I noticed, too, that in dressing dolls she had a lot of cardinal Jerseys, and they were all made out of some closely woven but half-worn stockings.

In the workshop I saw all the work that this industrious wife had done. Pretty photograph frames in birch-bark, and canoes and baskets of the same material, filled with moss and bitter-sweet, or with home-made candy. There was a fire-screen, too, made of the pretty, shiny feathers of tame ducks and other fowl, stitched on to a five-cent fan that had first been painted brown. Then there were some cheap dus-pans that were similarly painted, with the handles done in red, and tied with a ribbon. Many a housekeeper would value this better than some useless article. A pretty gift where ferns and autumn leaves can be obtained, is made by bleaching some of the former in soft water and chloride of lime. Cleanse them after rinsing in clean water, with blotting paper, and pin up stiffly; the autumn leaves are simply pressed. These on paste-board in the shape of a placque and mounted in velvet, are bright and pretty pictures, of interest to the giver and the recipient, if place and date of gathering are mentioned in a corner.

There were splendid stocking bags in Santa Claus land, made of cretonne and gathered at the top with little rings and ribbons, and I saw the loveliest cushions all filled with balsam needles and having different covers according to fancy; but substantial enough to put one's head on them for rest and healthful breathing, and I suggested to the old lady that I thought she ought to have a few hop pillows, for if she could grow the hops the pillows would only cost the making up in pretty cretonne, and would be a great comfort to sleepless people or those that suffered from headache. She had a lot of boxes and baskets filled with fruit—grapes or apples, or assorted baskets—and I felt sure they would prove very acceptable gifts to those who did not have them without purchasing. A pot of hyacinths or other plants would be another nice gift.

ONE WINTER.—IV.

ANNE THRIFTY.

We all rose from the table to welcome our visitor. He handed the jug he carried to Sammie, and the sack to Uncle John, saying "The women folks sent these things to you; they don't amount to much, but we thought Annie 'd like some real country fixings to cook with, so I brought them along." While he explained, the boys had found that the jug contained sorghum molasses, and their beaming faces showed how much the discovery delighted them, for they were as fond of sweets as young cubs. Uncle John invited his brother-in-law to a seat at the supper table, but he had eaten supper with a friend who came in from the country with him, so Uncle John turned his attention to the contents of the sack while he asked after all the relatives at Rockmade Farm. A smoked ham, two bags of dried apples, one of sweet, the other of sour apples, and a peck of popcorn came out of the depths of the sack.

Country housekeepers with ample stores of all kinds in cellar and closet can hardly realize how I valued these things from the farm, and the thanks I tried to express were not half what I felt.

These simple gifts coming as they did at the close of a happy Thanksgiving Day, made us all feel doubly thankful. We lengthened the evening and allowed the boys to sit up to "see Uncle Rob," as they begged to do, until he bade us good-by and good night, and left us to join the friend he had brought with him to the city.

The holiday over, we all went to work again and as I put away the dried fruit the next morning the remembrance came to me of a cake my mother sometimes made of dried apples. We had considered cake beyond our

means altogether, but now I determined to make one for a Christmas surprise. The cake though to be made of dried apples and sorghum molasses would be, I knew, a good fruit cake if I succeeded with it, for when made by my mother we had all thought it equal to many more expensive fruit cakes and less indigestible.

Waiting until the next week, when the boys were away at school, I put some of the sweet apples to soak over-night, and the next morning, as soon as the boys were out of sight, chopped three cupfuls into pieces about the size of a pea, and put them into two cups of molasses to simmer until waxy. While they stewed I searched through the cupboard for spices, but could only find a little cinnamon. This was an unexpected discovery, but having begun the cake, some plan must be devised to finish it. I wanted to surprise uncle and did not want to ask for a little money without saying how it would be spent. I had a dollar and a half of my own I had been saving to spend for a distant friend at Christmas time, but now I decided part of that should go into my cake and less into my Christmas token. When the apples were almost candied, I put them high in the safe to cool, and, locking the house, went out to buy the spices I needed and a little coffee to use as a spice, getting home with them just in time to prepare dinner. Having little variety to cook, I was often puzzled to make it seem more by varying the cooking. On this day I hit upon a dessert that pleased the boys very much. Popping a dish full of pop-corn we ate it with milk and salt and called it popped pudding.

When the boys were off for the afternoon I made haste to get my cake ready for the oven. Stirring together a large spoonful of butter, two eggs (carefully saved for the purpose), a half cupful of sugar and a half cupful of milk, I was soon ready to add the apples, spices and a tablespoonful of finely ground coffee, two teaspoonfuls of soda and five cups of flour This made a large cake, and I left it in the oven with a steady heat for an hour and a half. The odor of the spices filled the kitchen with their fragrance, and I feared my surprise would reveal itself at once; but fried ham for supper soon filled the kitchen with another odor and the cake was safe from discovery.

FOR WEAK EYES.

A FRIEND writes: "A famous oculist, Dr. Merrill, of Albany, N. Y., whom I consulted for weak eyes, advised me to dash quite warm water half a dozen times over my closed eyes twice a day, and to dry them carefully before opening. This simple remedy regularly and persistently followed, helped me when more pretentious ones failed."

INEXPENSIVE SIDE DISHES.

A DELICIOUS little side dish will often redeem a dinner from absolute inferiority. The remnants to be found in even a small larder will generally suffice to make some dainty at little more than the cost of the trouble. Odds and ends of game and poultry are especially happy in possibilities. Mince the meat as finely as your patience will permit; fry some fancy shapes of bread and spread them with the mince; sprinkle over this some ham that has been finely minced with parsley; if a hard-boiled egg is also chopped with the ham, it is a pleasant addition, and a good use for an egg that may be left from breakfast. Canned chicken or turkey may be used in the same way. A cream sauce poured around these *croutons* with the mince makes another pleasant change.

The few spoonfuls of cold boiled rice that looks so blue and unappetizing that there seems no excuse for not throwing it away, can be very easily converted into sweet or savory morsels. Here is one of the latter: Take equal quantities of rice and bread-crumbs, half as much minced bacon or fat meat cooked, and double the quantity of that in lean cooked meat, also minced. A few bits of underdone beef or a little stuffed veal is especially nice. Add the usual seasoning for croquettes—salt, pepper, nutmeg, parsley, and if you have any at hand, a very little cooked onion. Moisten this with a little stock and bind with a beaten egg; shape them in round or oval cakes and fry brown in hot fat. Cooked macaroni, cut into very small pieces, may be used instead of the rice.

The remains of a tin of anchovy or shrimp paste that is often thrown away, can be utilized in making the celebrated "Club or Indian Toast." Make some hot buttered toast, and spread over a very little curry paste, and next a tiny bit of anchovy or shrimp paste. While this is being prepared, have in the oven two or three boned sardines, spread with butter and seasoned with lemon juice: as soon as they are hot through, lay them on toast and serve.

Boudinettes (small sausages) can be made from almost anything in the way of fish, flesh or fowl. Mix a quantity of either finely minced with half its weight of mashed potatoes, and a little sauce, parsley, anchovey, or even plain melted butter, or a spoonful or two of cream may be used instead of either. Make all this hot, seasoning nicely, and stir until it leaves the bottom and sides of the saucepan. When cool, add one beaten egg for each pint bowlful of the mixture, mold into little balls, dip in beaten egg and bread-crumbs and fry.

Oyster *boudinettes* are great dainties. They may be made from canned oysters, but, of course, are better if the fresh are used. Melt an ounce of butter in a saucepan, add an ounce of flour and cook for two minutes, then stir in one gill of cream and another of milk, and a cupful of minced oysters, add to the usual seasonings, a dash of anchovy sauce, and the least bit of grated lemon rind. Add a beaten egg, dip in egg and crumbs and fry.

The making of salads is another way in which remnants can be utilized. A good fish salad can be made as follows: Cover the bottom of the dish with flakes of cold fish, next put a layer of potatoes (cold, boiled, of course), then some boiled beets thinly sliced and celery cut into dice. Cut two or three pickled gherkins into slices and two hard-boiled eggs, and add them, with a few capers, to the dish. Cover with a thick salad dressing for which several different recipes have been given in the RURAL, garnish with celery tops.

Stewed apple pudding is wholesome and will be liked by many Pare and quarter two quarts of tart apples, and put them over the fire with a tablespoonful of butter and a cup of sugar and another of water; meantime mix a pint of flour with two scant teaspoonfuls of baking powder, one of sugar, and half a teaspoonful of salt; wet this with a scant teacupful of milk, and roll the dough down to the size of the cover of the pan in which the apples are cooking. Spread it over the boiling apples, draw the pan where it will simmer, and cook for 25 minutes. Slip a skimmer under the crust, lift it into a dish, pour the apples into a deep dish and place the crust on top. A homely sauce for this is made by boiling half a cup of molasses and one of water for three-quarters of an hour. It is excellent if simple cream is used for a sauce.

PALMETTO.

DOMESTIC RECIPES.

PLAIN TEA CAKE.

THREE teacupfuls of dry powdered sugar, one cup of butter, one cup of sour milk, three pints of flour, three beaten eggs, half a teaspoonful of soda, flavor to the taste. Roll thin and bake in a quick oven.

NAMELESS CAKE.

ONE cup of sugar, whites of four eggs, one-half cup of butter, one teaspoonful of lemon essence, one large cup of flour, one-half teaspoonful of soda, one of cream-of-tartar stirred in the flour.

WHITE CAKE.

WHITES of three eggs, one cup white sugar, two teaspoonfuls of cream-of-tartar, one of soda, one half cup of sweet milk, butter size of an egg, three cups of flour.

MRS. H'S SUET PUDDING.

ONE cup of suet, a little more than one cup of milk, one cup of molasses, one cup of chopped raisins, four cups of flour, three teaspoons of baking powder, a little salt, one teaspoonful each of cloves, allspice and cinnamon. Steam three or four hours.

AUNT MINA'S GINGERBREAD.

Two cups of molasses, one cup of cream, one cup of butter, two tablespoonfuls of pearlash, piece of alum size of a pea.

GINGERBREAD NO. 2.

ONE-HALF cup of sugar, one cup of molasses, one cup of butter, one egg, two-thirds of a cup of hot water, two cups of flour, two-thirds of a teaspoonful each of ginger and cinnamon, one teaspoonful of soda.

DOUGHNUTS; MOTHER'S RECIPE.

Two and a half cup of sugar, four eggs, one cup of thick, sour cream, one teaspoonful of soda dissolved in a tablespoon of hot water, salt and nutmeg.

KATE'S RECIPE.

ONE and one half cups of sugar, one cup of buttermilk, two eggs, four tablespoonfuls of melted butter, one teaspoonful of soda, one of salt, half a teaspoonful of cinnamon.

CARRIE'S RECIPE.

ONE and one half cup of sugar, three eggs, one cup of sweet milk, four or five tablespoonfuls of melted butter or lard, a teaspoonful of salt, a pinch of cinnamon and allspice, two teaspoonfuls of baking powder stirred in the flour.

MRS. J'S COOKIES.

THREE cups of flour, one cup of sugar, one cup of butter, two eggs, three tablespoonfuls of sour milk, one even teaspoonful of soda, one of extract of lemon.

MRS. B'S COOKIES.

Two cups of sugar, four eggs, half a teaspoonful of cinnamon, five tablespoonfuls of sweet milk, one teaspoonful of soda, one teacup of butter, not melted but rubbed in the sugar.

HARTSHORN COOKIES.

THREE cups of sugar, two teaspoonfuls of Baker's Hartshorn, pulverized, one pint of cream, or half cream and half buttermilk. Mix, roll out and bake any shape desired. Much relished by invalids. AUNT RACHEL.

CREAM CAKE.

ONE cup of butter, two cups of sugar, whites of two eggs, three-and-a-half cups of flour, one cup of sweet milk, one teaspoonful of soda, one teaspoonful of cream-of-tartar For the cream: one pint of sweet milk sweetened to taste, yelks of three eggs: thicken with flour to the consistency of custard, flavor with lemon. This amount makes two good-sized cakes.

VIRGINIA APPLE CAKE.

TAKE one cup of bread dough, work into it one egg, one-half cup of butter, and one-and-a-half cup of sugar. Roll about one inch thick, put in a long pan, then slice good cooking apples smoothly over the dough, sprinkle with sugar, butter and cinnamon and bake. It is a grand favorite for tea cake.

FRIED APPLES.

PARE nice sour cooking apples, cut crossways, remove the core, roll in flour and sugar mixed, and fry in hot lard or butter, when brown on one side turn over. Please try them.

MRS. H. C. U.

TRIED RECIPES FROM VARIOUS HOUSEKEEPERS.

POTTED SHANK.

BOIL a shank of beef till tender, chop the meat up, and season it with salt, pepper and (if liked) half a nutmeg. Reduce the liquor to three pints, add the meat, cool in a mold. It should turn out well when cold.

TOMATO SOUP.

SKIN and stew sufficient ripe tomatoes to make a quart. Add salt, white pepper, a bit of butter, a small teaspoonful of sugar and either a quart of milk or half milk, half stock. Thicken with three pounded biscuits, boil up and serve. This soup bears heating up well. Where tinned tomatoes are used, boil them with half a teaspoonful of carbonate of soda before adding the ingredients.

BREAD FRITTERS.

CUT thin round slices of bread, butter them very thinly, spread with jam and stick together in pairs. Fry in boiling lard, after dipping them in a batter of one egg, one pint milk, a pinch of salt and flour enough to make a pancake batter. Pile high on a dish and sprinkle with sugar.

CORN FRITTERS.

GRATE cold boiled corn from the cob, season, add three beaten eggs and sufficient flour to give them consistency. Drop in large spoonfuls into boiling lard or dripping, and fry a nice brown. Canned corn may be used.

CURRIED EGGS.

MELT a little butter, stir in a teaspoonful of curry powder, add by degrees a large tablespoonful of flour, and a cup of stock, season. Boil six eggs hard, cut them in halves, put neatly in a deep dish, pour on the sauce, and keep all hot a little before using.

It is always pleasant to exchange recipes with other housekeepers, to learn their methods and be benefited by their experience. A good plan is to keep a book and paste into it all the good things one finds in stray newspapers to be tried at leisure. In this way one learns many housekeeping details that would otherwise be lost, and can compare methods and choose the best. A. L. J.

COOKED CELERY.

Stewed celery is such good eating that we wonder at its not being more popular. One day we eat in the raw state only the tender, blanched stalks from three or four bunches, while the coarse, given parts are put into water and set in a cool place until the next day. The pieces are then cut into inch lengths and stewed in only enough water to keep from burning until perfectly tender—time usually two hours. Drain off the water, add a cup of milk, and season with butter, pepper and salt. Occasionally we vary this method of cooking and have what we call "winter asparagus." Cut into six or seven-inch lengths; tie into bunches, bind up with a bit of white mosquito net, and cook in salted water until tender. Toast some thin slices of bread, put on to a platter, arrange the celery on the toast and pour over all a dressing made of a pint of milk slightly thickened with a little corn starch, and seasoned with pepper, salt and a spoonful of butter. Pieces of lemon are pretty as a garnish, and the juice is an acceptable addition to many persons.

Debility

Languor, and Loss of Appetite, are cured by the use of Ayer's Sarsaparilla. It removes that terrible sense of *Constant Weariness*, from which so many suffer, gives tone and vigor to the stomach, and restores health and strength more surely and speedily than any other medicine.

Three years ago I suffered from Debility and Loss of Appetite, the result of Liver Disease. After having tried various remedies, and consulted several physicians, without benefit, I was induced to take Ayer's Sarsaparilla. The first bottle produced a marked change, and the second and third accomplished so much that I felt like a new man. I have, since that time, taken about one bottle every year, and had no recurrence of the trouble.—William E. Way, East Lempster, N. H.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

GOLD $100.

We will pay one hundred dollars gold in premiums for best results from eight weeks' trial of **Sheridan's Powder to Make Hens Lay.** Send your name and post-office for particulars. I. S. JOHNSON & CO., 22 CUSTOM HOUSE STREET, BOSTON, MASS.

MASON & HAMLIN

ORGANS.

Highest Honors at all Great World's Exhibitions for nineteen years. 100 styles, $22 to $900. For Cash, Easy Payments, or Rented. Catalogue, 46 pp., 4to, free.

PIANOS.

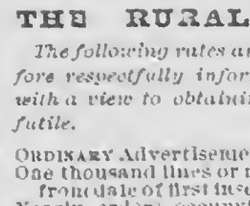
The Improved Method of Stringing, introduced and perfected by MASON & HAMLIN, is conceded by competent judges to constitute a radical advance in Pianoforte construction.

Do not require one-quarter as much tuning as Pianos generally. Descriptive Catalogue by mail.

ORGAN & PIANO CO

154 Tremont St., Boston. 149 Wabash Ave., Chicago. 46 E. 14t St. (Union Sq.), N. Y.

ON 30 DAYS' TRIAL.



THIS NEW **ELASTIC TRUSS** Has a Pad different from all others, is cup shape, with Self-adjusting Ball in center, adapts itself to all positions of the body while the ball in the cup presses back the intestines just as a person does with the finger. With light pressure the Hernia is held securely day and night, and a radical cure certain. It is easy, durable and cheap. Sent by mail. Circulars free EGGLESTON TRUSS CO., Chicago, Ill.

News of the Week.

HOME NEWS.

SATURDAY, Nov. 27, 1886.

THE funeral of ex-President Chester Arthur took place from the Protestant Episcopal Church Heavenly Rest in New York, Monday. No services at the house. Large crowds in the street, but no display. Among those present were President Cleveland, James G. Blaine, Roscoe Conkling, ex-President Hayes, Governor Hill, mayors of various cities, the Congressional delegations, representatives from the United States Supreme Court and former members of Arthur's Cabinet. The funeral train left for Albany at 10:20 A. M., where it arrived at 1:22 P. M. Thence it proceeded almost immediately to the Rural Cemetary. Here Bishop Doane read the burial service of the Protestant Episcopal Church. All members of the Albany city government were present, and all public offices were closed during the funeral..... .At the close of business October 30, of the $1,153,443,183 interest-bearing debt the books of the Register of the Treasury show that $1,011,222,062 was registered. Of this amount $11,688,100 was held by foreign holders, $292,583,200 by the Treasurer of the United States for national bank securities, and of the remainding, $706,950,762, insurance companies held $61,507,000; savings banks, trust institutions, etc., $118,597,000, and individual trustees $456,846,762. Only one per cent. of the registered bonds is held abroad. There are about 53,500 individual and trustee holders, representing $466,846,262, or an average of $8,726 each ....There are scandalous reports that Judge Manning, of Louisiana, the newly appointed Minister to Mexico, has been grossly drunk at the Mexican capital. The charges are lightly regarded at the State Department. There appears to be a clique of scandal-mongers down there..... ...Erastus Brooks, the well-known editor and politician of this city, died at his home on Staten Island on Thanksgiving morning.....Ex-Gov. Chaney, of Manchester, N. H., has been appointed United States Senator to succeed Austin F. Pike, deceased... .....H. M. Hoxie, first vice-president of the Missouri Pacific Railroad, died in New York, Tuesday. He had entire control of the Gould Southwestern system during the great strike last Summer, and his great exertions thoroughly broke him down. He had filled nearly every position on a railroad from brakeman to vice-president.....Ex-Vice-President Wheeler is said to be a total wreck physically and mentally at his home in Malone, N. Y., and a physician is in constant attendance..... ....Senator Wade Hampton while deer hunting on his Mississippi plantation, on Monday, became separated from the rest of the party, who, toward evening, supposing that the Senator had left the field, returned home. At eight o'clock that night General Hampton being still absent, a searching party started out and found the old General a short distance from the house, much exhausted and painfully hurt, but making his way homeward. At about three o'clock in the afternoon, as he was riding through a thick wood where vines were numerous, a "Supple Jack" vine caught his gun and discharged it, the load of buckshot entering the head of his horse, killing the beast instantly. The animal fell on Senator Hampton, and in his mained condition it took him some time to extricate himself. He had been walking through the woods for nearly five hours with only one good leg ....Ex-Gov. John S. Phelps, of Missouri, died at St. Louis Saturday night at the age of 72. Born in Simsbury, Ct., was educated at Washington, now Trinity College, and went to Missouri in 1843..... .. ....William Reed, Treasurer of the South Boston Horse Railroad Co., has embezzled $104,000—turpitude going on for five years; meanwhile he has had a high reputation for religion and honesty....Owing to excessive charges of the Bell Telephone Company, 400 users of phones in Rochester, N. Y., struck on November 7. They have been trying a new telephone invented by Dann and Lapp, of Honeoye Falls, N. Y., and it is said to give entire satisfaction. It is constructed on the principle of making and breaking the circuit instead of having a continuous circuit, as in the Bell telephone. It doesn't infringe on the Bell patents, and a new company to run it is being organized . .The estimated whiskey product of Kentucky for the year ending June 30, 1887, is 13,503,837 gallons.....The Treasury Department has decided that anchovy is dutiable at the rate of 35 per cent. ad valorem.... ... Five hundred acres have been added to the St. Joseph stock yards, and $200,000 will be expended upon them.....A dispatch from St. Louis says another strike on the Atlantic Railway system is imminent unless concessions are made to the employés.....Thanksgiving's storm on Lake Michigan was the severest ever known, and there are fears for the safety of many vessels. Latest estimates of losses from last week's storms: 36 vessels; 44 lives; $724,000.. . .Same day heavy snow and sleet storms are reported in many parts of the Middle States and fierce blizzards in the Northwest. Reports of eight people frozen to death in different parts of Dakota..... ..The execution of the Chicago Anarchists was to take place on Dec. 5.; but the penalty has been suspended till the full bench of the Supreme Court has passed upon the question for a new trial .....It appears that the Dominion Government is about to establish a bureau of Trade and Commerce.... In the trial of Mc. Quade, one of the "boodle" Aldermen of this city, the jury after being "out" for over 48 hours, failed to agree—nine for acquittal, three for conviction; only one of them resolutely. They couldn't believe the evidence of Fallgraff and Duffy the two "squealing" aldermen—a lamentable miscarriage of justice and a strong impeachment of the present jury system.....Both houses of the Vermont Legislature have passed a railroad commission bill, with only one dissenting vote. Its provisions are moderate; but stringent enough to meet gross railroad abuses.....Three Commissioners at $8 a day and $5 a day for clerk, when engaged on duty, with necessary expenses—all expenses not to exceed $5,000 a year.....Steve Dorsey is growing rich by attending to his ranch, and keeping out of politics. ....In regard to the Standard Oil Company's acquisition of the Richmond Terminal Company, which owns the Richmond and Danville systems of railways, it is stated that the charter of the Terminal Company allows the company to acquire railways in a dozen States, to consolidate with other roads and to change its name. It differs from other railway charters in Virginia in that it permits the acquisition of roads with which it does not directly connect, and which means that the Standard Oil Company may consolidate as many parallel railways as shall be necessary to make its grip upon the commerce of a dozen States absolutely sure. .....A conspiracy has been discovered in Buffalo, N. Y., between several prominent members of the Board of Trade and the manager of the Richmond Elevator, to steal grain by the boat load, to be sold in this city or elsewhere, the manager to get two-thirds of the profits; 10,000 bushels are supposed to have been stolen: guilty parties arrested; manager turned State's evidence; others released on $2,500 bail.....The Canadian government is anxious that Esquimalt, the naval station on the Pacific, should be immediately fortified in view of a possible Russian attack.....President Arthur left about $100,000 in real estate and as much more in personal property. All goes to his son and daughter to whom considerable legacies were left some time ago by their maternal grandmother.....The election of several Knights of Labor to the Georgia Legislature may indirectly lead to the abolition of the convict camp system. A bill is to be introduced into the next Legislature limiting or abolishing the convict lease system. As conducted now the convict camps are an outrage to humanity and a disgrace to the State.....It is said that the Civil Service Commissioners propose to hold four examinations for government appointments annually in interior cities and towns in the various States, so that the people in the rural districts may have the same advantage in competitive examinations as the inhabitants of the larger cities..... ....Three thousand five hundred and eighty national banks have organized in all, of which 2,858 are now in operation; of these 174 have been organized during the past year, with a capital of $21,000,000 in bonds.....Early in the week forest fires were burning for 50 miles along the Wilmington and Weldon Railroad, Va. Damage to timber lands "enormous." .....Through opposition of the Knights of Labor the miners in the Pennsylvania coke regions have decided not to strike. .....After all Colonel Robert G. Ingersoll has been retained for the condemned Chicago Anarchists, and will argue their case before the Supreme Court in March.....Birmingham, Ala., is booming with the news that $3,000,000 have been put into the purchase of the Sloss coal and iron property, which means two and possibly more new furnaces built with Eastern money....The freight conductors and brakemen of the Cleveland and Pittsburg Railroad have been advanced 15 to 30 cents per day, and the impending trouble thus averted,. ....President Cleveland has appointed Assistant Medical Purveyor John Moore as Surgeon-General of the Army. An Indiana man; entered the army as surgeon in 1853; served in Florida and with the Utah expedition in '57, and in the late war.....The leaders of the labor party in Chicago are bragging that they will control the next Illinois Legislature and elect their own Speaker.....The valuation of property in Alabama has grown from $135,535,792 in 1876 to about $175,000,000. There is a balance of over $340,000 in the treasury.....The grand jury at Chicago last week ignored the bill against the Pinkerton men charged by the coroner's jury with complicity in the death of Terence Begley near the Union stock-yards after the recent strike... ....The Canadians propose to prevent Portland, Me., from becoming the winter port of the Canadian Pacific Railway by running the proposed line of steamers to Montreal. The river freezes over at Montreal every Winter, but dynamite and steamships are to be relied upon to keep a passage open.....It is said to have cost the Dominion Government $6,000 a week to maintain these fishing cruisers during the past season ....Commissioner Peck, of the Bureau of Labor Statistics of this State, says that in consequence of American boys being disinclined to learn trades all the good places are filled with foreigners, and the immigration of mechanics to this country is thereby stimulated.....The Welland Canal will close for the season on Dec. 1.....The Delaware and Raritan Canal will be closed on Dec. 20. ....Sir John Macdonald has given orders that no vessel shall be allowed to pass through the Welland Canal on Sunday, except in case of distress or where there is danger of the vessel's being frozen in.....The N. Y. Capitol at Albany is heavily draped in memory of the late President Arthur, but there is no money to pay for the crape, and the mourning drapery for Grant and Hendricks has not yet been paid for. ..It is customary for the Governor of Massachusetts to pardon some one from State prison on each Thanksgiving Day, and this year the lucky prisinor was Daniel J. Dwight, who was serving a life sentence for murder in the second degree. He had served 10 years and six months..... ....Henry M. Stanley, the famous African explorer, arrived here yesterday.....For the first time in many weeks the Committee of the Grant Monument Fund Association will meet on Thursday next, and strong efforts to revive interest in the fund will be made. The fund is now nearly $124.00.....A telegram from Little Rock this morning says gold has been discovered in abundance in several of the streams of Oklahoma, Indian Territory, and the excitement is great and increasing in Arkansas, Kansas and Texas. Over 300 claims have been already staked out, and it is expected there will be a regular rush to the country within the next six weeks despite the efforts of the United States troops to keep all intruders out.... The cigar manufacturers in Havana have again suspended work, owing to new demands on the part of the operatives. .....O'Donovan Rossa is no longer head of the dynamite fiends. He is going to try to make some money honestly. His successor's name has not yet been made public..... Mr. Garland wants Arkansas to vindicate him by returning him to the Senate when Mr. Berry's term closes..... ....

AGRICULTURAL NEWS.

SATURDAY, November 27, 1886.

THE present cotton crop of Arkansas is the best ever raised there. It is estimated that the yield will reach 750,000 bales against 600,000 in 1885.... ....The Indian Department has concluded to locate the Comanches, the Cheyennes, the Araphoes, the Kenawees and the Wichitas, east of the ninety-eighth degree of longitude, which embraces Oklahoma. This will settle the question in the negative as to that part of the country being open to white settlement.....A special from Fargo, Dakota, says: The wheat crop of the Red River Valley proves to be larger than the estimates. The elevators and warehouses along the line of the Manitoba road are full to overflowing, and in some of the towns the farmers pile the sacks out-of-doors, as the railroad is unable to furnish cars fast enough to haul the wheat to market. The Manitoba road has 4,000 cars, but many of them are tied up at Duluth owing to the lack of facilities there to handle the grain. The railroads say the movement of grain from the Red River Valley is unprecedented.....The London City Companies have resolved to sell their lands in the North of Ireland on easy terms to the tenants. The Salters' Company will transfer 250,000 acres at the purchase price, £20,000, under the terms of the Ashbourne act. The Fishmongers' Company will transfer 20,500 acres at a yearly rental of £9,500. They offer to sell to the tenants at 20 years' purchase on the Government valuation, the tenants paying annually 30 per cent. under the present rental. The Drapers' Company offers 27,025 acres at a yearly rental of £12,500 at eighteen years' purchase. The tenants accept the offers. The transfer covers nearly the whole of the County of Londonderry..... The California wine-growers have, through the State Board, commissioned an agent to represent them before Congress at the coming session, in order to procure protective legislation. They declare themselves not in favor of the passage by Congress of any measure extending to grain spirits freedom of taxation when used in fortifying wines. The product of the State in wine is variously estimated this year at from 15,000,000 to 18,000,000 gallons, considerable of which, more than usual, owing to the failure of Congress to complete the legislation relating to sweet wines, is being distilled..... ...The United States Agricultural Dept. announces that the experiment of making sugar by the diffusion process in Kansas has proved so satisfactory that next season a diffusion apparatus will be set up in Louisiana. In the matter of sorghum cane further experiments will be necessary to achieve full success by the process .....The Hawaiian Commercial Company of San Francisco reports that the acreage of cane for next year will produce 13,680 tons if the yield is the same as last year, but for safety it is estimated at 11,000 tons..... ....The Australian wool market seems to be just now the worst in the world... .. .Large consignments of sheep for breeding purposes are being shipped from Cumberland, England, to Buenos Ayres, South America.....The Northwestern wheat crop is pouring into Duluth, Minneapolis and St. Paul with astonishing rapidity, increasing the "visible supply" to an extent that has a depressing effect on prices.. ....The present old stock of colonial wool in London amounts to 7,000 bales, against 78,000 bales this time a year ago. The new series of sales begins on Tuesday and prospects are growing brighter. It is charged that English buyers combined at the opening of the Melbourne sales to depress price.....Reports from the Rio Platte are that the new clip will be short in volume and a weak staple.....Best American steers weak in Liverpool at 11½ cents estimated dressed weight. Exports of live stock and dressed beef from Boston during the week were small—254 cattle and 3,892 quarters of beef.....A total of 21,431 hogs were shipped from Chicago last Saturday week—the heaviest on record.....It is estimated that branding inflicts $4,000,000 worth of damage annually upon the cattle of this country..... ....Richard Swigert, of Lexington, Ky., has purchased in England, by cable, the celebrated stallion Kingcraft, winner of the Derby in 1870, for $17,500. He is by King Tom out of Wooderaft.....Henry Bergh says when he first began the Society for the Prevention of Cruelty to Animals movement the only gifts he received came in $1 or $5 lots. Later on $100 checks began to take his breath, but now immense fortunes float around his way. ....The export of wheat in October reached a total of 30,753,000 bushels, against an average in eight years of 32,537,250 bushels in the same month. The volume was larger than in any October since 1882. The years 1879, 1880, and 1882 were respectively 61,832,000 bushels, 40,897,000 bushels and 36,132,000 bushels. In the other years the total was below that of last month..... Oliver Dalrymple, of Dakota, states that he will put in 31,000 acres of crops next season.....For the year ending October 31, we exported 820,036,420 pounds of hog products against 794,257,014 pounds in the preceding year..... Fifty thousand tons of soot are taken from London chimneys in a year. It is estimated to be worth $200,000, and is used as a fertilizer, half a ton to an acre....

Coughs.

"*Brown's Bronchial Troches*" are used with advantage to alleviate Coughs, Sore Throat, Hoarseness and Bronchial Affections. *Sold only in boxes.—Adv.*

Crops & Markets.

SATURDAY, November 27, 1886.

THE Mark Lane Express, in its review of the British grain trade for the past week, says: Wheat deliveries have continued very restricted. In London trade is slow at an advance of 9d. per quarter (2¼ cents per bushel). In the provincial markets values are very firm and slightly above the current rates in London. The sales of English wheat during the week were 48,464 quarters at 31s. 4d. against 58,097 quarters at 30s. 10d. during the corresponding period last year. Flour is steady. Barley is inactive. Trade in foreign wheat is hardening. Quotations are irregular and tending toward an advance. Heavy arrivals of foreign oats caused a fall in values of 3d. to 4d. Beans are 1s. dearer. Eight cargoes of wheat arrived: two were withdrawn and five remained, four of which were California and one Oregon. To-day there was an increased inquiry for wheat; 1s. advance was asked on Indian, American and Russian. Flour and corn were each 6d. dearer. Barley was quiet. There were further large arrivals of oats, and prices were 3d. lower.

Latest advices from Australia report the prospect of the wheat crop as being exceptionally favorable, but the harvest is expected to be later than usual. The export of wheat from January 1 to November 1, 1886, has been only 400,000 bushels, against 8,456,000 bushels for the corresponding period in 1885. The official returns of the Russian wheat exports

for the seven months ended August 1, show that the exports were only 21,824,000 bushels, against 51,751,040 bushels during the corresponding period of 1885. This is taken as proof of the heavy deficiency of last year, and the present year's yield is believed to be very little better. American, Indian and Russian wheats at London, on Monday, were held for three cents advance per bushel, while flour was also 6d. higher. According to the journal of the Royal Agricultural Society of England, just published, 350 replies from 350 counties in England and Wales show that the unremunerative prices obtained for wheat, due to foreign competition, has caused "a large decrease in the area of wheat" and a corresponding increase in the area of grazing lands.

A report of the Ontario Bureau of Industries shows that the wheat yield of the Province of Onntario for the past season was 3,500,000 bushels less than the average of the past five years; barley, 50,000 bushels less; oats, 3,500,000 bushels more; peas, 3,000,000 bushels more, and corn 1,000,000 bushels less.

The estimate as made by the principal canners of vegetables of the tomato pack of New Jersey shows that it will exceed the heavy pack of 1884. The number of cases packed is 600,000; each case contains two dozen cans; this makes the pack of 1886 represented by 13,400,000 cans. Tomatoes were unusually plentiful this year.

Chicago statement of the visible supply of grain November 20: Wheat, 59,562,000 bushels; corn, 12,281,000 bushels; oats, 5,646,000 bushels; rye, 405,000 bushels; barley, 2,680,000 bushels. Compared with one week ago these figures show an increase of 1,253,000 bushels of wheat and 82,000 bushels of barley, and a decrease of 826,000 bushels of corn, 187,000 bushels of oats and 42,000 bushels of rye.

New York statement of the visible supply of grain November 20: Wheat, 59,551,351 bushels; increase, 1,228,803 bushels; corn, 12,289,408 bushels; decrease, 808,305 bushels; oats, 5,650,746 bushels; increase, 1,146 bushels; rye, 409,625 bushels; decrease, 50,106 bushels.

At home there has been a slight decline in the receipts of wheat at collecting points as compared with late weeks. This has been partly due to the close of canal and river navigation in some parts of the North. The export movement continues good, and is likely to take from the country about 13,000,000 bushels of wheat (and flour as wheat) during November. Russian and Indian exports are unusually small. The stocks of wheat and flour in the United Kingdom in November are reported to have been 40 per cent. less than at the same time last year. It is thought that the French demands will be greater than officially estimated. Wheat ought to go up; but then our "visible supply" is 8,000,000 bushels greater than a year ago, and grain is still being rushed to market.

Indian corn has been dull but steady. The speculative interest has not been conspicuous. The visible supply showed a decrease of 807,300 bushels, which naturally tended to stiffen the views of holders.

At the chief Western packing points receipts of hogs have been heavier, and prices thereof have been somewhat depressed. This tended to prevent operations in pork products looking to a higher range of prices.

In the wool market, while quotations are nominally about the same as for the last month, still concessions are made to large buyers. All hands are waiting for the opening of next season's goods. Business light and unsatisfactory at Boston. The sales of the week amounted to 2,210,000 pounds as compared with 2,560,000 pounds last week, and 3,720,000 in the corresponding week last year. The Philidelphia market has ruled very quiet, with sales aggregating only 450,000 pounds for the week, as against 965,000 for the same week last year. Operators are holding off for the results of the London auctions, and bids for good-sized lines are scarce, and when made are generally one cent under current asking prices. Holders, however, are uniformly firm in their views, and refuse to stimulate business at the expense of prices. The belief is general that an improvement in trade will follow the opening of the colonial sales in London.

Farms on James River, Va., for ten dollars a month. Send for illustrated circulars and maps. J. F. Mancha, Claremont, Va.—*Adv.*

Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
in my Remedy, I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.
"It has stopped the hogs dying and improved their appetite."—F. P. GOLDSBOROUGH, Easton, Md.
"Have used the remedy with success."—D. G. BARBER, Easton, Md.
This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.
"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIN, Grant City, Mo.
"We would not risk feeding a pen of hogs without the remedy."—WHITE & CO., Gibsonton, Pa.
"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.
"It gives satisfaction every time."—J. G. BARTLETT & SON, Sunapee, N. H.
"It has never failed to arrest the disease yet."—JONES & MUSSELMAN, St Paris, O.
"I have sold over $2,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.
The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.
Prices, **$2.50, $1.25,** and **50 cents** per package. 25 pound cans, **$12.50.**

For the Young.

THE STORY OF A DISTRICT SCHOOL.

A COLLEGE BOY'S DIARY.

(Continued.)

On the Monday following the funeral I found the school in a state of considerable excitement. Mollie Brawn made haste to state the cause. She danced up and down before my desk as she shouted: "Jack's a comin' to-day—aint I glad! Aint I glad!"

This announcement spoiled my morning. I must confess that I was a little afraid of Jack Brawn. I knew that I could master the other scholars and teach a good school if he kept away. I could see that the notion of his coming put a spirit of rebellion into the other boys. All they lacked was a bold leader to induce them to break out. No wonder I looked nervous when at last we heard Jack stamping the snow off his feet on the ontside of the door. He looked larger than ever to me as he strode in and hung his hat on a nail. He gave me a sour look and nodded. He carried his books under his arm, and made his way to a seat at the back of the room.

I concluded to go on with the school just as though nothing had happened, so I went on trying to show the difference between A and B to a very stupid little boy who held the floor when Jack came in. At the same time I kept an eye on the new comer. I had fully made up my mind, in case of any trouble to settle it once and for all. Either I should be master of the school or leave it. In glancing about for a weapon, I noticed one of the sticks that the director had brought in standing in the corner. It was a large, heavy looking cudgel with a good-sized knot at the end. I made up my mind that when the fight did come it should be near that stick.

Jack behaved himself well enough for a time. He got up and came out with one of the classes to recite. He knew very little about the lesson, and I found that I should be forced to put him back into a class of smaller scholars. His black eyes snapped as I told him this, and we should have had the long looked for insurrection right there had it not been for our visitor.

A sharp rap came at the door and I dismissed the class as I walked over to see who had called. A tall man wearing a soldier's blue overcoat stood on the steps. He nodded at me, and as a first step towards eloquence, took from his mouth a large piece of tobacco which he held in his hand all ready for further use. It was a little cold, and the door opened directly upon the steps, so I invited the stranger in. He came walking heavily in, took off his hat with his tobacco hand and proceeded to explain the object of his visit.

"Like enough you folks know me," he said, "bein's I'm sorter interested in schools like. I'm the director over ter deestrict No. 3. I'm a great hand ter good schools, I be. I 'low we've got the best teacher in this township over ter my deestrict, an' I picked him out. He kin figger all through the 'rithmetic in his head, an' when it comes ter spellin'—my, ef he ain't a hoss, I'm a mule. An' that sorter ties me up ter what I started fer ter say. Our folks 'lows we kin beat the township to a spellin' school, so we laid out ter come over here a Friday night an' git up an appetite on this deestrict. We're spellers, we be, an' don't you never fergit it."

The scholars received this intelligence with all the enthusiasm that Bear Creek was capable of. That is, they looked at each other and winked their dull eyes and nodded their heads. The bearer of the challenge, put his hat on his head and started for the door. Of a sudden he appeared to remember that as a school official, he ought to speak a few words of advice and cheer. So without removing his hat, and with the tobacco still in his hand he went on.

"I'm allus glad ter visit schools an' put in a word where it'll do some good. Schools is the greatest thing in this country. All the big men that do all them things you read about in the readin' books, went ter school. An' they done good work while they wuz there. Schools is changed from what they was in my younger days. I kin remember the fust time I went ter school. I set on a log an' larnt my spellin' lesson betwixt two boys that fit the teacher every day. We had a great big feller fer a teacher that carried a bottle of hair ile in his coat-tail pocket. Them big boys got me ter hit that bottle with a stick. I done it an' bruck the bottle. Then them boys gut scared an' made me take all the thrashin'. All them things shows how much better off you be, an' how fast ye orter larn. We'll be over a Friday an' make things bile."

He went out at last and shut the door behind him with a bang. Before he had fairly left the building the scholars grasped their spelling books to prepare for the struggle. Bear Creek might be lacking at some points, but she meant business when her spelling was assailed. I quickly found that it was customary, on such occasions, to spend the whole week over the spelling book and to neglect entirely the other duties. Even Jack Brawn's face lost its scowl as he plunged among the long words.

At the noon recess some of the larger girls came to my desk and after much giggling said they wanted to get up some singing for the spelling match. They wanted me to sing with them. I never was a musician and am lucky enough to realize the fact, but of course I told them I would do my best to aid them. So the girls secured an old singing book, and ranged back of my desk to practice. The boys formed a group by the door and watched us. The girls picked out "Murmuring Sea" for the first piece. I do not know what there was appropriate about it, but music is music, and we started bravely in. As I stated, I never pretended to be a singer, but I was not prepared for the roar of laughter that went up from the boys as I started.

"Give that calf more rope," shouted a voice that I recognized as Jack Brawn's.

I dropped the book and started to my feet. I decided in an instant to fight the battle of Bear Creek right there.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I guess you think I am slow about letting you know how the seeds you sent us came out. We planted the Garden Treasures, but they did not come up very well, but the Alaska Peas came up and were very fine. I am a girl 11 years old, and have two sisters and three brothers. We live on a farm and have four cows, two horses and a nice little colt. We raise pigs, chickens, turkeys and ducks. My Papa takes the RURAL and likes it very much. Please don't put this letter in the waste basket. I have a little brother six years old who went out to-day with his dog and caught a rabbit. If you have any little boys up that way who can beat that let us hear from you.

From your niece, ALICE H. NIELDS.

Nottingham.

[We haven't heard of them. He will make a mighty hunter some day. How much of the catching did the dog do?—U. M.]

DEAR UNCLE MARK: I would like to join the Y. H. C. The seeds that you sent to Papa were doing nicely when the frost killed them. I have one sister nine years old. We have two horses, one colt, three cows, two calves, three sheep, 100 chickens, one dog, six cats and eight birds. I like to read the Cousins' letters I will close now. Your nephew,

MARION PUFFER.

DEAR UNCLE MARK: I read the Cousins' letters and would like to be a Cousin, too. Maybe the Cousins would like to hear about my misfortune. August 21, 1885 my right knee began to hurt. I went over to my Aunt's to visit; I was going to stay a week, but it hurt me so badly I had to be brought home. Mamma and one of my brothers took me up to the doctors, who thought at first it was inflammatory rheumatism, but it was not, and afterwards they thought it was an abscess. The doctors thought it could not be cured, so they thought it would have to be amputated. The little piece that was left healed up in six weeks and on February 11 I commenced walking on crutches. I go to school most every day; I was 11 years old May 5. I didn't go to school then because it was so muddy and such busy times that I couldn't be taken up to the schoolhouse. The girls made up a surprise party and invited all the scholars that were big enough to come. We had a lap supper and had a nice time, only it rained. Papa always takes me up to school when he is here, but he is visiting in New York, now. My oldest sister takes me up in the buggy and my youngest sister goes with us for a ride. I have two sisters younger and three brothers and two sisters older. The next one to the youngest goes to school with me. The school-house is three-quarters of a mile from our house; we live on a farm of 160 acres of land. We have very bad weather now, windy and dusty.

LILLIE MAY SMITH.

York, York Co., Neb.

[I guess you are a pretty brave little girl. We are all sorry for you. Wouldn't it be fine if we could all come and give you a surprise party? You must not be discouraged at all. I am very glad you can have such good times as you do. Uncle Mark would like to see you.—U. M.]

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

Rheumatism

We doubt if there is, or can be, a specific remedy for rheumatism; but thousands who have suffered its pains have been greatly benefited by Hood's Sarsaparilla. If you have failed to find relief, try this great remedy. It corrects the acidity of the blood which is the cause of the disease, and builds up the whole system.

"I was afflicted with rheumatism twenty years. Previous to 1883 I found no relief, but grew worse, until I was almost helpless. Hood's Sarsaparilla did me more good than all the other medicine I ever had." H. T. BALTON, Shirley Village, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

Brewster's Patent Rein Holder.

Your lines are where you put them—not under horses' feet. One agent sold 12 doz. in five days; one dealer sold six doz. in 15 days. Samples worth $1.50 FREE. Write for terms.

PERSONALS.

MR. LABOUCHERE is the greatest smoker in Parliament, and wants everybody to smoke everywhere.

JOHN BRIGHT says that England can never return to protection till the United States restore slavery.

SIR ROBERT HAMILTON, Under Secretary of Ireland for so many years, who has been forced to resign, by the Conservatives, on account of his Home-Rule sentiments, is to be Governor of Tasmania, at a salary of $25,000 a year—double his old salary.

THE President has declined to reinstate Republican William A. Stone as Attorney-General of the Western district of Pennsylvania. Democratic Benton, of Missouri, removed at the same time on the same grounds, has been reinstated. One spoke against and the other for the Administration.

MR. HOLT, Lincoln's Judge Advocate-General, still lives at Washington. He is white-haired and bent with age, but his eyes are as bright and his mind as active as ever. He lives much alone, drives out a great deal, and reads the classics. There is no truth in the story that he is a remorseful misanthrope.

THE Senatorial contest in Nebraska is largely Van Wyck and anti-Van Wyck. The Senator counts friends in both parties, and claims 45 Republican and 24 Democratic votes. The anti-Van Wyck Republicans outnumber the Van Wyck Republicans, but it is the avowed purpose of the Senator's adherents not to go into caucus, but to make the fight in open convention, and elect him by a union of Republican and Democratic Van Wyckers.

GEN. BULLER, an energetic English officer, who was sent over to the west of Ireland some months ago to repress agrarian outrages, help evictions and aid the landlords, has become convinced that Home Rule and a change of policy with regard to the land question are essential for Ireland, and now the landlord or extreme Conservative party are plotting to secure his removal, while the Land League and Home Rulers who denounced his appointment, are now vigorously protesting against the machinations of his opponents

PRINCESS BEATRICE, wife of Prince Henry of Battenburg and youngest daughter of Queen Victoria, has given birth to a son. Both the mother and son are doing well. Lord Randolph Churchill was the Minister in attendance at the accouchment. A great scare was caused throughout the west end of London, Tuesday afternoon, by the firing of cannon in St. James' Park, to celebrate the queen's new grandchild. A dense fog was prevailing at the time, and for a while the detonations were believed to be those of some dynamite attack.

SCENE at Arthur's funeral. Edmunds in the library. Blaine pauses a moment at the door on his way to view the body in the second floor front. "There's hardly any use to introduce you two gentlemen," says Col. McMichael. The Vermonter advances with genial face and outstretched hand. "Oh no," says he. "Oh, no; not at all," says Blaine, turning his back and walking rapidly away. Blaine, after a glance at the body, left the house unattended without seeing President Cleveland, Ex-President Hayes or the other notables present. A letter of Edmund's to a friend, published the other day, but written April 1885, saying that as an honest man he couldn't speak in favor of Blaine for President, was the immediate cause of the snub.

CHARLES FRANCES ADAMS, Sr., died of old age at his house on Mount Vernon Street, Boston, at two o'clock last Sunday morning. Grandson of the second President of the United States and son of the sixth, he was born at Boston Sept. 13, 1807. Father, John Quincy Adams, made Minister to Russia in 1809, took child with his mother to St. Petersburg. When his father was made Minister to England in 1815, his family went with him, and returned with him to America in 1817. C. F. A. graduated at Harvard in 1825, the year his father entered the White House; called to the bar at Boston in 1827. When 22 years old married Abigail Brooks, daughter of a wealthy Bostonian. He has been a member of the State Legislature, editor of the Boston Whig, one of the first Republican papers in the country; candidate for Vice-President on the Van Buren ticket, when Taylor was elected in 1848; Congressman in 1858; Minister to England from 1861 to 1868. U. S. Arbitrator in the Alabama Claims Commission in 1871.

CONSUMPTION.
I have a positive remedy for the above disease; by its use thousands of cases of the worst kind and of long standing have been cured. Indeed, so strong is my faith in its efficacy that I will send TWO BOTTLES FREE, together with a VALUABLE TREATISE on this disease, to any sufferer. Give express & P. O. address. DR. T. A. SLOCUM, 181 Pearl St. N. Y

WE WANT YOU! a live energetic man or woman needing profitable employment to represent us in every county. Salary $75 per month and expenses, or a large commission on sales if preferred. Goods staple. Every one buys. Outfit and particulars Free. STANDARD SILVERWARE CO., BOSTON, MASS.

NEW Sample Book of beautiful cards, 11 Games, 12 tricks in magic, 436 Album verses. All for a 2c. stamp. STAR CARD CO., Station 15, Ohio.

FRINK'S RUPTURE REMEDY
Will quickly cure any case of Hernia or Rupture. Explanation and testimonials free. Address
O. FRINK, 24 BROADWAY, NEW YORK.

DEAFNESS Its causes, and a new and successful CURE at your own home, by one who was deaf twenty-eight years. Treated by most of the noted specialists without benefit. *Cured himself* in three months, and since then hundreds of others. Full particulars sent on application T. S. PAGE.
No. 41 West 31st St., New York City.

RUPTURE
Have you heard of the astounding reduction for DR. J. A. SHERMAN'S Famous Home Treatment, the only known guarantee comfort and cure without operation or hindrance from labor? No steel or iron hands. Perfect retention night and day, no chafing, suited to all ages. Now $10 only. Send for circular of measurements, instructions and proofs. Get cured at home and be happy, office 294 Broadway, New York.

I CURE FITS!
When I say cure I do not mean merely to stop them for a time and then have them return again, I mean a radical cure. I have made the disease of FITS, EPILEPSY or FALLING SICKNESS a life-long study. I warrant my remedy to cure the worst cases. Because others have failed is no reason for not now receiving a cure. Send at once for a treatise and a Free Bottle of my infallible remedy. Give Express and Post Office. It costs you nothing for a trial, and I will cure you.
Address Dr. H. G. ROOT, 183 Pearl St., New York.

HOLSTEIN-FRIESIANS.
STOP! THINK! INVESTIGATE!
Lakeside Stock Farm has
The only Cow that has given 25,021 lbs. 2 oz. of milk in a year
The only four-year-old that has given over 23,000 lbs. in a year.
The only two-year-old that has given 18,484 lbs. 13 oz in a year.
The only herd of mature Cows that has averaged 17,166 lbs. 1 oz. in a year.
The only herd of two-year-olds that has averaged 12,409 lbs. 8 oz. in a year.
The only two-year old that has made 16 lbs. 9 oz. of butter in a week.
The only herd in which 37 two-year-olds have averaged over 11 lbs. each in a week.
Twenty-three Cows in this herd have averaged 18 lbs. 3 oz. of butter in a week.
Also a fine stud of CLYDESDALE STALLIONS, Mares and Fillies of all ages.

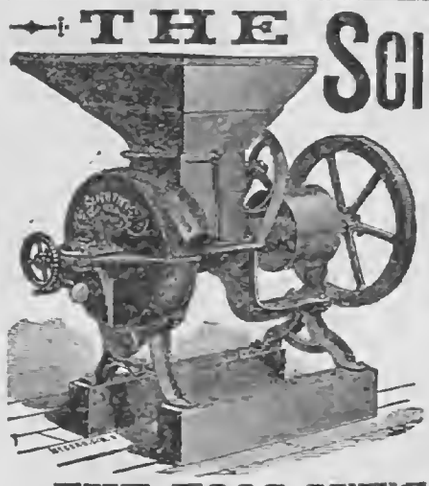
THE SCIENTIFIC GRINDING MILL



THE BEST MILL ON EARTH.
For grinding Ear Corn, Shelled Corn, Oats, and all small Grain. Grinding Plates. A Special Metal hard as Steel. Have Double Capacity, as they **Sharpen Themselves** on being reversed, which is done by simply **Running Mill in Opposite Direction.** Provided with a **Pin Breaker,** which prevents damage should iron accidentally go into the Mill. Sent on trial to responsible parties, and each Mill fully guaranteed. **Send for Illustrated Catalogue.**
THE FOOS M'F'G CO., SPRINGFIELD, OHIO.

THE BEST

WASHER
We will guarantee the "LOVELL WASHER" to do better work and do it easier and in less time than any other machine in the world. Warranted five years, and if it don't wash the clothes clean without rubbing, we will refund the money.
AGENTS WANTED in every county. We CAN SHOW PROOF that Agents are making from $75 to $150 per month. Farmers make $20 to $30 during the winter. Ladies have great success selling this Washer. Retail price only $5. Sample to those desiring an agency $2. Also the Celebrated KEYSTONE WRINGERS at manufacturers' lowest price. We invite the strictest investigation. Send your address on a postal card for further particulars.
LOVELL WASHER CO., ERIE, PA.

ONE VOTE
at the polls determined the United States Senatorship in New Jersey. Just $1 50 will secure you the AMERICAN AGRICULTURIST for 1887, which for half a century has been the recognized leading periodical of its character, and now contains far more illustrations, is larger in every way and better than ever. Postmasters! form Clubs.
The JUVENILE, HEARTH and HOUSEHOLD DEPARTMENTS have been enlarged, and HUMBUG Exposures are to receive additional attention.
1000 ORIGINAL ILLUSTRATIONS.—Every issue of the AMERICAN AGRICULTURIST contains nearly 100 original illustrations of animals, plants, new farm and household conveniences and appliances, out-door scenes, etc.
SPLENDID ENGRAVINGS FREE
HOMES OF OUR FARMER PRESIDENTS.—It is noteworthy that a majority of our Presidents were reared on farms, or retired from public life to rural scenes. The AMERICAN AGRICULTURIST is now publishing and **sending free** to all subscribers, at an outlay of **$30,000,** superb Engravings (8 by 21 inches in size) of these Homes, together with special descriptive papers by James Parton, Donald G. Mitchell and other eminent living American authors. These Engravings constitute a magnificent portfolio collection of ornaments
FOR THE
walls of a prince or peasant's home. Subscriptions for 1887 immediately forwarded are entitled to all the series, beginning in May last.
ENDORSED BY THE U. S. GOVERNMENT.—Vol. 8th, Tenth Census, says, "The AMERICAN AGRICULTURIST is especially worthy of mention, because of the remarkable success that has attended the unique and untiring efforts of its proprietors to increase and extend its circulation. Its contents are duplicated every month for a German edition, which also circulates widely."
Price, $1.50 a year; Single Numbers, 15 cents.
Balance of this year FREE to all subscribing immediately.
Send Six Cents for mailing you Grand Double Number, just out, 32-page Premium List, and Sample Proof of Engravings of "Homes of our Farmer Presidents," together with Description by James Parton. Address

VOL. XLV No. 1924. NEW YORK, DECEMBER 11, 1886. PRICE FIVE CENTS. $2.0 PER YEAR.

Entered, according to Act of Congress, in the year 1886, by the RURAL NEW-YORKER, in the office of the Librarian of Congress at Washington.

Pomological.

JAPAN CHESTNUTS.

Is it a Japan Chestnut? The possibilities of improving chestnuts; a failure with Japan Chestnuts; seedlings; easy to raise.

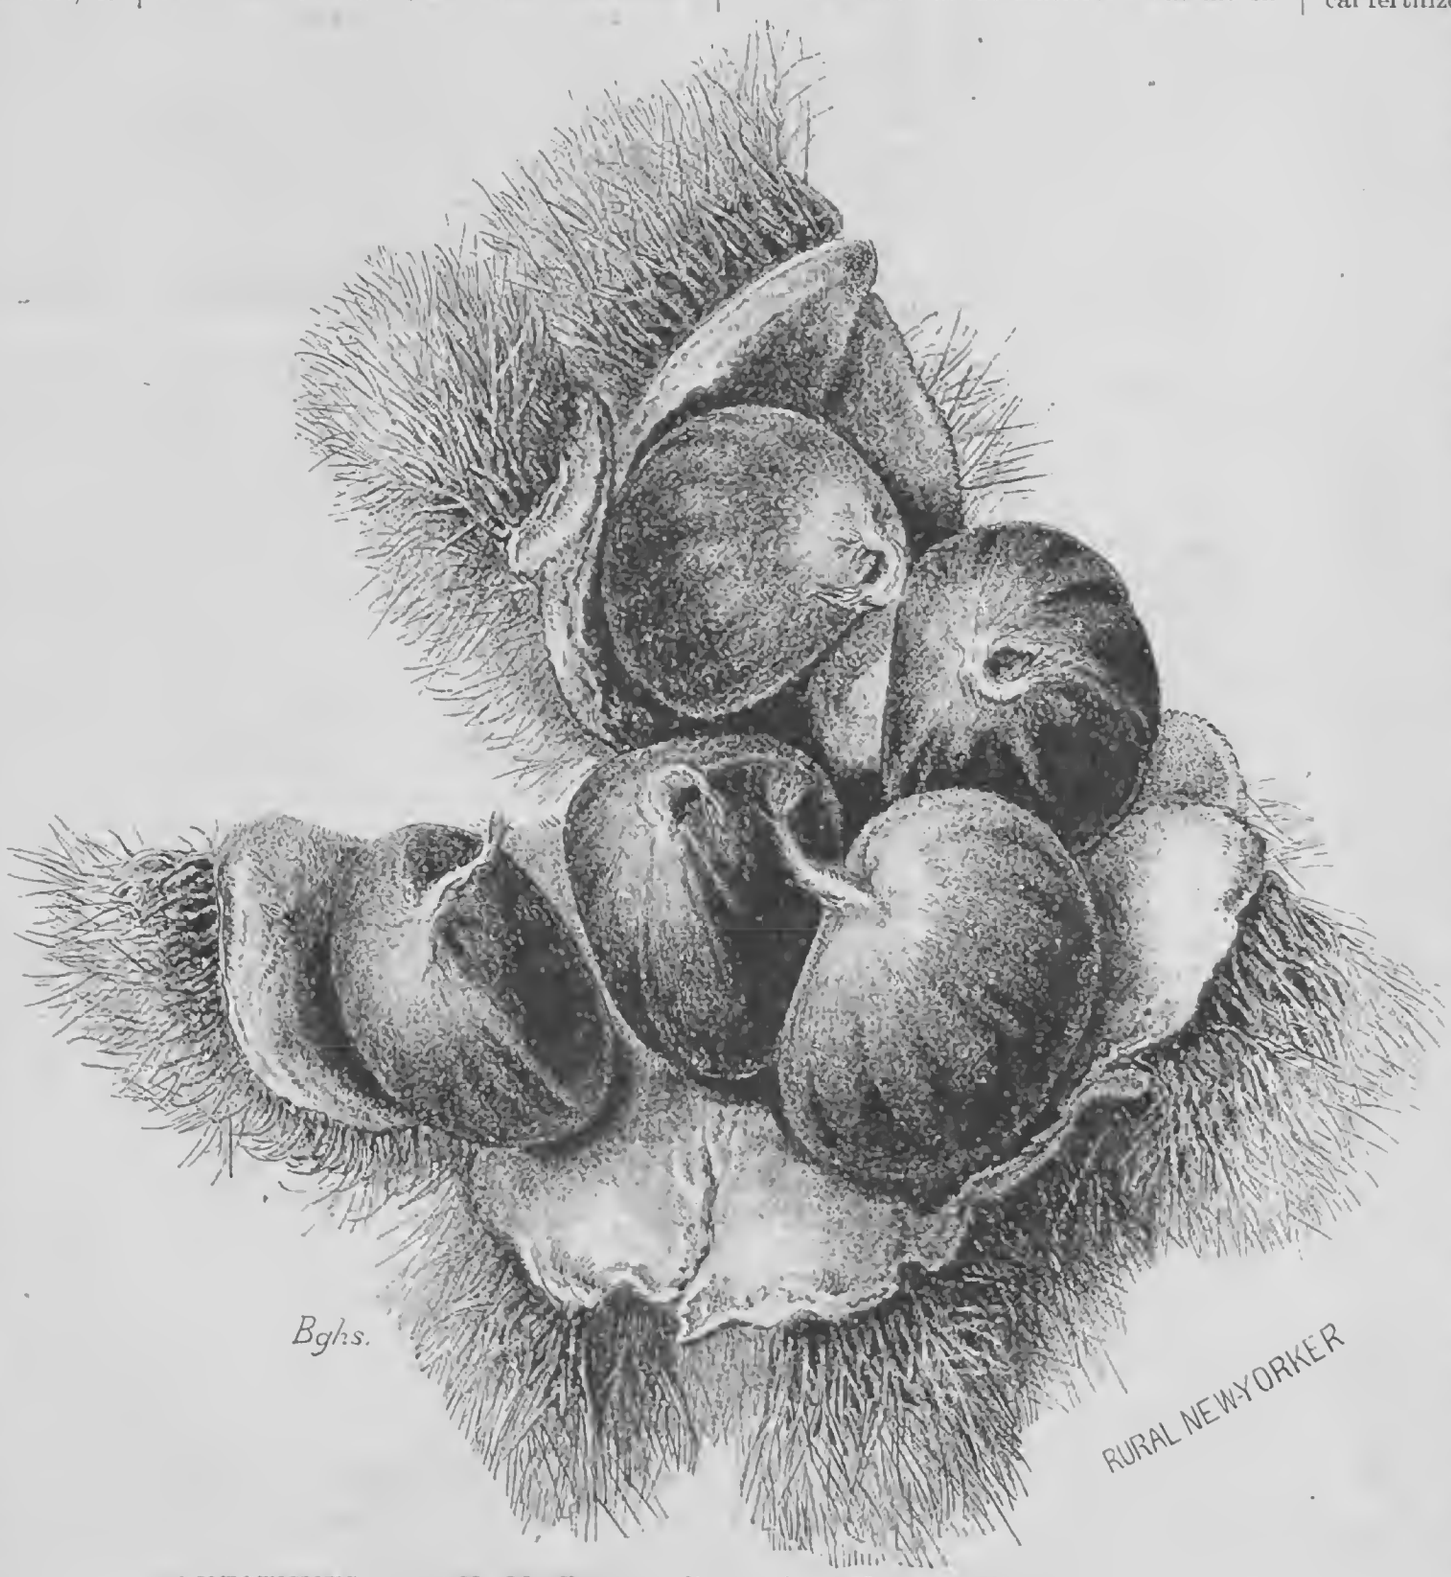
ON October 11, we received from Messrs. H. M. Engle & Son, Lancaster Co., Pa., five large chestnuts in a burr, as shown at Fig. 450. The quality was as good as that of our native chestnuts. Mr. Engle writes:

"So far as concerns productiveness, vigor, hardiness and early fruiting, this variety is all that can reasonably be desired; in fact, it bears in the nursery the second year from grafts. The specimens are fair samples of the size of the fruit. Its history I cannot trace further back than 10 or 12 years ago, when I received from an amateur a few cions bearing the name, 'Great American.' That it is a true native I have doubts; it may be from a foreign variety influenced by native pollen, since for quality it is claimed to be nearly if not altogether equal to any of the American sweet chestnuts. I expected it to be identical with 'Numbo;' but on comparing their foliage I am sure they are different. Not having the 'Numbo' in bearing yet, I can not say how it will compare with ours for productiveness, size or other qualities of fruit; but that it can possibly be superior in any respect, I can not for a moment believe. I have seen Japan chestnuts larger than these; but some fruiting in this vicinity this season are not as large. As to quality, I have had no opportunity to compare them.

"As to comparative vigor, the Japan seems small and feeble, and since its hardiness is questioned by some, it is not likely that it will prove superior to some varieties now cultivated. As to varieties, I would just here suggest that any proving superior should be authoritatively named before synonyms or a confusion of names can occur, especially since nut culture will be rapidly extended in this country, and well it should be. As the value of nuts as food for man is appreciated by only a few just now, it would be of interest to learn the nutritive properties of nuts generally, and specially of chestnuts. The appetizing quality of the latter is well known to those who have eaten them fresh, boiled or baked, and when they can be had of the size of some varieties now raised, we can make a meal without getting hungry while shelling them.

"As to Japan chestnuts, since many are grown from seed, we may soon have as many varieties as there are now of Chickasaw plums, under the name of Wild Goose."

[R. N.-Y.—The size of the chestnuts and the number in one of the burrs are shown in the illustration, Fig. 450. The quality of this variety is *fully* equal to that of the average American chestnut. We do not pretend to say whether it is American or Japan, not having seen the wood or foliage. No matter of what country it is a native, such specimens show that the size of chestnuts may be doubled without lowering the quality, and that productiveness may be greatly increased by seedling cultivation. No doubt worthless Japan seedlings will be distributed in numbers, but out of the lot of rubbish we shall in time settle upon varieties far superior to those known at present.



CHESTNUTS FROM H. M. ENGLE. Drawn from Nature. Fig. 450.

A FAILURE.

J. N. Roberts, of Norfolk Co., Mass., gives his experience with Japan Chestnuts as follows:

"Eight or 10 years ago, quite late in the season, while purchasing some pear trees of a nurseryman in Boston, my attention was attracted to a very foreign-looking package of what appeared to contain material for canes or sun-shade handles; but upon inquiry I was informed that the package contained about 100 or more young Japan Chestnut trees which had been ordered several months previous by some lover of novelties in or near Boston, but upon their arrival by express from California so late in the season, there was no one to claim and pay charges on them, and they were, therefore, placed in the hands of the aforesaid nurseryman to be disposed of as best he could. I was induced to try a couple at 25 cents each, and set them out in a favorable situation.

It being the latter part of June, I did not see any signs of new life until along in July, when the buds began to expand and new growth to assert itself in a very gratifying manner. The young shoots and leaves that during the season kept multiplying were the admiration of all who saw them. The foliage was striking, and unlike anything I had ever seen.

In the Fall I took special pains to have them well protected during the Winter, and to that end I protected them in the best possible manner with straw and matting, and left them to their fate until Spring. When spring time came, and new life was indicated by swelling buds, I carefully disrobed my new friends, expecting all the while my reward would be ample; but, alas! when I took off the last layer I found that the bark was cracked and ready to peel, leaving nothing but the bare stock, sapless and dead. Thus ended my first and last experience with the Japan Chestnut.

"Now what was the matter? Was the climate too severe, or did I kill them with kindness?

R. N.-Y.—We doubt not that they were killed owing to late growth. Possibly they were the Spanish Chestnut.

On Dec. 2 we received from Storrs, Harrison & Co., of Painesville, Ohio, three chestnuts, marked "Japan Chestnuts," which weighed four ounces, the largest we have ever seen. The flesh was coarse and inferior to that of American chestnuts. Storrs, Harrison & Co., are confident that these are Japan Chestnuts, but we have never seen any grown in this country so large or of such poor quality. They resemble the Spanish chestnuts sold from the street stands.

Field Crops.

Experiment Grounds of the Rural New-Yorker.

SELF-HUSKING, BRAZILIAN FLOUR, ANGEL OF MIDNIGHT CORN.

SELF-HUSKING CORN.—Seed received from Peter Henderson & Co., of New York. It was planted May 1st in drills one foot apart—the drills four feet apart. The soil was a sandy loam much impoverished by constant cropping for a dozen years or more Complete chemical fertilizers were sown upon the plot at the rate of about 600 pounds to the acre. The plant averaged six feet high and bore one and two ears to a stalk—generally one. The ears were about nine inches long, eight rows, very regular. They resemble the yellow Canada flint. The kernels are a trifle larger, however, and the cob very small. The crop might have been harvested August 15. The husks begin to wither while yet the plants are vigorous and green, and finally fall down around the stalk, exposing the ear fully Many kinds of flint corn and some kinds of dent have the same habit, though not, so far as we have observed, to the same degree. At any rate Mr. Henderson is the first to have utilized this peculiarity by bringing it prominently before the public for whatever it may be worth in saving labor in husking. Some may object to it on the ground that the naked ear invites the attacks of sparrows, blackbirds, etc. It was not so in this case. The kernels were well glazed before the husks began to free themselves from the ear, and the birds were unable to injure them, being closely set and hard. Aside from the self-husking habit, this corn may be regarded as early and prolific. The accompanying illustration, Fig. 451, page 923, shows one of the best ears.

* * *

THE NEW BRAZILIAN FLOUR CORN.—Seed received from Samuel Wilson, Mechanicsville, Bucks Co., Pa. Mr. Wilson says that it is largely grown in Brazil, S. A., and constitutes the principal article of food for the inhabitants. He claims that when this corn is "properly ground and bolted, it will make as good flour as that made from the best of wheat." "The flour," he continues "is much whiter than wheat flour; will rise as well and will make bread, pies, cakes, biscuits etc., equal to the best wheat flour." He further claims that this corn is very productive and will grow in almost any climate, and, owing to the unusual number of ears produced on one stalk, that it will produce as many bushels of shelled corn to the acre as any variety of field corn. He further claims that it is unusually valuable as a forage plant owing to its immense stooling properties, rapidity of growth and abundance of blades." He further claims that the Brazilian Corn is equal if not superior to the best varieties of sugar corn for boiling or roasting when green.

The seed was planted May 1st in the same way as the Self-Husking Corn, and in an adja-

cent plot. The plants grew about nine feet high. The stalks were comparatively slender, the joints closer together than usual, the leaves broad and many. Very few of the plants suckered at all, and those less than the average dent varieties. Nearly every joint formed a a set, so that there were sometimes eight or even 10 sets to a plant. The ears are small, averaging rather less than six inches and bearing a variable number of rows—usually 10. The kernels are rather small, white and starchy. Though the season was favorable, the grain did not mature and frost found the most advanced ears still milky. We cannot speak, therefore, of the flouring qualities of this corn. Several lots were gathered and boiled. The quality was rich and agreeable, but rather dry and tough. We should say that the Brazilian Flour Corn would not mature in average seasons north of Washington. We have never raised any kind of corn that bears anything like so many ears to a plant. The so-called Blount's Prolific is not to be compared to it. But the ears are not half so large. The *best* ear of the Brazilian Flour Corn weighs 4½ ounces (the grain four ounces, the cob half an ounce). An average-sized ear of large Western white dent weighs 19 ounces (the grain 14½ ounces, the cob 4½ ounces). It is safe to say that the grain of an *average* ear of the Western corn will weigh four times as much as an average ear of the Brazilian. We doubt if the latter will bear an average of four times as many ears as the former, while the time required in husking would be at least four times as great. The value of the Brazilian Corn must, therefore, rest in its flouring qualities, of which we can not judge. It may be well worthy of trial in more suitable climates. The illustrations, Figs. 452 and 453, p. 923 (from nature) show what Mr. Wilson considers an average ear.

* * *

MIDNIGHT CORN—POTATO YIELDS.—We have received four ears of Angel of Midnight Corn from Geo. W. Sherman, of Rhode Island, which weigh 2¼ pounds. The longest ear measures 13¾ inches, eight rows, 61 kernels to the row, or 488 to the ear. The shortest ear s 12½ inches long, eight rows, 53 kernels to the row or 424 in all. The ears are straight, the rows regular. Mr. Sherman writes as follows:

Angel of Midnight is the best corn for Rhode Island. I planted six acres this year and harvested 750 bushels of ears. I used 800 pounds of Bowker's Fertilizer to the acre, but no other manure. I also planted five acres of potatoes: one acre of Pearl of Savoy yielded 125 bushels; one acre of Early Rose yielded 160 bushels; one acre Burbanks 210 bushels; two acres of Rural Blush yielded 620 bushels. All these were salable, small ones not having been measured.

Horticultural.

GARDEN NOTES.

WILLIAM FALCONER.

SWEET CORN, NORTHERN PEDIGREE.—The RURAL's notice of this variety, Nov. 20th., reminds me that I too grew it last Summer. I sowed the seed in warm, rich, sandy ground, April 19th, and gathered the first mess of corn from it on July 9th. Plants some five feet high; one to two ears to a stalk; ears five to seven inches long; quality unsurpassed for excellence by any other sweet corn I ever ate. Indeed, I'd as soon eat it uncooked as cooked.

SWEET CORN, WHITE EXTRA EARLY MARBLEHEAD.—Sown April 9th, fit for use July 7th. The earliest corn I had. Plants some five feet high; ears six to eight inches long and mostly two to the stalk. An excellent corn, but not as sweet as Northern Pedigree.

FARQUHAR'S FIRST CROP SWEET CORN.—Plants of about the same size as the Marblehead, earliness the same, ears smaller, white; a capital early corn, but I should prefer the Marblehead.

SNAP BEAN, CLEVELAND'S IMPROVED VALENTINE.—I have grown this, another member of the RURAL 1887 Seed Distribution, for the last two years, and I must recommend it as being one of the finest beans grown. From the 20th of April till the first of September I sow it twice a week; if I knew of a better bean I'd use that instead. It is six to nine days, according to season of the year, earlier than the common Valentine. But it isn't the earliest bean in cultivation by any means, the little White Flageolet, so far as my acquaintance extends, holds that honor. But the Flageolet is of poor quality. In my trial ground last Summer, sown May 27th, it was fit for use July 8th. Land, warm, saudy, and rich.

HENDERSON'S EARLIEST RED VALENTINE BEAN.—This is just as early and good as Cleveland's; indeed, I don't know what is the difference between them.

FAMILY BEANS.—By this I mean beans for home use exclusively. "Nearly the whole crop can be taken at one picking." I think that is one of the poorest recommendations a family bean can have; for our own use we want a bean we can pick for to-day, to-morrow, the day after and longer; we want fresh, brittle beans every day in the week, and in order to have them we don't want to make a fresh sowing every day.

WHEN TO PICK BEANS.—I pick them as soon as they are three inches long; the moment there is the least string to them, they are too old, and all I can do with them is to root them out and feed them, plants and all, to the hogs, and in with a fresh supply. For this reason I sow twice a week the whole Summer through.

JERUSALEM ARTICHOKES.—We have better artichokes this year than ever before. We planted them last April in rows three feet apart and two feet asunder in the row, one middle-sized tuber in each hill. The land had been subsoiled or well manured, and during Summer kept cultivated and clean, so long as we could get in among them. In September and October the "vines" were 10 to 14 feet high, and all in bloom: but that didn't hurt the crop of tubers any. It was enormous. We store in a very cool pit with sandy earth among and over the tubers.

SALSIFY, SANDWICH ISLAND MAMMOTH.—Yes, it is bigger than the common one, but really the difference isn't much. In good ground it requires timely thinning; in poor ground it doesn't amount to anything. But the idea of its being as big as a fair-sized parsnip is all nonsense.

WHITE PLUME CELERY.—This was the hardest year for celery I ever knew. We usually sow our main crop in the fourth week of April and in due time pick them off, and plant them out in July or in early August after peas, beans, potatoes or cauliflowers. Last Summer we had lots of rain till after the middle of July when a drought set in that lasted till toward the end of October, just the time when celery should be growing. It was only with the watering cart we kept our celery alive. But on the 27th of October we had a good, soaking rain. Between that time and November 15th, when we bedded our celery, you could almost see it grow. And the White Plume is the very best celery I have got. I earthed it up twice, not to whiten it, for it is white enough naturally, but to make it tender. In all we grow some 10,000 heads.

LEEKS.—On November 18 I lifted and bedded my leeks for the Winter. In doing this I shorten their tops, then plant the leeks deep—to the tops of their necks—and close up against each other, in rows about five inches apart in a cold-frame. About the first of December I will throw an armful or two of dry oak leaves over the leeks in the frames, put on the sashes and let them alone for the rest of the Winter, except so far as taking out what I need is concerned. They are hardy enough only I mustn't let them get locked in by frost if I want them in Winter. In growing leeks there are some points to particularly observe: Seed over a a year old is almost good for nothing; the leeks don't go to seed the first year no matter how early you sow them; the earlier leeks are sown the bigger the plants will be, and later sowings never overtake the earlier ones. In sowing, sow broadcast or in quite close rows in a frame or outside nook as you would cabbage or celery, and when you get ready to plant, shorten tops and roots, and with a hoe draw drills four to five inches deep and plant therein.

GLOBE ARTICHOKES.—I cut the last lot Nov. 16th. They were small but plump and good, and from plants raised from seed sown in the greenhouse last Spring. This is a fancy vegetable, but it is becoming a fashionable one, not so much for fashion's sake as for taste's sake,—many people are fond of it. It is unreliably hardy. Old plants yield their first heads about the end of June; those from Spring sowings about the first of August. We reckon on them constantly between the first of July and the middle of October. A slight frost doesn't hurt them. There are many varieties. The round, sharp prickly ones are the poorest; the oval, flat-headed ones the best. You may buy what named sorts you please, you have got to select your stock after you see them flower. For fashionable dinners there is always a run on this vegetable, one head for each guest is the rule.

KALE FOR WINTER.—Now I am very fond of kale greens in Winter, they are so sweet and tender. But I can assure you it is we old fogies who ought to know better than to get caught napping the oftenest. For a long time I have been trying to get a real dwarf, hardy, early kale that will stand an American Winter: but I haven't got it yet. Last Spring I bought "true" Scotch kale from a Scotch firm in Boston, and have therefrom a nice crop of long-legged *purple* kale! Yes, I'm disgusted. I sent to London and got Veitch's Dwarf Late Curled, "a very superior and distinct variety for late use, dwarf, beautifully curled and exceedingly hardy," also Read's New Hearting, "very late, hardy, dwarf and compact growing . . . forming large, compact, crisp and well-curled heads. . . . It resists any amount of frost and wet without being injured." All was lovely and I had large plantations of kale, for every bit of land as it became vacant was filled up with kale or turnips. But on the 17th of October we had a piercing frost (4°) and a driving wind, and my half-mature English kales were half killed, and my young plantations completely killed. But of common and Siberian kales I've got enough.

NOVELTIES.—I buy almost everything that turns up year after year in the way of novelties, no matter be they flowers or vegetables. I never depend on a novelty for a crop, but take much pleasure in growing and comparing it in my trial ground. Folks talk about getting "sold" and "swindled" in novelties; but isn't it curious that it is we old fellows that have been practically engaged in this growing and experimenting business for a quarter of a century or more who buy and try the most of the novelties every year? We are only doing a little towards keeping posted in our business; we never look for a bonanza, no matter how loudly puffed the alleged novelty may be. We "take it easy," keep our tempers, and make a note of it.

A NEW FLOWER-POT has been invented by a lady in Arkansas. The pot has two walls, one within the other, the space between forming a reservoir for water. Near the bottom of the inner wall there are holes through which the water flows to moisten the earth. Water is poured in through a spout fixed to the side of the outer wall. It is said that where the water is supplied at the bottom in this way the roots of the plants are sent down deeper to find the moisture, and surface roots are not so liable to be formed.

The Vineyard.

MINER'S GRAPES.

THE Antoinette (of Miner) is a very strong grower, a healthy vine, and some seasons very productive, bearing large and handsome clusters, with bunches and berries larger than any I have ever seen of the Victoria, and in quality much the same. Indeed, all the white seedlings which Mr. Miner sent me were very much alike in flavor and quality, and were in this respect similar to most of the White Concord seedlings that I have seen. Although the Antoinette seems both hardy, healthy, and vigorous in this climate, it is variable, bearing well in some seasons, and but little in others; and from what I saw of the Victoria at River Edge, I thought it might have the same habit. The best in quality of Mr. Miner's seedlings that I have grown has been the Carlotta, though it is not as vigorous in growth; and the berries and clusters are smaller. The past season it ripened at the same time as the Francis B. Hayes, and was so much like it in every way that I could hardly see any difference. Both were really very good. None of the black seedlings of Mr. Miner's seemed to me worth perpetuating, as none of them was as good as Concords in any important particular.

G. W. C.

R. N.-N.—The Carlotta is in quality the best of the Miner's grapes tried at the Rural Grounds. It is not very prolific, however, and the vines are less vigorous than those of the Victoria.

BOGUS WINES.—A profitable business is being done in this city in the production of bogus wines. Dried fruits, such as raisins, currants, and peaches, are macerated with water to which a certain amount of sugar is added. The mixture is then fermented, and when fermentation is sufficiently advanced, it is checked by the addition of salicylic acid. The stuff is then flavored and colored to resemble various wines. It is a dangerous concoction, likely to cause sickness. Salicylic acid should never be taken into the stomach. Bogus wine, like bogus butter, needs a bush—smartly applied to the backs of the makers to drive them into the light.

Farm Topics.

PITHY PARAGRAPHS.

NEVER purchase a farm without having a search made, back to the State, to know that your title will be perfect; and be sure that there are no incumbrances.

Never accept the farm or the title, until it has been surveyed, and the corners located and permanently marked with a stone that is not common to the locality.

If the line fences are not on the exact line, have them put there at once. You cannot afford to quarrel with any one.

In building fences, take the cost and the time that they will last into consideration. A cheap fence may be too cheap. All fences are costly, and the fewer you have the better.

A stone fence only wants binding crosswise, it does not fall down lengthwise. A crooked rail should never be put in the fence near the bottom. A crooked rail, like a crooked man, makes more trouble than it is worth—better make wood of it.

Board fences are usually made with two good boards; they hold too much water and rot too quickly. Joints are often too wide, the wind has too great an effect. The best wooden fence cannot stop a mad bull. What is the use of trying to do it?

Iron posts and wire are to be the fence of the future. The quicker the farmer is prepared for it, the better.

A stone fence is a costly fence if you have to lay the stones, but if you have to take them as an incumbrance from the ground and pile them up, it pays at both ends.

Have your new house on naturally dry ground, but if this be impossible, drain it at least three feet below the bottom of the cellar wall. Do not lay the cellar wall plumb on either side. Have it broadest at the bottom, and just as wide as the sill at the top. If it is likely to freeze, put in a brick wall inside.

Do not build a home larger than you really want. A thousand dollars worth of house for other people to look at is a costly vanity. Have a good cistern and a large one, with a brick filter in it. It will pay the cost ten times over in a single year.

Have the conductor pipes come down on the inside, where they will keep open the year round. You will lose a little of the roof; to be sure, but in the Winter you can have all the water that there is. If the corners of the house are to the north and south, the sun can shine into every window, every day in the year and the house will be far more healthy.

Never live on the north side of a house in this cold climate, but on the sunny side, or the children will grow spindling, the eyes will fail at 30, and the women folks will drop into early graves.

The parlor should not have the most cheerful prospect, that is the room to be enjoyed on the inside. Let the outlook from the living-room be the most pleasant, where most of the time is spent.

The barn should be handy, far enough off so as not to be in danger if the house burns, and not to endanger the house if it burns.

One barn large enough for all, is better than several small ones. Have everything under one roof, and have it well insured.

Plant on the road side the whole length of the farm, such trees as naturally grew on the same place. Put them eight feet from the line.

Have some planted around the dwelling, and in the gullies and waste places, where nothing else can grow, and cover the country with trees. They will help the climate, and water supply.

You cannot do everything with one plow. You might as well expect to obtain all knowledge from one book. For stiff clay soil have the mould-board long and slim, and for a light, sandy soil have a short one with a sharp turn. Turn over green-sward flat—roll it before harrowing, and never harrow across the furrows.

If your farm is not thoroughly drained, do it at once, or commence at once, and finish as soon as possible. I do not advise the extremes that some recommend, but drain the worst places first, and the gain will pay for the remainder. A farm that needs draining is but half as productive as one fully drained.

The best seed grain is grown on the highlands, because it matures slowly. Always get your seed from the best farmers in your vicinity, and if it is not all right they will be the most likely to make it all right. Do not purchase poor seed at a lower price.

Sow your spring grain with the drill, because it saves seed and time, puts it all at one depth, and insures better germination.

Roll all fields in the Spring. On meadows it puts the stone out of the way; on grain, it makes the surface smooth for the reaper, and the rake. Besides, a compacted surface holds the heat and moisture. Sow none but perfect seed, none that has been broken, and no trash.

Gauge the *quantity* of seed to the *quality* of the soil. It is nonsense to sow two bushels to the acre, if you know that the soil will not produce but twenty. Those farmers only sow two bushels who expect to raise 40. It is seed thrown away.

The best thing round a home is a good garden. To insure one it needs to be well drained, thoroughly trenched if the soil is tenacious,

not a stone in it and a good quantity of fertilizer. Several loads of sand and muck will not hurt the best one in town.

Grubbing out stumps is costly; blow them out with dynamite, at 10 cents apiece. Dynamite is exploded with a blow. Large rocks are treated in the same manner. If you cannot blow them up bury them two feet below the plow. You cannot afford to plow round them.

Never plow close to a tree, whether an ornamental or a fruit tree: the tree is worth more than what you will get from under it, and after it is fairly started it is wicked to mar it.

You cannot afford to raise your kindling wood in the orchard or fruit garden. Trim off the surplus limbs while small. Do not let the worms eat the foliage of fruit trees; leaves are the lungs of the tree, and to have them lacerated destroys the fruit.

Insects that are pernicious, ought to be destroyed in the egg, do not let them multiply. A stitch in time saves ninety-nine. Ten cents' worth of hellebore will save a bushel of currants. Commence very early with the hellebore; hardly one in ten is quick enough.

Do not plant corn in the Old Moon, but in the field that you have expressly fitted for it, and when you are ready plant without regard to the moon or other planets. Corn is not a lunatic.

Get your seed from a colder climate, if it has matured, and to be sure that it will germinate; try some of it before you want it. Put enough in the hill for all competitors. To keep the crows from pulling the corn, be there first, and assert your rights.

Wash your sheep this year better than ever before, because the buyers have you on the hip. They will assert that the tariff has knocked the wool market down 10 or 15 per cent., and how are you going to disprove it? They always have their own *weigh*.

Put your wool up in the best condition possible, have it clean, the fleeces in good shape, not too much string, and place it where it can be seen to the best advantage. This is your duty, and you have the right to make it look just as good as you can.

Do not despise little things. The success of the railroad is in the flange on the wheel, the success of the drill in the little wooden pins, and the mowing-machine on the reciprocating motion of the knives. The squall of a goose saved Rome.

It is of no benefit to fence a field unless it is fenced completely. To leave the bars down, is as bad as no fence. After a field is sown to clover, a little plaster may save the seeding. A single load of manure, rightly applied in the Spring, where some wheat is being killed with frost, pays for itself, ten times.

Have a time and place for everything, and at the time have everything in its place. This a good adage, but it is not true. There is no *time* for idleness, or *place* for a shirk. There is always time to study and a time to think. He knows most who has thought most. He that can appropriate the thoughts of those with whom he comes in contact and utilize them, becomes wise.

Do not go after foreign fertilizers until you have used all that you have at home. To pay 10 dollars, or 30, for the plaster that you get in many of the commercial fertilizers is "paying too dear for the whistle." Make your own fertilizers, and save the profit, or the transportation. Either will pay.

Try salt as a fertilizer in combination with muck, marl, lime, plaster or ashes. It may be soda that you want and not phosphate. The soil may need lime, or sulphuric acid, or a mechanical loosening, and the effect may be just as good as with a costly foreign product.

Never attempt to mow with a dull scythe. It is time and strength saved to have it sharp. It is equally true with the mower. The guards want to be sharp as well as the knives. It takes two blades in shears to cut well and the same in a machine.

Have plenty of help in the meadow or harvest field, and if any one looks on let it be yourself. You are then ready to lend a helping hand to him that needs it, and the business does not have to stop even if the constable should come and summon a man on a jury. Have your tools in the best order possible. A dull knife can cut butter, but not without greasing it.

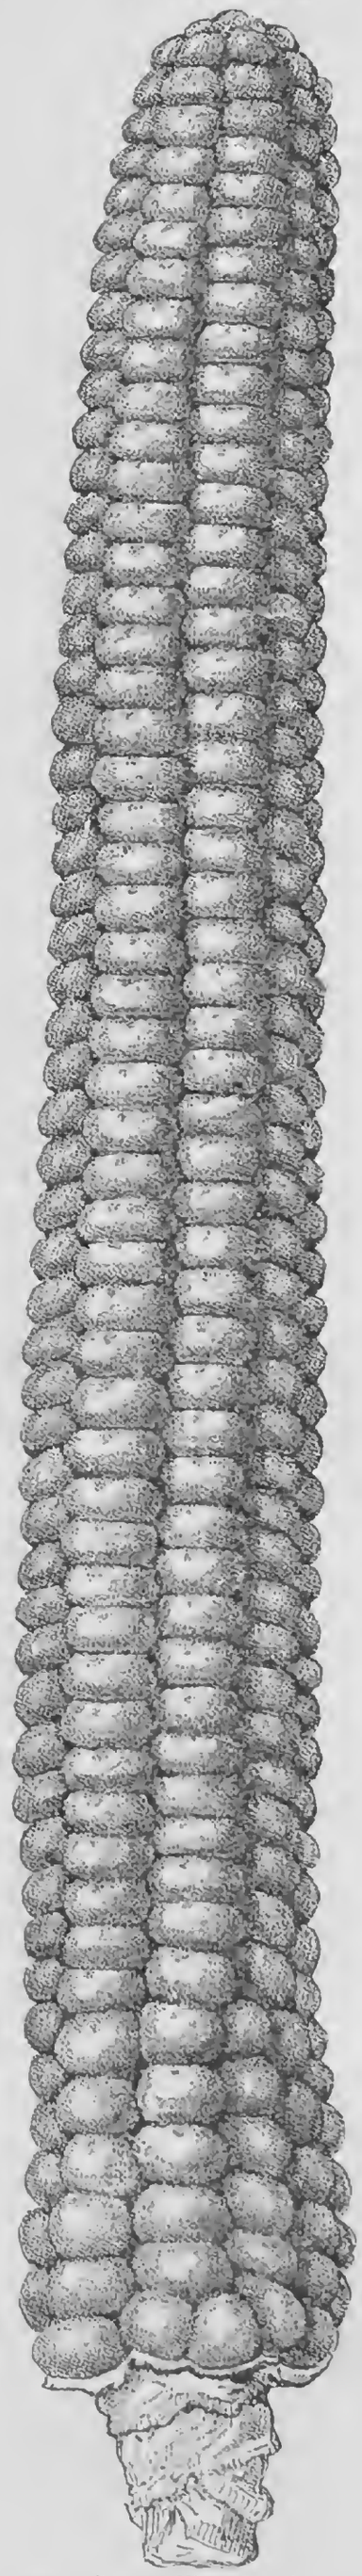
It is wisdom to know, that yourself does not know,
And in knowing to know that you know what you know.

HOMER D. E. SWEET.

PUDDLING AND WATERING.

Mr. Edwin Taylor, of Kansas, in the Rural of November 13, reports that his practice in this matter is somewhat at variance with some of my positions on transplanting, as expressed in an essay read before the American Horticultural Society at Cleveland, Ohio, in September. These "positions" were bare statements of the results forced upon me by actual experiments, made, it is true, within the limits of what might be termed a rather good-sized village-garden, and in a season which could have been much more unfavorable for transplanting; but they were repeated in several series, and with all possible care. The outcome was the same in every instance, showing me that a reasonable amount of moisture already in the soil makes success in transplanting much more certain than an even larger amount of moisture artificially applied afterwards. If the soil is very dry and parched, water, in some way or other, must be applied, or failure will be the result.

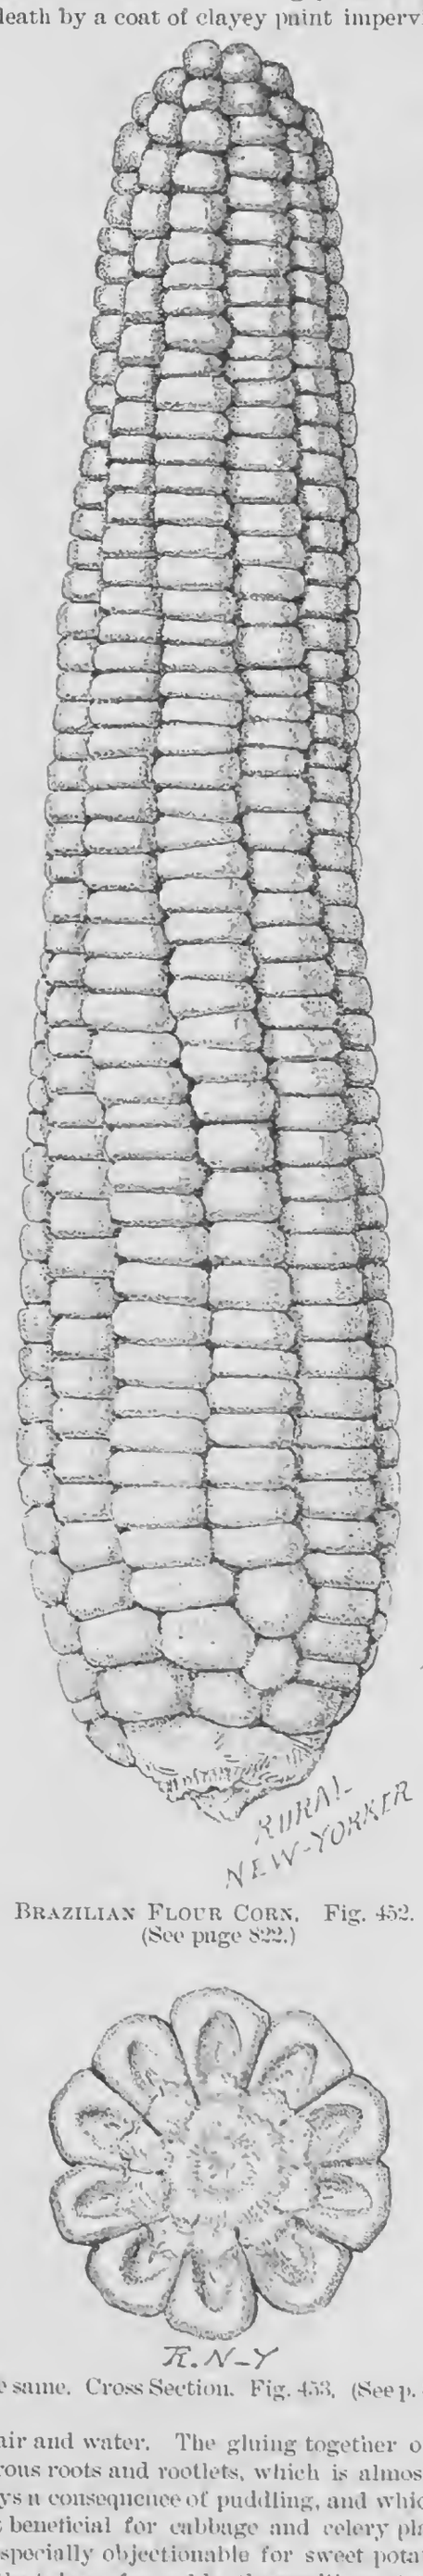
That plants, after being pulled up from the



Self-husking Corn. Fig. 451. (See 1st page.)

seed-bed, should be carefully guarded against the drying influence of air and sun, hardly needs special mention. When many plants are to be transplanted at one time, they may be placed in a pail or pan partly filled with water, and thus kept moist. The boy who drops the plants should not go faster than the planters who follow him and set the plants. In this manner the latter, or their roots, will not be exposed to sun and air for more than a very few minutes.

The objections to puddling are so numerous and so serious, that I believe "puddling will have to go," certainly with the progressive horticulturist. The only object of this practice can be to keep the roots from getting dry and to form at once a close relation between the roots and the soil in which they are placed. Clean water will do this fully as well, without the inconvenience of handling muddy plants, and without the risk of having plants choked to death by a coat of clayey paint impervious



Brazilian Flour Corn. Fig. 452.
(See page 822.)

The same. Cross Section. Fig. 453. (See p. 822.)

to air and water. The gluing together of all fibrous roots and rootlets, which is almost always a consequence of puddling, and which is not beneficial for cabbage and celery plants, is especially objectionable for sweet potatoes, as the tubers, formed by the swelling of these bunched-up rootlets, are very apt to be crowded and often twisted together right in the center of the hill, when they might have grown considerably smoother and larger if spread over a larger space. I do not believe in puddling, and want none of it, and I find my views backed up by the experience of many of our most successful market gardeners and horticulturists.

But if puddle you must, I would recommend a method which might be called a modification of the common way of puddling, and which has all the advantages of the practice and few of its objectionable features—dip the roots in water and sprinkle them with dry soil or dust, thus protecting them from drying and yet keeping the rootlets apart.

Monmouth Co., N. J. T. GREINER.

Farm Economy.

THRASHING CORN WITHOUT HUSKING.

HOW IT IS DONE.—ITS ADVANTAGES AND DISADVANTAGES.

The new way of extracting the corn from the stalks with the ordinary thrashing machine, mentioned in the Rural last year, has attracted so much attention and brought so many inquiries from those anxious to know more about the process, that, after fuller experiment and knowledge, I will say more about how to do it and its advantages and disadvantages. The machine used may be any separator-machine, such as is used for grain thrashing, or an old superannuated machine will do, providing it is strong and in good working order. To prepare it for corn thrashing the sections containing all the teeth, except two rows, should be removed and some hard-wood plank substituted in their place. The sections containing the remaining teeth should be "lowered" more or less according to the corn to be thrashed. The corn should be well cured and the stalks must be dry in order to keep well when put into mow or stack. It is fed to the machine "butts" foremost, and as fast as the mill will properly clean the thrashed corn or the elevator will carry away the stalks. The better way is to thrash as fast as it comes from the field, although if quite dry or a machine can not be obtained at the time, it may be drawn and piled upon the mow and thrashed from there. In order to be easily handled it should either have been bound in smallest bundles when being cut, or else have the "stoots" divided into them and be well bound before loaded upon the wagon for the barn.

The Advantages of this method of harvesting corn are rapidity in getting the corn under cover when in proper condition, thus enabling the farmer in one or two days of good weather to house quite a large crop, also in separating the corn from the stalks. From 400 to 600 bushels of shelled corn, or even more, may easily be thrashed in 10 hours with a good machine, and be cleaned free from leaf, silk or cobs. The stalks are put into better condition for keeping. The big "butts" are so much torn and broken up and so thoroughly mixed with the drier leaves and smaller portions of the stalks that when put into mow or stack there is little danger of mold, and if when being run through the machine a little dry straw be thrown upon the elevator with them, or if it be mixed with them when being put into the mow or stack, there will be no danger of injury, even when the stalks are quite green. The stalks are taken from the fields with the corn, thus clearing the ground ready for fall plowing, many days or weeks even in advance of what can be done in the old way of hand husking, enabling the farmer to have this important work done before the disagreeable weather almost sure to come later in the Fall.

The Disadvantage can all be covered under one head so far as I have been able to find them—the shelled corn is, of course, not as dry or thoroughly cured as would be needed for storing in bins or in a very close barn, but this can be easily overcome when one has plenty of barn-floor by spreading the corn not more than one foot deep over the floor and having it shoveled over once a day for a few days, at the same time keeping the barn doors open and allowing a very free circulation of air, or if one happens to have a lot of old corn the two may be mixed together to the improvement of both, as the old corn will absorb some of the moisture and thus become less hard and more easily masticated if to be fed whole, as it usually is to sheep. J. S. WOODWARD.

Winter Feed for Milch Cows.—We believe in Stowell's Evergreen Sweet Corn every time for a main crop of fodder. This we cut when the first lower leaves fire, tie in bundles with bands of rye straw, setting six bundles in a shock, and binding the tops with another band. This, in ordinary weather, will cure so thoroughly that it can be put away in stacks or in a mow. We cut the fodder and sprinkle the bran and meal on it. This, alternated with hay and roots, which latter we chop with a shovel in a tub made of a cider barrel sawed in two, makes our winter feed for dairy cows. Our bran is new process; our meal corn-and-cob. A No. 2 scoop shovelful of bran with two to six quarts of

meal, according to the needs of the animal, forms our grain ration.

Buffalo, W. Va. C. P. L.

Rural Topics.

CORRESPONDENTS' VIEWS.

KINDLING WOOD.—Grocerymen in the cities do a good business at selling kindling wood. Those who build city fires want something that will kindle into a blaze quickly. In many a country home there is a scarcity of good kindling. I have seen women trying to shave or whittle a stick with a case-knife. In a few hours farmers could make enough kindling wood to last all winter. The wood sold at the city stores is dry pine cut into thin slivers and dipped into melted resin. We also buy little balls or blocks that blaze enough to start any fire. These are made by mixing a quart of tar and three pounds of resin, melting, and then working in all the dry pine sawdust possible. Spread it out and when cold chop into lumps. There ought to be a basket of these where the farmer's wife can reach them handily. B. H. J.

Brooklyn, N. Y.

PRESERVING PAINT BRUSHES.—Farmers generally do not paint as much as they would if brushes were not so costly, for if not properly cared for they soon become useless. I have used a brush for four years past, painting my cart and sheds, my front door and many other things, and it is a good one now. When painting, and the job is not done by night-fall, put the brush in water; it will keep in good shape for some time. The best way, when you are done, is to wash the brush with soft soap and hot water, put it away with the bristles straight, and a good brush will last for years as mine has done. J. H. T.

Medford, Maine.

BEES NOT DOING WELL.—The bees in this locality have not done well. White Clover was very scarce and there are but few basswood trees, so the bees had to put up with what they could get. They took advantage of the buckwheat bloom, but since that they have been resting. Golden rod yielded some honey, but, like the buckwheat it was limited. I have come to the conclusion that my bees (hybrids) have lost their business grip and are uncommonly lazy. Perhaps it comes from associating with me. I have been feeding them sugar sirup for the past two weeks, and have just finished packing them in chaff for Winter. W. M. B.

Angelica, N. Y.

Horseman.

HORSE BREEDING IN ILLINOIS.

I HAVE referred to the measure and extent of draft horse breeding and feeding in Central Illinois, and I have not forgotten to speak of the "rush" fast horsemen are making to secure a large share of the profits which are supposed to attach to fast as well as draft horse breeding, when both are properly managed. But the draft horse men have taken a new departure to increase the stock of grades by bringing into this State Texas pony mares. These they have stinted to their full-blood heavy-weights, and herds of brood Texas mares are quite as common a sight in the corn and cattle counties as flocks of well-bred sheep—that are not as common as they ought to be, now that mutton and wool, both, are on the advance. If the draft horse men carry this experiment wi h Texas mares forward on a large scale, heavy-weight grades will soon fail to sell at three or four times the price, pound for pound, of fat four-year-old steers, and the drayman will be able to renew his motive power at something less than a whole year's earnings.

As yet I do not hear that breeders of fast trotting and running stock have turned their attention to these half-wild horses of the Texas and the Southwestern plains; but if they do, and cross judiciously, something like a new race of horses for light and fast work will be the result. In a Percheron or Clyde-Texas cross there is no danger of lack of size and weight, but great fear of deficiency of bone and muscle to sustain and propel it—a fact often demonstrated in the common light-weight and draft pure cross—the example being not unusual of a 1,300 or 1,400-pound body insufficiently sustained on legs and feet not too large for an 800 or 900-pound horse. But the Texas Thoroughbred or trotter cross will have nothing to fear of the disproportion described—but whether the high temper and the haughty spirit of the one will marry well with the "wild devil" in the other, is something yet to be determined.

Illinois has heretofore done great things in corn, grass, cattle, sheep, and wheat, and, from present indications, within the next five or 10 years her breeders are likely to do things still greater in the breeding of heavy-weight and fast and fine horses.

I find there is a conflict of opinion among horsemen as to whether a young or old horse, full of grain and out of condition, will get the greater benefit from being turned out to pasture during the summer season, or whether exposed to the inclemencies of the Winter as he chooses to take them, but having good Blue Grass pasture to graze on, and an open shed to run to, and a full stack of hay to feed at whenever he wills, and not a few prefer the winter pasture, and report marvelous results.

Champaign, Ill. B. F. J.

STONE IN THE BLADDER.

AN English veterinarian has succeeded in treating this trouble successfully in horses. He is of the opinion that the disease is far more prevalent among horses than is generally supposed. He succeeded in cutting into the bladder and removing the concretion, and has been successful with every case thus treated. It seems probable that animals are quite frequently affected with this trouble, and are treated for other diseases of the urinary system. The symptoms are hard to distinguish from those of various "kidney" troubles. The ordinary medicines will have no effect. Only a surgical operation can remove the obstruction after the "stone" has attained any size. These "stones," or calculi, are deposits of solid, earthy matter, which slowly accumulate and enlarge. They have been known in some instances to weigh several pounds. Foods containing an excess of lime or phosphates are most favorable to their formation, but the condition of the system has much to do with this. An impaired digestion or an unhealthy state of the blood is always dangerous. When the concretions are small they can be expelled through the urethra by proper medicines. When they become too large they cause inflammation of the bladder in the horse. In the ox the bladder at last bursts, and death, of course, ensues. With human beings the trouble is more prevalent than is generally supposed. Dyspeptics and those troubled with gout are most liable to be troubled. The prevailing idea seems to be that the concretions are alkaline, and the first thought is to indulge in acid drinks. The exactly opposite treatment is correct. Most of the "stones" are formed by uric acid. Milk is considered an excellent drink, and the various mineral waters are recommended. Mucilagenous drinks, like gum arabic, dissolved in water, are beneficial in inflammation of the bladder. Large concretions can be taken out through an opening made in the bladder from the outside, or crushed and washed out through the urethra. Some of the most noted characters of history have died from the effects of this trouble. Its great danger lies in neglect and an unhealthy way of living.

Miscellaneous.

CATALOGUES, ETC., RECEIVED.

SAFETY REIN HOLDER. Circular from E. E. Brewster, Holly, Mich.—This little implement can be fastened to the front of the vehicle. When the rider alights, the reins, with one motion, are securely fastened, so that it is impossible for them to fall under the feet of the horses. The usual practice of winding the reins around the whip or the hub is all wrong. Many runaways originate by the falling of the reins under the horses. In any event, a horse can easily, in five minutes, stamp damage enough out of the reins, if he can once get them under his feet, to more than pay for a rein holder. A picture on the circular represents a young man and young woman riding blissfully along in a sleigh with the reins securely held by one of these holders. What young man will need a stronger inducement to secure one before sleighing fairly sets in?

POCKET CUTLERY, RAZORS, SCISSORS, AXES, ETC.—Price-lists and catalogues from Maher & Grosh, Toledo, O. This pamphlet contains about as much knife lore as one will be apt to find in any book of similar size. The various cutting implements are all illustrated and described, and prices are given. We have always obtained full satisfaction from this house and believe our readers will be sure to find just the knife, razor or axe to suit them in this catalogue. Every person needs a knife. Get a good one while you are about it. The spools of wire advertised in this catalogue are very handy. You ought to carry one in the wagon or carriage. The wire is of all sizes, from hair wire for flowers, bonnets, etc., to a size large enough to mend a broken shaft. Send for this catalogue and look it over.

BURR STONE MILLS AND MILL MACHINERY. Catalogue from The Edward Harrison Mill Co., New Haven, Conn.—The Harrison Mills are made in great variety. Great superiority is claimed for them on account of their strength and durability, because of the excellence of the material used in their construction, because they are simple and easily understood and are economical in power, room, help, time and freight. These claims are supported in a straight-forward way in this pamphlet. Full directions are given and all explanations are clear and simple. The catalogue contains a biography of Edward Harrison, the inventor of the high speed system of grinding grain, besides other valuable information.

THE CHAMPION EVAPORATOR CATALOGUES, FROM E. H. GRIMM & CO, PORT HUDSON, O.—These evaporators are made with corrugated pans in such a way as to materially lessen the size of the stove tank, without lessening the heating surface. The automatic regulator and the portable syphon are also important improvements. Great care is taken in their manufacture, and the best material is used. In addition to the description of the Champion Evaporators, these circulars contain valuable information for all who are interested in the manufacture of maple rup or sugar, sorghum molasses or fruit jellies.

NEWSPAPER ANNUAL.—This volume for 1886 is published by N. W. Ayer & Sons, of Philadelphia, Pa. It is carefully prepared and contains a complete list of all newspapers published in the United States and Canada. The population of every State, county, and every place where a newspaper is published, is given, as well as the political majorities and the votes cast for minor presidential candidates. A valuable book for advertisers. Price $3.00.

METHODS OF ANALYSIS OF COMMERCIAL FERTILIZERS.—Proceedings of the third annual convention of official agricultural chemists. A Government pamphlet.

CONDITION OF DAIRYING IN THE PRINCIPAL DAIRY STATES for the season of 1885.—From the Agricultural Department.

SOCIETY FOR THE PROMOTION OF AGRICULTURAL SCIENCE.—Proceedings of the seventh annual meeting.

KANSAS STATE BOARD OF AGRICULTURE.—Reports for the months of August and September.

MASSACHUSETTS HORTICULTURAL SOCIETY.—Transactions for the year 1886. Part I.

What Others Say.

PRESIDENT CHAMBERLAIN'S INAUGURAL ADDRESS at the commencement of the Iowa State Agricultural College should be read by every farmer—indeed, by everyone. W. I. Chamberlain has shown himself to be a good, true man, and the college and people of Iowa may rest assured that whatever he undertakes he will carry through with all his might, and he has both the education and the practical farm experience which, guided by sound judgment, will render his work most effective.

Industrial education needs no defence, he says, in the house of its friends. Only those who are ignorant of the fact longer sneer at agricultural and industrial colleges. . . .

Cornell, in New York, and the State Agricultural and Mechanical Colleges of Michigan, Iowa, and Kansas, for example, have reached that stage of wide and prosperous usefulness that cares little for carping criticism or attempted ridicule. . . .

For many centuries the schools and colleges trained the mind alone, to the neglect of the eye, the hand, the body. They gave an education, passive rather than active: knowledge, rather than the power to use it; they taught to be, rather than to do; they hewed timber, but never built the house. The eye was simply used, not trained; used, too, mainly as a mere avenue to the mind, or a means of conveying to it language, and thought through language. . . .

Blunder or not, the facts are that we have these bodies; that they are integral and inseparable parts of that personality we call ourselves; that when these bodies are properly fed and cared for, and the laws of their organism obeyed, they are healthy, and our minds can work well, otherwise not; that they, the bodies, not only furnish the only avenues through which our minds are sensibly reached, informed, educated, made happy; but the only means by which that education may be made of any value to the world. . . .

The trained mind can work well only in and through a healthy and well trained body. On the the other hand, the trained eye and hand and body are little worth without the trained mind to guide them. And yet our schools have trained the minds and neglected the bodies of one set of men, and our farms, trade and machine shops have trained the bodies and neglected the minds of another set of men and then we have wondered that the world's progress was so slow. The college graduate of thirty years ago, after twelve years at school and college spent mainly in studying words, language, thought, abstract relations, and knowledge of the past, the absolute and the necessary, found himself suddenly launched into a world of living men and concrete facts. Now he must meet men as rivals and antagonists, not as fellow students or kindly, helpful instructors. He must handle tools and machines, and deal with forces of which he has scarcely even read. He knew much; much too, that was valuable as a mental training, and indirectly valuable in some line of professional work, but he could do little in the way of the world's widely varied activities; for he had not been trained. Yes, he had been trained to think and speak but not to do; and he soon found that thoughtful doing in this world is in far greater demand than thought and speech without the doing. His college course had almost ignored industrial pursuits and the training that fits for them, though the whole fabric of modern civilized society rests upon and is fashioned by industrial pursuits. His college course of thirty years ago trained simply mind and tongue and pen to form and utter thought, not eye and hand and body, as skilful agents of the mind, to do its bidding. . . .

If the thinkers had been trained to do and the doers to think, what an uplifting of the human race there would have been. It takes both mind and body, both thinking and doing, both knowledge and skill to subdue the earth and make the mighty forces of nature do man's bidding. Then why not train mind and hand and eye together. Why train the mind alone of one set of men, and the hands or eyes alone of another set of men, only to work at cross purposes? Why "put asunder what God hath joined together." Why refuse to see that "knowledge is power" only when it is applied knowledge? . . .

What might not our schools of learning have done for the race, had they 20 centuries ago begun the kind of work, studied the class of subjects and used the modes and means of training and research now found in our best technological schools. For 20 centuries the schools, one might almost say, redug the mines, replowed the fields, and thrashed again the straw of Grecian learning. They imitated the Greeks instead of emulating their originality. They garnered precious seed, and, fearing to plant it lest it should be lost to the world, they wrapped it as in the winding-sheet of an Egyptian mummy and kept it safe for centuries. Like Lot's wife, they looked back, and like her they seemed turned into pillars of salt—salt to preserve the learning of the past. . . .

This method of training hand and eye and body with the mind, develops the physical powers, invigorates the health and utilizes the natural force and bodily activity that might otherwise go to college deviltry and even to vice and sin. In point of fact, "class rushes," "hazing," and other tricks and evil deeds of boyish exuberance, are far more rare in schools pervaded with the industrial idea; for

> "Satan finds some mischief still
> For idle hands to do"

even if the mind is kept active. The young man's physical energy must have a physical safety valve. . . .

The physical with the metaphysical and literary studies give better discipline than the latter can do without the former, and we don't propose to discard, but wisely to use, the literary, historical and metaphysical with the physical. In short, to make the college course "broad, liberal and practical" as required by law. . . .

Third, and most important, the experimental, industrial or laboratory method of study and instruction, not only gives the student the power to use his knowledge to advantage, but even gives him a far better and fuller understanding of the theoretical. You learn little of chemistry from book and teacher alone. You must handle your own blow-pipe and chemicals before you know *them*, and not merely about them. You learn little of geology from books, without a working cabinet and a teacher to show you how to use it. Show the actual things that the books describe, in quarry, mine, railway cut or tunnel, or upheaved mountain rocks, where nature's mighty forces formed and modified our earth, and left there the visible "footprints of the Creator." The senses must be used on sensible objects, and trained to clear perception. Though we describe a strawberry ever so minutely to him who has never seen one, he gets no notion of it. But if he sees, smells and eats one he knows what a strawberry is. Long verbal descriptions of Alpine charms convey little idea, while actual sight or even

stereoscopic views make you acquainted with the very objects. Knowledge of the skill in mechanical and perspective drawing not only made solid geometry and mechanics clearer than it is possible without, but opened wide the door to useful invention. . . .

The motto of the Iowa college is, "Science With Practice," and even our oldest colleges and universities are beginning to believe that practice is the road to science; that is, to classified knowledge. The truth is worthy of the very lips of Christ. "If any man will do His will, he shall know of the doctrine" Soon all will, he believes, be compelled to give the fullest facilities to scientific hand and eye training to aid the training of the mind. . . .

It seems plain to Pres. C., from the known facts of history in regard to the passage of the act, that the intention of Congress was to found a class of colleges essentially different from the class that then existed in this country, viz; in the main, literary and classical colleges, founded chiefly to educate young men for the Christian ministry (a noble end), or for law, medicine and literature, with courses of study adapted to that end, and in point of fact actually sending the bulk of their students into the so-called learned professions. Up to several years after the time the land grant was made, the classical colleges drew half their students from the farms and returned only one out of fifty of their graduates to the farms. That is, of the farmers' boys that came to them, they sent back to the farms only one in 25. The percentage was probably about the same for the mechanic arts. Now, it seems plain that if these new colleges were, by the very title of the act, to be for the benefit of agriculture and the mechanic arts, and if their "leading object" must be, by law, "to teach such branches of learning as are related to agriculture and the mechanic arts," then their subjects of study, their methods of instruction, and their entire atmosphere and tendency must be different from those of the old-time colleges, founded to educate men for the Christian ministry and the learned professions. Otherwise these "industrial and agricultural" schools will be found taking 25 young men from the farms and shops to every one they return to them. This matter seems to be clear and plain. And yet, oftentimes the presidents of these land-grant colleges, like Pres. Chamberlain, grudnates of classical colleges, but not like him in after life, in providence of God, thrown into earnest sympathy with the interests of agriculture and industrial affairs, have in their inaugural and other addresses used their wealth of logical and theoretical resources in trying to prove that the law of Congress compels about the old-time classical and literary courses in these new colleges. With sadness, he is compelled to believe that oftentimes "the wish is father to the thought."

WOBURN ENSILAGE EXPERIMENTS.—Owing to the agricultural hard times in England of late years, a great deal of attention has been devoted to the ensilage problem. Stock raising for the shambles and the dairy has become the sheet-anchor of English agriculture; if that gives way the industry will drift to wreck on the rocks of domestic landlordism and foreign competition. Owing to the frequent rains and moist, uncertain climate, enormous losses are incurred annually in the curing of hay in the open air; hence various plans have been tried for drying hay artificially in mow and stack; but hitherto with no marked success. The system of ensilage affords a means of preserving grass in a condition suitable for feed without curing, hence its great importance to hard-pressed English farmers; for if the losses ordinarily incurred in curing hay are avoided, the gain will be equivalent to a decrease of outlay in feeding stock, so that English stock owners will have a better chance to compete with their foreign rivals. As Indian corn—the principal fodder plant ensilaged in America—is not grown as a field crop in England, experiments have been made in ensilaging the various grasses, rape, vetches and different cereal plants cut green. The most important English experiments in this and other agricultural problems are those made at Rothamsted, by Sir John B. Lawes, and those made by Dr. Voelcker, at Woburn, one of the country seats of the Duke of Bedford. The results of the ensilage experiments at Rothamsted were condensed in a late issue of the RURAL; the results of those at Woburn are given by Dr. Voelcker in a late report in the "Journal" of the Royal Agricultural Society. The first year's experiments lasted four months, and were directed to the testing of the relative feeding values of silage made from inferior grass, as compared with roots and hay-chaff. The evidence of the experiment showed distinctly in favor of the latter. A second experiment was tried in 1885-6, the silage on this occasion being made from meadow grass of very greatly superior quality to that employed previously. The bullocks used in the experiment were three-year-old Herefords, "as these, in all the experiments at Woburn, have proved much quieter and more kindly feeding and regular animals than Short-horns." The experiments were on "sour" silage *v.* roots and hay-chaff; "sweet" silage *v.* roots and hay-chaff; oat silage *v.* roots and hay-chaff, and oat silage *v.* hay. The results showed that bullocks fed on sour grass silage of good quality will fatten well, although not quite so well as when fed on a mixture of roots and hay-chaff. In the case of sweet silage there was also a gain in favor of roots and hay-chaff. It was proved, however, that oats cut green and made into silage will produce a very valuable feeding material, and one which, in the instance under notice, proved superior to either roots and straw-chaff mixed, or to hay. Further, the interesting fact has been brought out that such silage will, if well made, keep perfectly good for at least two years, so that its immediate consumption is not imperative.

HONEY AND HONEY PLANTS.—The flavor of meat depends considerably upon the character of the food upon which the animal has been fed. For example, there is a perceptible difference between corn-fed beef and beef made from an exclusive diet of cotton-seed. In a still greater degree does honey appear to be influenced by the food of bees. Dr. Brown, in the American Bee Journal, states that there are localities where the honey not only takes its flavor and odor from the flowers from which it has been gathered, but it also does, to some extent, imbibe the medicinal and toxical properties of the plant. The observations upon which this opinion is based were taken at the South. The leaves of Helenium tenuifolium have a bitter, nauseating taste. During the war, an extract in the shape of tea was used to some extent as a substitute for quinine. Honey from this plant is bitter and possesses medical properties. Honey from the Yellow Jasmine possesses all the toxical properties of the tissues of the plant. Dr. Brown knows of six cases of poisoning by eating Yellow Jasmine honey within the past four years. It is well to remember that we have less than a half-dozen plants that secrete nectar of a deleterious quality; and nature has most wisely set limits to this function by either causing them to bloom at an unpropitious season, or by making their bloom uninviting to the bees, or by curtailing the honey to the smallest possible amount.

CAPILLARY SIPHON.—In the Scientific American Dr. T. O'Connor Sloane shows how the action of capillary force can be put to a very practical use. This force can be seen in a lamp wick or in blotting paper. If any object which water can wet has one end placed in a vessel of water, the fluid will rise on it. If the object be bent into the shape of a siphon and has one end carried below the level of the water, it becomes a true siphon and will slowly empty the water. A towel, for example, placed in a pail of water with one end hanging over the side below the bottom, will empty the pail. A capillary siphon can be easily made by doubling and bending a piece of wire into the proper shape. This serves as a frame about which strips of muslin are wrapped. With one end placed in a pitcher of water with the other end falling a little below the bottom of the pitcher, the water will quickly begin to drip away from the end outside the pitcher and in time will empty the vessel. In treating cases of inflammation, it is frequently necessary to resort to irrigation, that is, frequent applications of cold water. This is usually effected by applying wet cloths to the place and continually renewing them. This involves constant attention, and this is impossible without an attendant. If a cloth could be spread over the inflamed place and a slow dripping of water be maintained from a simple capillary siphon, the desired result would be reached with very little trouble.

CHICAGO AS A GRAIN MART.—The fact that receipts of wheat at Chicago this season have declined, and that what it has lost in this direction has been gained largely by Minneapolis and Duluth, has stirred up newspapers as well as members of the grain trade in the Northwest. It is noted, too, that the chief grain inspectors at Chicago and a committee from the Chicago Board of Trade have been examining the methods of handling grain at the northwestern cities named, presumably with the intention of improving their own when they get home again. It is alleged that Chicago has thus far graded wheat which was not quite clean quite low, against the merits of the gram, and that from this practice the opportunity to buy good wheat cheap and clean it (say at Milwaukee, after paying extra carriage) has given rise to a regular business in that line at the cost of consigners. Meanwhile the practice is working its own cure, and Chicago is surprised to realize that Minneapolis, St. Paul and Duluth grade wheat subject to cleansing, that the elevators are all fitted with cleansing apparatus and that a State weighing law are among a few reasons why Chicago's long supremacy as a grain market had begun to show signs of a decline.

TO CURE A STUMBLING HORSE.—Some good horses, says the Pittsburg Stockman, are addicted to stumbling while walking or moving in a slow trot. A well-versed veterinarian states that there are two causes that would tend to produce this faulty action; one a general weakness in the muscular system, such as would be noticed in a tired horse: the other, a weakness of the exterior muscles of the leg, brought about by carrying too much weight on the toe. To effect a cure, he adds, lighten the weight of each front shoe about four ounces; have the toe of the shoe made of steel instead of iron, it will wear longer; have it rounded off about the same as it would be when one-third worn out, in order to prevent tripping; allow one week's rest; have the legs showered for a few minutes at a time with cold water through a hose, in order to create a spray; then rub dry briskly from the chest down to the foot. Give walking exercise daily during the week for about an hour twice a day. When you commence driving again, omit the slow jog, either walk or send him along at a sharp trot for a mile or two, then walk away, but do not speed for at least several weeks. By this means the habit of stumbling from either of the above causes will be pretty well overcome.

WOOL SUPPLY IN THE ARGENTINE REPUBLIC.—Consul Baker, of Buenos Ayres, reports that the wool season of 1885-86 in the Argentine Republic already exhibits a large deficit in the returns for the previous year. The reports for this season from October 1 to July 15 are 284,000 bales against 315,000 for last year. The apparent shortage in the total wool clip is about 30,000 bales. The deficit in reality, however, is much larger than this, as every year heretofore there has been an average balance of 20,000 bales carried from one clip to the next, while this season there is no stock whatever on hand: so that the actual deficit is upward of 50,000 bales, equal to upward of 30,000,000 pounds. The prospect for the approaching wool clip (1886-87) is thought to be still more unpromising. The Winter had been very severe on the flocks.—Winter there is Summer here.—The next clip, it is predicted, will be 75,000 bales, or 45,000,000 pounds below that of 1884-85.

SUCCULENT FOOD FOR STOCK.—In behalf of the Royal Agricultural Society of England, 450 inquiries were recently sent out to farmers there asking their experience during the remarkable Winter of 1885-86. It appears that as a rule the root crops were short, and the question was asked, "How did you provide food, and especially succulent food, for your cattle and sheep during the long Winter?" The answers, according to the Live Stock Journal, are various—some having benefited by having silage; others had to use a large quantity of purchased food, brewers' grains proving very helpful in several instances; while hay and grain were used to a much greater extent than usual. In the preparation of food, too, advantage was found by pulping and chaffing; but it seems that those suffered least who had provided a succession of catch crops for spring consumption. Kohl rabi helped several prominent stockmen greatly through the Winter. The well-known Charles Howard knows of no crop so valuable and early and cheaply cultivated as the cabbage, which has greatly helped him through many difficult Summers with all kinds of stock. Several others speak very highly of cabbage as stock feed in Winter; some saying that it is a very reliable plant, for "however great the drought, it produces a succulent winter feed more valuable than silage."

POINTERS.

A WRITER in the N. E. Homestead says that a Cotswold sheep in thin flesh with long legs is a pitiful sight. On the other hand, this breed when perfect is scarcely equaled by any for beauty. It is urged that we separate the lambs, breeding ewes and others into suitable flocks, according to size and condition. The vigorous and strong should never be wintered with the young and weak. The experience of the writer goes to show that the above suggestion pays better than the same labor applied in any other way to the flock. . . . . .

MR. A. W. CHEEVER, of the N. E. Farmer, has fed many bushels of apples to dairy cows, giving them all they would eat, without experiencing any evil therefrom. Small quantities were given at first. . . . . .

A N. Y. TRIBUNE writer says that two ounces of saltpeter, dissolved in a quart of warm water and thrown into the cistern, will remove the offensive odor of the water. . . . . .

THE Medical Reporter believes that the prohibition of the indiscriminate traffic in narcotic drugs is a question demanding the attention of the people as urgently as does the liquor question. . . . . .

THE Reporter speaks of chloral or chlorodyne-saturated women, and says it must be made a grievous crime, punishable by the severest penalties, for a druggist to sell any of these drugs save on the prescription of a physician, etc. . . . . .

IN an address before the National Swine Breeders' Association, Prof. Morrow says that those engaged in swine improvement have been remarkably successful. Not in one breed alone, but in a number, there has been extraordinary development in the qualities desired—rapid growth, early maturity, quiet disposition, readiness to lay on flesh. Differing in minor points—color, size, form as to detail—there is comparatively little essential difference between a half dozen leading breeds; and they are becoming more and more alike. . . . . .

THE time, however, has come he thinks to call a halt; at least long enough to consider the situation. The results gained are not all good. . . . . .

AN extraordinary development, taxing the organism, is at the cost of lessened or checked development of some other characteristic or function. . . . . .

WE have lessened the vitality of our hogs, and increased their liability to disease. In many cases, there is lessened productiveness. We have gone beyond the popular demand for fat meat, and raised a protest from the consumers who demand more of lean meat. The model hog of the breeder and feeder, on the one hand, and of the butcher and consumer on the other, is becoming more and more different. . . . . .

PROF. MORROW advises that we breed from mature animals. Select breeding stock with reference to health, activity and vigor, and not alone with reference to early maturity, ease of fattening or possession of the minor points distinguishing breeds. Cease to magnify petty points as essentials, thus limiting our selection. Recognize the fact that grass and clover are natural and admirable foods for hogs, old and young. Give exercise to the young and all breeding hogs. Give some variety of food and not corn alone. In food, water and shelter, give that reasonable care to secure good sanitary conditions, which common sense and experience dictate. Trust little to the advertised specifics for diseases. And help each other by experience and words of encouragement, in national, State and breed associations. . . . . .

BROWN affirms, in the Boston Traveler, that the system of indorsing is all wrong, and should be utterly abolished. He believes that it has been the financial ruin of more men than perhaps all other causes. . . . . .

A DOUBLE white begonia is spoken of in high terms in a late London Garden. The flowers are perfectly double and pure white. . .

THE Tamarisk is a little tree rarely seen in the farmer's grounds. It is as feathery as an asparagus plant and perfectly hardy. Its long plumes of pink flowers are beautiful in their way. . . . . .

CORN, says the Rural and Stockman, as an exclusive diet, is wholly unfit for a horse. It is the most heating food that is fed. Corn meal ought always to be fed with cut hay. . . .

CERTAIN facts about the hog cholera have, says the Weekly Press, a disagreeable interest for others than the rearers of swine. It seems to be the practice of pork producers whenever the infection appears in a lot of hogs to sell them at once. The probability is that the greater portion of them will die and therefore they are hurried off to market to give the butcher's knife a chance to get ahead of the cholera. . . . . .

WALDO F. BROWN met a farmer a week or so ago who said: "One of my hogs died on Monday, another the next day, and two the third. I loaded them on the cars that night and had them in the city by morning, but four were dead in the car." Another man who has a large farm run by a tenant said to Mr. Brown: "My tenant came to town and said, 'I believe my hogs have the cholera.' I knew he would have hard work to pay his rent, and I said to him, 'Go home and load those hogs on a car to-night.' But he foolishly waited a week before he sold, and 20 out of 40 died." Now, these are facts which have come to Mr. Brown's knowledge, and he says, in the Farmers' Review, that a large per cent. of the hogs marketed during the last six weeks have been from herds that were infected.

A WRITER in the Phila. Press says that if milk turns a blue shade with the approach of cold weather it is an unfailing sign of poor shelter or insufficient feed, or both causes combined. It shows that part of the carbon in the food that has been used to make cream

and butter is now consumed as fuel to keep up animal heat.....

EACH animal has its own stomach, says Col. Curtis in the Farm Journal. He also says that farmers are taking to the half-bred Percherons. Are the cattle running down,? asks the Col. Give them less below-zero.....

A GREAT many people are pious, says John Tucker, because they are afraid of the devil, and he suspects a great many politicians are friendly to farmers about election time because they are afraid they might lose their votes. For his part he will try his best to get farmers to go to our legislature, and will vote for them. The closer the times the more need of farmers to make laws and keep down taxes. Farmers are very foolish to leave all of their interests to men in trade, and to lawyers and politicians. What makes it worse is the fact that the land has to pay the most of the taxes.....

WHAT folly it is to lay out new villages in the country on the small city lot plan just as if there was no room in this broad land of ours for gardens and lawns,says another writer in the Farm Journal. The mere grasping money-maker fails to see the great influence there is in these things toward civilization and morals.

ANOTHER writer suggests that a couple of barrels of late-keeping apples buried in bran in the wagon house loft or grain bin, will come out in May sound and crisp and be a welcome adddition to the spring provender for the family .....

MR. STAHL says in the Indiana Farmer,that as the craze for commercial jellies and jams subsides on account of adulteration, the popularity of honey is bound to grow.....

MR. STAHL thinks that women usually make better beekeepers than men. Bees, he says, must be treated like children, kindly and patiently, and such work woman does better than man. Let the ambitious girl think of this way of getting a start..... .....

MR. POORE, in the Cultivator, says that working on the roads is merely another name for a leisure, story-telling day. In multitudes of cases when the roads are next to impassable in the Spring it is through the sheer negligence and laziness of the people whose business it is to make them.....

MR. POORE also says that many narrow-minded souls seem to think that every dollar they spend upon public work is the same as thrown away, merely because they cannot take it to market and get their money back the same day,with a good profit. This is one of the most mistaken notions that could well be entertained. A public road or public building is often just as important and profitable to a man as the house he lives in or the coat he wears..... .....

JOSIAH HOOPES, in the N. Y. Tribune, writes of several things which, in years past, we have endeavored to impress upon our readers. First, never prune evergreens in the Winter. Choose either Spring or late Winter. Second, drawing together the branches of trees, roses or shrubs that are to be protected during the Winter and wrapping them up closely with straw or matting will do more harm than good. It will prove destruction instead of protection. Third, one stout stake is as useful as a dozen in supporting a tree. Drive it in the ground, as illustrated in the R. N.-Y. several years ago, diagonally, and then wrap it with matting to prevent abrasion of the bark, and tie the stake securely to the tree around the matting.... ....

LIVE STOCK RANCHING, by which untold numbers of cattle on the western and southern plains suffer the pains of a hundred deaths, and tens of thousands of them die in undescribable agonies, is "the most heartless business on earth; an abomination in the sight of God, and the kings are monsters of cruelty." So says a writer in the N. O. Picayune.....

C. S. PLUMB, of the N. Y. Experimental Station, states in the Weekly Press that he has found that seed oats, soaked in sulphate of copper (four ounces to one gallon of water) for 40 hours have produced a crop free from smut.

THE Editor of the Press of Nov. 24 says that the Oriental Spruce wears a lovelier green at this season than any conifer he knows. Has he compared it with the Nordmann's Fir?

Everywhere.

TRANSCONTINENTAL LETTERS.—LXXI.

MARY WAGER-FISHER.

Los Angeles; "The greatest flower show in the United States"; poor Los Angeles oranges; a chance acquaintance; a Southern California dwelling-house; general character of Los Angeles; the craze for foreign goods; Pasadena; settlers; an ornate log cabin; women's work in the Golden State; class of teachers in vogue.

THE next day rain fell heavily. In the morning we wrote letters and in the afternoon we paddled out in the wet to visit what the "Angels" called the "greatest flower show ever held in the United States." The full name and English of the place was formerly Pueblo de la Reina de los Angeles, or City of the Queen of the Angels. The city has now a population of 30,000 probably and will continue to be for some time to come the leading town in Southern California. It was still in a "boomy" condition and land speculation engrossed considerable attention. I was not captivated with Los Angeles from any standpoint. The water was atrocious, and unless one went upon the hills back of the city the attractions were sufficiently meagre. True, there were gardens in which grew flowers, oranges and palms, pleasant to the eye, but no more so to mine than are the oaks and apples of the cold North.

The flower show was held for the benefit of a Working Girls' Home, and proved very successful financially. It was far from being the "greatest flower show, etc.," but it was, nevertheless, very well worth seeing. The bank in which it was said 14,000 roses had been placed, had endeavored to maintain a fresh appearance by the daily addition of fresh roses. Indeed the chief interest centered in the roses, which grow in California—particularly in the southern part—not only in the greatest profusion, but to an extraordinary size, larger than I have seen them elsewhere. They are equally exquisite in color and texture, but lack in perfume, as do many other California flowers. Of the roses that appeared to me most striking I noted the Chromatella, Isabella Sprunt, Triumph of Luxembourg, and Beauty of Glazenwood.

After leaving the flowers we visited one of the old Catholic churches and its adjacent garden, being entertained by a young priest with charming manners, and we also went to the garden of the Sisters' school, not far removed, where we were given the privilege of pulling as many oranges and flowers as we liked, and where the laddie plucked an orange from the tree for the first time in his life and, of course, ate it on the spot. To his mind the only saving grace of California was its orange product—a fruit of which his young mouth never tires. But Los Angeles oranges are inferior fruit as to cleanliness of rind, the unhealthfulness of the trees being manifested in black spots on the oranges and the dull mildewed look of the leaves.

One day we went by horse cars far out to the suburbs of the city, where there are beautiful residences, and where by chance we fell into conversation with a lady who invited us into her house and charmed us with her gracious hospitality, and it happened, as it so often occurs in meeting with a stranger, that she knew several people in the East of whom we had knowledge. I noticed the writing desk on the piazza,and she said that they always wrote their letters there; that there had been but three days during the entire Winter on which it was too cool for living out-of-doors. She said she wished us to see the inside of the house so as to have some idea of how Californians lived, and we followed her within. The rooms were all on one floor and opened into a central room, and could, if desired, all be thrown into one large and beautiful apartment. It was an interior of exceeding beauty, and simple as it was beautiful and artistic. I noticed in the dining room what I thought a pretty and convenient contrivance in a narrow shelf running about the room about four feet from the floor, on which were ranged the the pretty decorated dessert plates, etc., the shelves being furnished with an ornate railing to keep the china from falling off. The effect was quite novel and very decorative.

Los Angeles has various horse-car lines, a cable road, electric lights and good schools. The city is ill drained and there is more or less of malaria—from what I heard the people say. It is 30 miles from the sea. We spent several days there, making trips to adjacent points of interest; but when we finally left, and I looked after the replenishment of our lunch basket, with my customary "forehandedness," I had a little experience that illustrated not only California nature, but maybe human nature the wide world over. After a vain inquiry at several grocery houses for what I wanted, I was directed to the largest and best establishment in the city. I wanted California jellies, jams, canned fruits, cheese, etc. The grocer said he could give me jams and jellies put up in London (England) and cheese and preserves from New York! He kept almost no California fruits, as he had to cater to his customers! He had some Pasadena jelly, but wouldn't recommend it. I took some, however, and afterwards regretted that I had, and bethought me of the grocer's comment that California needed nothing so much as intelligent enterprise to utilize her products and make them foremost not only abroad, but at home. But it requires something more than enterprise to put honest patriotism into the bosom of fools who pine after something foreign!

Of the pretty towns that lie within a few miles of Los Angeles the very prettiest is unquestionably Pasadena, and it is exceedingly elegant as well as pretty. The character of the people who compose the colonies that have turned various spots in Lower California into gardens, has also given a distinctive character to the towns. They are largely Eastern people, invalid in health before coming here, educated, refined, and possessed of sufficient money to surround themselves with comfort. In a climate where for so much of the time the people live in the open air—their salvation as regards health—the dwelling houses are neither large nor pretentious, but almost invariably pretty—and it would be an ugly house indeed that vines and roses did not quickly transform into a bower of beauty.

There was a lady living in Pasadena to whose good graces I had been commended, and after leaving the cars, a few minutes' walk brought us to her beautiful home—as much of a paradise in the way of fruits and flowers as I ever expect to see, while Pasadena has ever in view the most exquisite—not the grandest—range of mountains on the Pacific Coast—the San Bernardino. We found our lady, after considerable trudging about, there being several cottages in her grounds—in the "log cabin"—a picturesque structure built of logs from trees cut on the place. They were placed on end closely together, and the roof was covered with shingles. On the inside the rafters had cross-pieces, and shingles with rounded ends formed a deep fringe—below this the wall was ceiled for about four feet—there was a foot-board, and above that a dado of Chinese matting. The interior was one room and very pretty. Its mistress, Mrs. C., said the cost of building it was $300.

I asked her various questions as to the actual success of women in California, as a good many women were being lured from the East, by the glow of advertised success that reached them from the Golden State. "It is always more in the women than in California." She said "School teaching is overdone. Housework get $20 per month, and women succeed best who know how to do housework and take care of things. Silk culture is not yet profitable. Raisin growing has been, and still is, a good occupation for women. Orange culture is expensive, and then one has to wait several years for any income from it." Anent teaching, an intelligent old Californian said that there was room in the State for high-class teachers at salaries ranging from $65 to $125 per month—just as there is everywhere. He might have added—always room at the top! I gathered from my talk with Mrs. C. that women who succeed in California were the kind to succeed anywhere, while it is true that for broken-down people the climate is restorative, because it admits of open air living the year around.

Pasadena is such a pretty place that it would seem that everybody should be charmed with it—while the people are equally charming. The orange groves were unfenced—the trees loaded with ripe fruit and fresh blossoms at the same time. While in addition to the sources of profit no stone was left unturned to beautify the town. There is also there an excellent Free Library—a characteristic of many California towns—enough to put to shame many a city in the East. Pasadena is an Indian word, and signifies crown of the valley, and the valley is San Gabriel and of unrivaled attractiveness.

SPECIAL SEED REPORTS.

WE have received reports from many of our friends who planted the seeds sent out in the last Free Seed Distribution. We can only give them in a condensed form. The main point to be discovered is which climate, sections, soils, etc., are favorable for the development of the seeds and which are not. Should we print all that our friends have kindly sent us, we could fill several numbers of the RURAL.

Canada.

GODERICH, Ontario.—Midnight Corn very productive, suckers badly and latest of all with me. Cantaloupes ahead of anything seen here. Alaska Pea earliest of the early with me. T. H.

Georgia.

AMERICUS, Sumpter Co.—Hackensack Melons "simply delicious." The Bird Cantaloupe I think a cross between some good netted cantaloupe and the old slick-skinned "musk-melon" as raised here by the negroes; worthless to eat but as large as pumpkins. I had only one good enough to save seed from. Drought cut other seeds. G. B.

FLORENCE, Stewart Co.—Angel of Midnight fully matured in four months. Alaska pea very early, but not so good as Market Garden. Bird Cantaloupe 18 inches long. The melons were fine, of good size and excellent quality notwithstanding the season was very unfavorable—entirely too much rain. J. D. A.

Iowa.

AKRON, Plymouth Co.—The Alaska Peas grew 18 inches high and were the earliest I have ever grown, and I have planted about all kinds. The Angel of Midnight Corn did well and is much earlier than our field corn. We have little use for a flint corn in this part of the country, however. The melons all grew finely, but the Bird Cantaloupes were extra nice. The Garden Treasures have elicited the highest praise from all. A. S. S.

Massachusetts.

SOUTH ROYALSTON, Worcester Co.—Success with none but "Angel of Midnight" field corn, which did fairly well. F. H. S.

Michigan.

HOBART, Wexford Co.—The Alaska Pea is certainly very early, but only a few days earlier than some others. The Angel of Midnight Field Corn did not ripen an ear. Bird Cantaloupe did not do anything, owing to drought and frost. Of the Garden Treasures only one root of mignonette and several varieties of featherfew stood the dry weather enough to show what they were. W. H.

Nebraska.

KEARNEY, Buffalo Co.—Cantaloupes grew splendidly. Many large ones. This soil is "second soil" and very productive. B E. B.

Oregon.

GRANT'S PASS, Jackson Co.—We had some very fine watermelons; the Iron-clad, Pride of Georgia and Scaley Bank did best. The Alaska pea did not have a good chance; it grew and ripened in seven weeks from planting without sufficient rain to wet the ground an inch deep. The Angel of Midnight Corn fared the same; had some good ears: very early. J. H.

Vermont.

THETFORD, Orange Co.—Alaska peas burnt by drought. Grew about two feet high. Fair, but not equal to American Wonder. Melons did not ripen. Midnight Corn grew seven to nine feet high. Some two weeks behind my common feed corn in maturing. The frost caught it. Garden Treasures fine. E. E. W.

RURAL SPECIAL REPORTS.

Illinois.

CHICAGO, Cook Co., Dec. 1.—Weather very cold and dry. The lazy farmer is finishing up and gathering corn: the forehanded farmer has cribbed his and is waiting for 45 to 50 cents a bushel for it. The condition of the corn crop varies so greatly in the "corn belt" that it is still impossible to form a just estimate of the aggregate yield. One portion of the section is importing corn from another, and the importing points are increasing, so that it is fair to suppose that the "bad spots" are very numerous and the crop won't come up to an average. Very little, if any, corn from Nebraska, Kansas or Missouri will cross the Mississippi River this season. There would probably be a great scarcity of corn were it not for the large amount of old corn carried over in farmers' "cribs." R. N.

New York.

UTICA, Oneida Co., Nov. 29.—The cheese market to-day was slow, owing to the disagreeable weather, and also being the next to the last market, with only odds and ends to close out, there was a bearish influence that kept prices down. Notwithstanding the fact that the ruling price to-day was one cent less than last week, the market is really steady for some grades, and the last meeting of the Board next week will see the old prices at the front, the year's sales at a good figure, with factories sold out on good profits. The total sales this week were 2,636 boxes, ruling at 10½ cents, which is 3,162 boxes less than last week, ruling at 11½ cents. Total butter receipts for the week 173 packages. The market is a little weaker than a week ago, but with fair demand for good and plenty of all kinds offered. Jobbers are paying 22 to 24 cents for dairy and 25 and 26 cents for fancy. The prospects are that the market will gain a little before Christmas, however. R. L.

Virginia.

RICHMOND, Henrico Co., Nov. 28.—There has been more life in the tobacco market the past week. Trading in fine cutting bright grades has been large, and there are of this class very few desirable packages left in market for sale. New cutters continue to sell very high in interior markets, and the crop so far is as inferior as has been predicted from its growth. Receipts here have been nominal only, but about the middle of December West Virginia brights will be coming in, and the new will be quotable. This State will no doubt give us a larger proportion of fine leaf than heretofore, and will be an important factor in the market this year. A very good proportion of wrappers and cutters and stripping leaf is expected, but the quantity and leaf may be smaller than usual. Old wrap

pers are gaining ground, and prices are moderate and demand irregular, but good on lower grades. Smokers are more active. Dark tobaccos are without any particular feature and transactions small Sun-cured leaf in regular demand for home use. Receipts of new dark are very small, but increasing this week. Prices realized have been anything but satisfactory to producers at 2½ cents average, and unless they meet with some unforeseen better luck in this year's product it is difficult to see how they can attempt another crop, even if they were willing to do so. It will no longer be a matter of choice, but bread and meat will have to come out of the farm first. W. E. D.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

THE HESSIAN FLY.

J. B. A., Milford, Md.—What are the habits and mode of production of the Hessian fly?

ANS.—Of the Hessian Fly (Cecidomyia destructor) there are two broods, and sometimes three in the season, the first appearing in Spring and the others in Autumn. Sometimes, but not commonly, an early Spring brood produces another late in the season. The eggs, of which from 20 to 30 are laid by each female, are deposited in the longitudinal creases in the leaves of the young wheat, barley, rye and other cereals. Those of the first brood are laid from early in April till late in May, the time varying with the latitude and the weather. The second brood flies appear in August and September and lay their eggs in those months. The eggs hatch in from four to 12 days, according to the state of the weather, seldom taking over six days. The pale red larvæ or grubs, crawl down the leaf, working their way between it and the main stalk till they come to a joint just above which they remain, a little below the surface of the ground, with their heads towards the roots, until their transformation is completed. Here they suck the sap of the plant, causing the latter to swell, turn yellow and die. They do not eat or penetrate the stalk, but merely feed on its sap by suction. The larvæ attain full growth in from four to six weeks. About December 1, the skin of the autumn brood hardens, becomes brown and then turns to a bright chestnut color, when they are said to be in the "flax-seed" state, and on removing the lower leaves they may be seen as little, brown, oval, smooth bodies, a trifle smaller than rice grains. In this condition they remain until the warm weather in April or May, when the larvæ or maggots are rapidly transformed into pupæ within their "flax-seed skins, the flies emerging from their "flax-seed" cases in the above months according to the latitude and temperature of the season. The spring brood lay eggs for about three weeks and then disappear. The larvæ or maggots hatched from these eggs take the "flax-seed" form in June or July, and it is the flies from these that lay the eggs the maggots from which injure the crops in the Fall.

Great numbers of the pests may be destroyed by burning the stubble after harvest and plowing and harrowing the land. The great objection to this practice is that the useful parasites of the flies which kill vast numbers of them every year, are destroyed as well as the pests themselves. By sowing a part of the crop early and plowing this under if affected by the fly, and then sowing the rest after the first frost, the crop has been saved; but in such cases there is danger that Winter will seriously injure the crop. If the crop is only lightly affected it may be saved by liberal manuring. The selection of varieties less liable to attack is also advisable; thus it is claimed by many that the pest does not trouble Lancaster or Fultz, while Mediterranean and still more Clawson are said to tiller so vigorously as to be exceptionally able to resist attacks. Steeping the seed and rolling it in plaster or lime tend to promote a vigorous growth and are therefore beneficial. The strewing of quick-lime over the field immediately after the grain has been cut is also recommended as destructive to the pupæ; while sowing the field with unleached wood ashes—two bushels to the acre—in Autumn and then again the first and last weeks in April and as late in May as the field can be passed over without injury to the crop, has been found beneficial. Pasturing with sheep and the consequent close cropping of the fall-sown wheat in November, and later in the more southern latitudes, will cause many of the eggs, larvæ and "flax-seed" to be destroyed, and rolling may have a like effect. Sowing the seed after the first frost is, however, commonly considered the only way of avoiding injury from the pest in the Fall.

SORE LEG IN A MARE.

W. H. H., Wellington, Ont.—My ten-year-old mare became very lame last April. I treated her for strain of the back tendon, but with little effect. A veterinarian pronounced it a case of navicular disease. His prescription was to poultice for eight days, after paring the foot down very thin. This relieved her so that she stepped on the affected foot quite boldly. Then I was to clip the hair off half way to the ankle and apply a blister. Then after a few days to apply sweet oil, and at the end of 14 days blister again with a salve-like preparation. I blistered the first time, but before the end of 14 days I became convinced that it would not be advisable to blister again. The foot swelled greatly and was so sore that she could not rest her toe on the ground. For the last six weeks the swelling around the hoof has been running most of the time. Poulticing has been of no benefit. Before the blister was applied she could walk quite well; but now she can only hobble around on three legs. Is there any chance of her recovery? I can't afford to winter her if she is of no value.

ANSWERED BY F. L. KILBORN.

The first part of the treatment—the poulticing—was undoubtedly correct; and if this had been followed by *mild* blisters the case would have done well and she might have recovered. But the blister employed was evidently much too severe, and we suspect mercury or some other equally powerful blistering agent was used, agents that should be used cautiously and only occasionally even by competent practitioners. Did you employ a regular veterinarian or a self-made "horse doctor"? This may account for the blundering use of the severe blister. As to future treatment, you can only apply soothing measures until the effect of the blister has passed. Continue the poultices with warm fomentations if the discharge has not ceased, adding a weak solution of antiseptic astringent to the poultice—as one dram sulphate of copper or one-half dram chloride of zinc to each quart of water. If the discharge has nearly or quite ceased, apply daily an ointment of spermaceti and almond oil, sweet oil, vaseline, or other bland ointment. All after treatment will depend upon the condition of the limb after recovering from the effects of the blister.

FORM OF CONTRACT FOR FARM HELP.

A. K. F., Chicago, Neb.—What is a model contract which can be used by farmers in hiring help—one that can be elaborated to suit?

ANS.—A contract may be very simple in form. In fact, any writing which states clearly what is understood as the bargain is all that is needed. The following we have used several years and found it very satisfactory:

"A contract made the twenty-fourth day of November, 1886, between John Doe, of the town of———, county of———, and State of———, and Richard Roe, of the town of———, county of———, and State of———. John Doe agrees to employ Richard Roe to work on his farm and at such other labor as appertains thereto, for (here state the time), beginning on the (here state where to begin), or so long as the services of the said Richard Roe shall be faithfully performed and reasonably satisfactory to the said John Doe, and to pay for such service at the rate of (here state wages and manner of payment), and in addition thereto (here state the agreement made as to board, washing, furnishing house, furnishing fuel, keeping cow, furnishing ground for garden, etc., etc.).

"Richard Roe, in consideration of the above agreements, agrees to work for the said John Doe, for the time and in the manner and for the compensation there stated, and that he will render good and faithful service, and in all things relating to said work he will be obedient to the commands and wishes of said John Doe and careful of his property (here state any agreement as to any special works, such as feeding sheep, running into the night or beginning very early in the morning, or if on Sundays, or whether help does chores on Sundays, etc., etc.)."

HERB CULTURE AND MARKETING.

Subscriber (address mislaid).—How should such herbs as summer savory, sage, etc., be cultivated and put up for market?

ANS.—Herbs are of the easiest culture, requiring only moderately fertile soil and to be kept free from weeds. Sage and summer savory—indeed we believe all of this class of plants—are grown from seeds, which may be planted in Spring in drills two or three feet apart. Sage is a perennial plant and needs to be sown but once for a permanent plantation. Summer savory is an annual, and must be sown every Spring. Borage, chenil, coriander and dill are also annuals. Balm, horehound, hyssop, rue, sorrel, bitter fennel, thyme, etc., are perennials. 2. Herbs that are to be dried for Winter use, should be cut just as they are coming into flower. Tie in small bunches and hang in some open, airy shed or building. When kept in the sun they dry too quickly and lose strength. The best herbs are preserved in glass jars or bottles. They are sold in bunches still, but fancy prices are obtained only for those preserved in packages.

LAMENESS IN A HOG.

U. S. M., Havana, Mich.—One of my best fatting hogs was taken lame in both hind legs, and in a few days his forelegs gave out in the same way, otherwise he seems perfectly well, eats well and seems to thrive, although he cannot stand up. I have been feeding him all the watermelons he would eat before putting him up on corn. What is the disease, and remedy?

ANS.—It is impossible to name the disease, since hogs frequently become lame from a variety of causes. In this case it may be due to a too sudden change of feed or to overfeeding on corn. Place him on a ground floor and feed sparingly on milk, slops and vegetables or apples with a little corn. One-fourth of a pint of ground linseed once or twice daily will be beneficial. If the bowels are costive give one or two tablespoonfuls of linseed oil night and morning until relieved. After recovery, increase the feed gradually.

WINTERING SEEDLING TREES IN THE "COLD BELT."

A. P., Nordeu, Neb.—Here catalpa seedlings are killed in the Winter; is it advisable to take them up in the Fall and store them in the cellar, to be replanted in Spring?

ANSWERED BY PROFESSOR J. L. BUDD.

In the West it is always best to grow the catalpa in nursery and to protect the plants during the Winter by carefully heeling them in and covering them in the open air, or packing them away in cellar. Hardier species, such as ash, maple, Box Elder, etc., it is best to plant where wanted. But if grown in the nursery it is best to take them up in the Fall and heel them in, or winter them in a cellar, as their vitality is much lowered if they are exposed to the dry zero winds of Winter. If such hardy sorts be taken up in Spring, they may live when transplanted, but they will make far better growth if properly cared for during the preceding Winter.

WARTS ON A COW'S TEATS.

T. M. H., Warren, Me.—What will remove the warts from the teats of a cow? They are very close together and too small to allow a string to be tied around them.

ANS.—Moisten them every day with a strong solution of sulphate of copper, and before applying it, rub off the surface with a piece of sand-paper. This prevents soreness and can be done while the cow is being milked. Another way:—Touch the warts daily with a piece of nitrate of silver moistened, or with a solution of it. In applying any caustic substance, one must be careful not to permit it reach the surrounding skin, and if it eats too deep it can be at once stopped by applying any grease. Warts can also be removed by applying, after milking, a paste made of baking soda just moist enough to be sticky, and put on the excrescence only. As warts are contagious, a cow having them on her teats should be milked last, or else the hands should be washed before milking another cow.

Miscellaneous.

A. K. F., Chicago, Neb.—A neighbor grows an unbearded spring wheat which yields about 18 bushels per acre, and which is called the "French Imperial." It was obtained from a Philadelphia seed house. Another neighbor grows a bearded spring wheat which yielded about the same, but has a larger kernel. It bears the same name and was sent out by the Department of Agriculture; which is the true French Imperial?

ANS.—We are not familiar with the French Imperial Wheat. Some of our readers may be able to answer the question. 2, 3 and 4 will be answered later.

J. R. V., Louisa, La.—Inclosed is a specimen of a pressed rose; the shoot of the plant has grown right through the flower; isn't this unusual?

ANS.—No, this is not very rare. We have noticed the same growth in many kinds of flowers. Every part of a plant comes from the leaf—the petals, stamens and pistils are not exceptions. Fruit buds, from certain causes, may change to leaf buds, and some interference in the development of the blow may induce the stem which bears it (peduncle) to continue growing.

A. P., Cannon Falls, Minn.—1. A piece of sandy black loam produces large straw, but very small heads of wheat; would an application of ashes be likely to cause larger heads? 2. How can poultry manure be spread to the best advantage?

ANS.—1. We advise our friend to try, on separate plots, raw bone flour, ashes and both combined. We think the results will answer his question. 2. Mix the manure with dry soil, coal ashes, etc., as collected. It may then be spread the same as any other fertilizer. Hen manure when wet can not be economically spread.

C. L. V., Orient, N. Y.—In the home-made creamer described in the RURAL of July 17, how is the milk skimmed? 2. I wish to make a small one to hold the milk of one or two cows; would it violate anybody's patent if faucets were put in the bottom of the cans?

ANS.—1. The milk is skimmed with an ordinary long-handled skimmer. 2. To put faucets in the bottom would infringe the Cooley patent.

P. W. S., Marksboro, N. J.—I had a fire kindler that I liked well. It was a can holding kerosene with a rod with a ball at the end to be let down into the oil. There was a cover on the rod so that the top was covered when the ball was put into the oil. A young man used it to kindle a fire and put it into cold water to cool it and thus spoiled it. I would like another but do not know where they are made. Does the RURAL?

ANS.—Can our readers answer?

H. P. T., Richland Centre, Wis.—Which is "the best breed of poultry to keep for profit" is a hard question to answer. If it were definitely known there would be very little demand for any of the other breeds. The favorites with the public are Light Brahmas and Plymouth Rocks, followed closely by the Leghorns. Then follow the Wyandottes.

A. W. S., Americus.—What is an analysis of whole cotton seed which has been burnt.

ANS.—According to Wolff whole cotton seeds yield 7.8 per cent. of ash, of this 32.15 per cent. potash, 31.16 per cent. phosphoric acid, and the whole seed contains 3.6 per cent. nitrogen.

Subscriber (no address).—Among good poultry papers are the Poultry Bulletin, monthly, New York City; American Poultry Journal, Chicago, Ill.; Poultry World, monthly; and American Poultry Yard, weekly, Hartford, Conn.

B. T., Maple, W. T.—The bags in which the RURAL seeds are sent out are made by Robert Gair, 163 Chambers Street, New York. We do not know whether their prices are low or high.

DISCUSSION.

J. S. W., LOCKPORT, N. Y.—M. H. B., in the RURAL, page 769, very correctly says that in nearly every farmer's garden are bushes of the common red currant so old and long neglected that they make little growth, bear only sparingly and of small-sized, inferior fruit. But I quite disagree with the course he recommends for regenerating them. It will, no doubt, greatly benefit them, but the labor and time it takes are too great, while the bushes can never be made as good as new. By far a better plan is to make cuttings of any young growth and to plant them two in a place, where it is desired to have the new bushes. If both root and grow, one may be removed to another place. With good care and proper manuring these new bushes will give nearly as much, and much nicer fruit than the pieces of the old root cut up, as he recommended, and ever after that the new bush will produce double. I have always found that while currant bushes, by constant care and much manuring, may be maintained in fair condition almost any length of time, it paid best to replace the old ones with those raised freshly from cuttings, about once in 10 or 12 years. The same is the case with gooseberries.

J. H. W., PALMETTO, Ga.—A recent RURAL said that if Kaffir Corn could be thrashed and cleaned by machinery, as wheat, rye and other small grains are, it would prove to be a valuable addition to the cereal products of the country. This point is settled with me. My crop was rather too large this year to attempt getting it out without the aid of improved machinery. I selected the "Frick Patent" thrashing machine, and with some temporary changes, it did the work rapidly and effectually—a perfect success every way.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING December 4, 1886.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, DECEMBER 11, 1886.

NOTICE.

ALL subscribers who desire the RURAL'S Seed Distribution must APPLY for it. Hitherto we have not required those who subscribe for the RURAL in connection with other papers to make an application. This has caused confusion. It is only necessary to say "SEND SEEDS."

REFERRING to the Brazilian Flour Corn shown on page 823, we may say that an average ear, as sent to us by Mr. Wilson, weighed, Nov. 15, four ounces; the cob five-eighths of an ounce. There were 10 rows, and 35 kernels to the row. The ear was not quite dry—the grain of a white color, without dents.

IT may save many of our subscribers trouble if we state that, so far as we know, money (bills) sent to us by letter almost invariably reach us safely. Inclosing bills in letters saves the bother of writing checks or procuring money orders. Still, we can not, for obvious reasons, assume any responsibility.

We cannot understand why the use of complete chemical fertilizers in the Fall is not a wasteful use of plant food in so far as the nitrogen, if in a soluble form, is concerned. Nitrate of soda or sulphate of ammonia is immediately soluble. The roots of plants (wheat or rye for example) can not feed upon it during the cold season, and the rains therefore carry it through the soil and there is little left for Spring. We cannot afford to lose the most costly ingredient of our manures. Nitrogen in organic matter, such as farm manure, blood, hair and bone, becomes slowly soluble, far less so in cold than in warm weather, so that we may safely apply them in the Fall.

THE Langshan chicks at the Rural Grounds, hatched out May 20th, are now fine birds. There are but three pullets and four cockerels. In one respect they disappoint us: the pullets have not yet layed. Their necks and legs are rather longer than we had looked for; their plumage is more brilliantly colored—iridescent is the word to express it. From all that has been written about Langshans, we had supposed a closer resemblance to the Black Cochin. But their necks and legs are longer; they are *taller* birds, and less heavily feathered down the legs. Mr. Henry Stewart once insisted that the Black Cochins and Langshans were the same. Henry Hales has intimated that the Langshan is an improved Black Cochin. But if these are fit birds for comparison, there are marked differences.

ALL who are interested in chemical fertilizers should send to the Connecticut Agricultural Experiment Station for Bulletin No 89. This gives 27 analyses of special fertilizers, and 60 analyses of nitrogenous fertilizers and guanos analyzed by the Station. Prof. Johnson has adopted the excellent method of presenting the percentage difference between the cost of the fertilizer and the station valuation. Thus "Common Sense Fertilizer" costs $40 per ton. The station analysis shows it to be worth only $15.80 per ton, the difference being 153 per cent. Charter Oak fertilizer sells for $30 a ton. The Station analysis shows it to be worth but $15.77—a difference of 90 per cent. Most of the fertilizers show a fair margin between the selling price and valuation. Address Prof. S. W. Johnson, New Haven Conn.

WE know a man who ran for a county office. He ran hard, but the other man ran harder. Somebody had to win, and our friend got on the under side. During the canvass he traveled all over the county, shook hands with everybody, and thoroughly organized his campaign. All his careful work went for nothing unless he expects to run again. Now suppose he had let politics alone and canvassed his own business as carefully as he did the county? Suppose he had found out what farm product sold best, made business friends, talked up his facilities for making good butter, cheese or whatever he had to sell, and then gone home and worked his goods into the market he had talked up? It will be a very sour man who will say he would not have been better off to-day. Running for a county office is about the most unsatisfactory business a farmer can get into. Canvassing and building up a business is twice as satisfactory.

THE practice of planting a tree as a celebration of some pleasant family event is one well worthy of encouragement. In some families a tree is always planted when the baby is christened. The tree is named for the little stranger; they grow up together. The little one comes early to know his tree and a pleasant feeling of ownership, respect and association is kindled. Surely the idea is a beautiful one. In every family there are pleasant meetings. Old and dear friends come to us from far away—start up out of the long years of forgetfulness. How can we more fittingly celebrate their visit than by planting a tree or shrub, that shall grow up with the years and whisper to us of those who helped start it into vigor? And even when death takes one from our midst, what more thoughtful tribute to the dead can there be than a tree well planted and nourished? Its strong, free-growing life will bring pleasant memories of the one that has passed away, and its leaves will whisper to us and its branches reach down to us as we sit beneath it.

FOR 13 years a driven well has been used at the Rural Grounds. The pipe is driven through the cellar 17 feet *deep* and connects with a pump in the kitchen. Another pipe connects with the cistern. The water from either the cistern or well may be used by turning a crank. The driven well has never worked satisfactorily. The water is raised with difficulty and the valves of the pump are soon disordered from the strain. It has been decided to dig a well near the house and to connect the pump by underground lead pipes with this well. Large cement barrel-pipes (three feet in diameter) will be sunk instead of using stones. The question respectfully submitted to our readers is this: Should the top of this well be covered, so as to exclude the air, as well as dust, insects, etc., or should it be left open the same as other wells from which the water is raised in buckets? We find that there is a decided difference of opinion on this subject, even among pump and well experts.

ONE of the meanest things about the Washington Seed distribution is that the bulk of the seed is purchased from a few favored seedsmen. The competition is *not* open to all. It is not the lowest price or the cleanest, purest seeds necessarily that will insure the orders from Washington. We know of a number of cases in which the prices paid for immense quantities of certain kinds of seeds were higher than those appended in the regular wholesale catalogues of well known seedsmen. We know of other cases in which the endeavors of several of the first seed firms in the country to sell the Department seeds of the best quality and at the lowest prices were unavailing—their letters of inquiry and requests for replies quite ignored. This Washington seeds business is a disgrace in every way; an imposition upon the farmer; a fraud upon the seedsmen. A few valuable kinds of seeds have been distributed by the Department, it is true, and so, too, have hundreds of kinds of inferior seeds and thousands of pernicious weeds. The farmers can put a stop to this fraud. We should require a pledge from every congressional candidate that he will use his influence to abolish the Washington Seed Store.

MR. FALCONER speaks the RURAL'S views when he tells us (see his article page 822) that he buys about everything that turns up year after year in the way of novelties. He never depends on a novelty for a crop, but takes pleasure in growing and comparing it in his trial grounds. People talk, he says, of getting swindled in novelties, but it is curious that it is "we old fellows that have practically engaged in this growing and experiment business for a quarter of a century or more, who buy and try the most of the novelties every year." "We are only doing a little towards keeping posted in our business. We never look for a bonanza, no matter how loudly puffed the alleged novelty may be. We take it easy, keep our temper and make a note of it."

There are many of our readers who feel too poor to invest their hard earnings in the high-priced novelties every year announced. Too often, it is true, the "novelties" prove to be old things with new and taking names; too often, even if new, they prove to be inferior to old kinds. Nevertheless we must say that in the long run, view it which way you will—as a matter of profit or instruction or both—novelty-testing has amply repaid us.

PREPARING FOR BATTLE.

IT is very evident that the battle for and against oleomargarine is to be fought over again in the next Congress. Last Saturday, a large meeting of stockmen at St. Louis unanimously adopted resolutions declaring that the wholesale dealers' license of $480, and the retail dealers' license of $48, are exorbitant, and that the tax of two cents per pound on the concoction meets all requirements and objects of the law and fully protects the agricultural classes. They stated that the manufacture of oleomargarine enhances the value of cattle from $2 to $4, and of hogs from 13 to 15 cents per head, and urged "all friends of the cattle interests" to memorialize Congress "for a reduction of the special licenses and for a repeal of all the obnoxious prohibitory and monopolistic features of the oleomargarine bill."

A memorial to Congress was drafted and signed by a large number of commission merchants and exchanges, and some citizens "setting forth the objectionable features of the Oleomargarine Bill and the bad effects they have had," and particularly praying that the special licenses be reduced. This is part of a general movement by the olea men. Similar "protests and petitions" are to be sent to Congress from other quarters. Large invested interests are terribly persistent in seeking their selfish ends, and the oleo interest has always been among the most unscrupulous in this way. The supporters of genuine butter and honest dealing, too, find several defects in the bill already passed, and it is very likely they will seek in the next session of Congress the amendments which experience may show to be necessary to render the law more effective. The final issue must rest with the farmers of the country, but they must remember that they are fighting against a watchful, powerful and deeply interested foe, always ready to take advantage of any remissness or blunder on their side. If the oleo men seek in any way to lessen the stringency of the present law, it is very likely they will be like the party who went out for wool and came home shorn.

A SOUTHERN AGRICULTURAL COLLEGE.

THE farmers of South Carolina want an agricultural college. What is more they propose to demand one and to make the the kind of college they want. It's a most encouraging evidence of progress in the right direction that the following sentiments were loudly applauded at the late Farmers' meeting in Columbia:

"What we want to guard against is allowing the board of agriculture and the college being made an asylum for broken-down politicians and old superannuated Bourbon aristocrats, who are thoroughly incompetent, who worship the past, and are incapable of progress of any sort, but who boldly assume to govern us by divine right and are ever ready to put in their claims to fill every position of honor or profit that may offer. These people are the bane of our State, and not knowing how to lead, are riding us like "Sinbad's old man of the sea." If they are to get control of our agricultural college we had best not found one, for they will select its professors from among their kindred and friends, and the school will fail most miserably to fulfill our hopes and expectations."

Let the farmers of South Carolina stick to these sentiments, and they will yet have a college to be proud of. It was proposed at the above mentioned meeting to permit the various counties of the State to bid for the location of the college. In this way the farm could be obtained at a very small cost. It was estimated that the institution could be run at a cost of $30,000 per year if it could be "kept out of the hands of politicians and broken-down gentlemen." With the present privilege tax on fertilizers and the income from the land-script fund applied to the maintainance of the college, the State would have but little to pay for its support. It is proposed to place the control of the college in the hands of a Board to be elected by State conventions of farmers. In this way politicians will have nothing to do with it, while the Granges and other farmers' organizations will control it in every way. We wish the farmers of South Carolina God speed in their work. They have all the mistakes and experiments of the past to aid them, and in no part of the country can the ideal agricultural college be made to accomplish more real good.

BREVITIES.

THIS is the first trial week of the supercalendered paper. Readers will please observe. After three or four weeks we shall use the heavier machine-calendered paper. *Then* our subscribers, those who care about it, are to vote which they prefer.

IT is doubtful if the cost of what seems to be a trifling improvement in a journal like the R. N.-Y. is adequately considered by most readers. For instance, if the supercalendered paper be elected, the extra cost will be precisely $2.50 per thousand copies each week, without adding the increased postal expenses.

WE have succeeded in rooting a fair proportion of grape-vine cuttings by merely burying the cuttings in mellow soil and covering them with litter or coarse manure. Let the upper bud of the cutting be placed level with the soil. Compact the soil firmly about the lower bud. Some varieties will not strike in this way.

MR. WM. E. GREEN, of Vermont, the originator of the Vergennes grape, died last month. Mr. Green was considered one of the best judges of cattle and fruit in Vermont. He was frequently called to Montreal to act as judge at the fairs. A new grape, the Early Vermont, considered by good judges superior to the Vergennes, was originated by Mr Green, but has never been introduced.

CALIFORNIA Arbor Day was appointed for November 27. This was a poor selection. The day comes at the wrong season for tree planting. Even in "sunny" California there are seasons and seasons. There is a practical side to forestry that must not be overlooked by enthusiasts. The tree planter is the parent of the forest, and he should always be deferred to. The State Forestry Commission of California hope to have Arbor Day named for some date in February.

THE Connecticut Board of Agriculture will hold a meeting at Torrington, Conn., December 14–16. An excellent programme has been arranged, including papers from such men as P. M. Augur, Professor S. W. Johnson, Professor Brewer, John E. Russell and others. These farmers' meetings have done a vast amount of good. Connecticut is too small a State to hold all the good they can bring about. It spreads out all over the country. The farmer who goes to this meeting will secure material enough to keep his brain busy for the next year.

THERE are very few desirable shrubs that will grow close to a house and thrive under its sheltering eaves. Nothing that we know of is so well adapted for this purpose as the Upright or Bush Honeysuckles, such as Lonicera fragrantissima, hispida, Standishii, etc., to be found in the catalogues of most nurserymen. Their leaves are retained quite fresh and green until nearly January. Their flowers are fragrant, and by annual pruning the bushes assume as compact a form as may be desired.

THE Royal Agricultural Society of England propose a horse-shoeing competition at their coming agricultural shows. At past exhibitions of this kind too much has been allowed for quickness in shoeing. There has been a tendency to do hasty work rather than to show how shoes ought to be put on. The cases where a shoe must be put on in a great hurry are comparatively few beside those where the shoe is to stay on the horse's foot for long and active service. Speed is desirable, but excellence in workmanship is best of all. In view of the paramount importance of sound feet in the horse and of the injury frequently done by unskillful shoeing, every encouragement should be given to improvements in farriery.

A. L. PENNOCK & SON, of Lansdowne, Pa., are sending out a circular on the merits of what they call the "Melon Pear," a name rather misleading. It is possible that the above firm is not aware that this is a very old plant—an egg plant indeed—known in England since 1597. Gray's Garden Botany (page 230) calls it an egg plant. Vilmorin catalogues it as an egg plant. Its botanical name is Solanum Melongena. This Mr. Pennock gives. We are not presuming that he intends to deceive anybody in his circular. In fact, the firm expressly states that they have not fruited it. But it would have been well to do so before issuing the circular.

IT looks as though the successful Farmers' Institutes of the Winter are going to be those under the direction of a regular manager, who makes it his business to see that the programmes are arranged and carried out. A good appropriation is needed to start these institutes as they should be started. There is enough good to be accomplished at these meetings to make it worth while to pay a man well to look after them and give his whole time to the work. There ought to be a rousing meeting held in every county of New York State this Winter, but who has heard of any movement towards such a result? We believe in Farmers' Institutes. They pay well. They can't be carried on for nothing, and State Boards of Agriculture can't go to sleep and dream them.

SICKNESS and death frequently enter the system through the feet. Fashion has killed hundreds, but its victims grow fewer. It is more in the style now to wear warmer clothing about the chest and to permit more play for the lungs. People have the hardest work to get over the idea that small feet are an evidence of breeding. The tendency still is towards the thinnest of shoes and stockings. These coming directly against the cold pavements of the city cause many a case of pneumonia that might have been avoided. To the credit of farmers and their families be it said that they have far less of this absurd veneration for small feet, yet there are many who dislike to wear shoes large enough to permit of proper foot covering or who would rather have their feet dampened than be seen wearing an overshoe. Such a feeling is all nonsense. Comfort and health should always be consulted first of all. Money spent for warm and comfortable foot coverings is well spent.

The Herdsman.

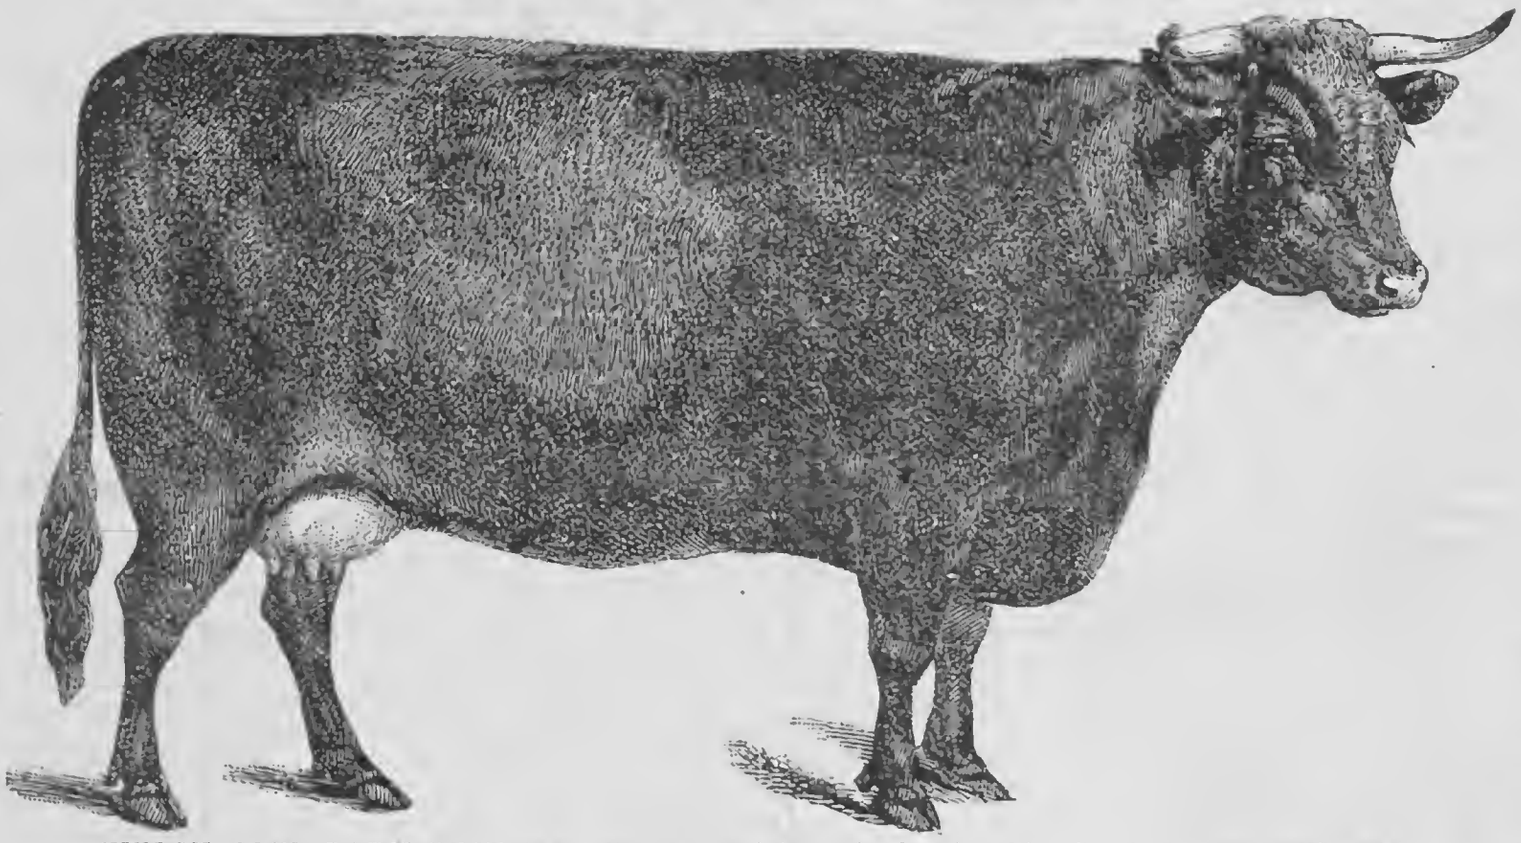
OUR ANIMAL PORTRAITS.

WELSH COW LADY BEST, 236.

Less than 50 years ago the Glamorgan cattle were probably the most numerous in Wales; but it is a question now whether any survive in their purity, as they seem to have entirely disappeared before the advance of the Short-horn, Hereford and Devon. They were excellent milkers and their flesh was considered of superior quality. The Pembroke or Castlemartin cattle still flourish, however, as a distinct breed, although they are hard-pressed by English rivals, chiefly the Short-horns. They are fairly good milkers—as good, it is said, as most of the improved breeds, and both in texture and quality their meat is of a superior kind. As a rule, they are black in color, though a few have a brown tinge and sometimes a little white appears on the face and udders. About a dozen years ago a herd book of the breed was established, and a patriotic effort has been made to perpetuate the race.

The Anglesea cattle claiming to be a distinct breed, very closely resemble the Pembrokes. They are of blacker color, and a trifle larger. They have been raised chiefly for beef, and their milking qualities have therefore been greatly neglected, and consequently they are of little use in the dairy: but their flesh is of excellent quality, and considerable numbers of them are finished off in England for the London market. A herd book has also been established for these of late under the name of the North Wales Black Cattle Herd Book, and as they are extremely hardy, and thrive on the scanty mountain pastures on which most English breeds would starve, it is likely that they will long survive the other native cattle of the Principality. At Fig. 454 is an illustration of a fine cow of this breed—Lady Best, No. 236, Vol. II. of the North Wales Black Cattle Herd-Book. She has been during the past year a frequent prize winner among Welsh cattle both in England and Wales, and inherits, according to the (London) Live Stock Journal, from which the illustration has been re-engraved, "the purest blood of pedigree Welsh cattle."

A breed to be profitable and, therefore, popular among the farmers and dairymen of England must be good for both beef and milk — hence the transcendant popularity of the Short-horns.



WELSH COW, LADY BEST 236. Re-engraved from the London Live Stock Journal. Fig. 454.

PRINCIPLES OF BREEDING.

PROFESSOR G. E. MORROW.

In-breeding is the breeding together of animals closely related. Close-breeding and line-breeding have somewhat the same meaning; the latter referring to breeding from animals of the same family or tribe. Cross-breeding is the breeding of animals of different breeds, families or strains.

The general opinion is that close in-breeding is not advisable; while many stockmen favor cross-breeding. Only related animals will probably possess many of the same characteristics. Breeding them together will intensify these characteristics. If the animals possessed any good qualities, it might be the wisest course to practice in breeding; but as they also have undesirable qualities, or tendencies, which will be made more certain to appear by such breeding, it is rarely safe to continue the practice of breeding from near relatives. In establishing a breed this practice is more allowable; sometimes necessary.

Cross-breeding often breaks up the established characteristics of the breeds or families, but frequently gives animals of exceptionally great vigor. For the production of animals for labor, meat, milk, etc., reasonable cross-breeding is often satisfactory in its results, although it is rarely well to make violent crosses. Obviously there is less certainty of the reappearance of characteristics possessed by cross-bred animals. It also seems certain that breeding from such animals more frequently causes reversion, or atavism, than when the parents belong to the same breed or family. Crossing for the mere sake of crossing, or without a definite object in view, is unwise. The safer rule, in the large majority of cases, is to continue to breed from animals of one breed, avoiding close relationship. Certain qualities are directly opposed to each other; others are closely related; still others seem to have no connection. Even in the latter cases it is exceedingly difficult to secure a high degree of excellence in several different characteristics in the same animal. The breeder must usually be content to accept comparative weakness in some qualities as the accompaniment of very remarkable development in others. Fortunately a fair development in a number of qualities may be secured.

The great majority of farmers will do most wisely to attempt the production of animals of good general merit, rather than those of wonderful excellence in any one point.

It is a great mistake to multiply qualities of little importance in themselves, but which are insisted on in the selection of breeding stock. Qualities of little importance in themselves may become important as evidence of purity of breed and the possession of important characteristics which cannot be seen, but only injury comes from needless multiplication of such characteristics as tests of breed or fashion.

University, Champaign, Ill.

STOCK CONSIDERATIONS.

It is a trifle curious that the London Smithfield Club has not yet been able to decide whether to offer prizes for the best dead carcasses of beef—male and female—at its great annual fat stock show before Christmas. Such prizes have been offered at our Chicago fat stock show for years; but John Bull is very conservative in adopting foreign practices, however obviously advantageous. Why should not prizes be also offered for the best carcasses of sheep, swine, and even poultry? The Club has yet advanced only as far as the consideration of offering prizes for the best beef carcasses. Entries for the exhibition number 491, and the prizes aggregate $17,330.

SHUTTING OUT CONTAGIOUS STOCK DISEASES.

Sweden is now the only country in Europe whence live stock of all kinds are permitted to land in England without being subject to slaughter immediately after debarkation, as that is the only country free from contagious live stock diseases. Denmark is free as regards cattle and sheep; but swine from that quarter must be slaughtered at the port of landing. A recent Order of Council prohibits the landing of cattle from Norway except for slaughter. At the recent meetings of stockmen and veterinarians at Chicago, the opinion was very generally and strongly expressed that the best American policy would be to prohibit the importation of cattle from any country in which contagious cattle diseases exist. Cattle from such countries are now admitted for breeding purposes subject to a quarantine of 90 days; but in view of the danger of introducing disastrous contagious diseases in spite of this precaution, often badly enforced, it is generally considered the wiser course to suspend importation of cattle altogether for breeding purposes from such countries during the prevalence of disease there. In doing this we would be merely enforcing against Europe the same rule Europe is enforcing against us.

THE CHAMPION HEIFER.

Mrs. Burchard, the inspector of the Holstein-Friesian Association, recently tested the heifer Netherland Princess 4th, 16475. This test, so far as we can learn, was fair in every particular, and stamps the heifer as the most remarkable animal of the same age in any breed. Netherland Princess 4th is a two-year-old daughter of Netherland Prince, and really of the same blood as himself, being from Netherland Princess, his full sister. She was dropped June 28, 1884, and at the date of her test was two years four months and five days old. Her first calf was dropped on Sept. 20 last. In the seven days of her test she gave 282 pounds 10 ounces of milk, which made 20 pounds 3½ ounces of superior butter. It required 13.97 pounds of milk to make a pound of butter. The dairy feed from which this butter was made consisted of 17½ pounds of a grain ration, consisting of two parts wheat bran, two parts corn meal and one part oatmeal; 26 pounds of corn silage and 25 pounds of hay—mixed clover and Timothy. She was watered twice a day—all she would drink. Netherland Dorinda 6804 gave in one week 323 pounds 3 ounces of milk, and 22 pounds of butter. Netherland Baroness 2535 gave in two days six pounds 4¾ ounces of butter, and Netherland Peeress 2640 gave, in five days, 14 pounds 1½ ounce of butter. All of the cows are closely related to Netherland Prince. They are all owned by Messrs Smiths, Powell & Lamb, of Syracuse, N. Y., who have reason to be proud of the Netherland family.

Pure-bred Bulls for Farmers.—The directors of the Irish Cattle Trade Association are taking active measures to improve Irish stock. It is now proposed to raise a sum of money with which to procure pure-bred bulls of good breeding for public use. These are to be placed in communities where scrub bulls abound, and the service fees will be put down so low that no farmer will drive his cows to a scrub bull just to save a little money. This plan of scrub fighting seems like a good one. The association will make no money by placing these bulls about, but they will improve the stock where it could not otherwise be improved.

Working Cows.—I have seen cows worked like oxen. Some men, just starting in and trying to get a farm, used to work cows with success. Working cows don't give much milk to be sure; but in early days there was not so much sale for milk and butter. By having quite a number of cows to take turns and thus make lighter work, and feeding extra meal, I don't see why this plan wouldn't work well in some parts of the country even now.

Brandon, Vt. E. F. E.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

THE DEATH OF THE YEAR.

A cloud came out of the golden west,
A bell rang over the silent air;
The sun-cloud hurried away to rest,
Flushing with kisses each cloud he prest,
And, Oh! but the day was fair.

"How brightly the year goes out," they said:
"The glow of the sunset lingers long,
Knowing the year will be over and dead,
Its sad hours over—its fleet hours fled—
With service of even-song."

"How sadly the year came in," they said,
I listened and wondered in dusk of night;
To me no year that might come instead
Of the old friend numbered among the dead
Could ever be half so bright.

The sun-kissed clouds grew pale and gray,
The bells hung silent in high mid-air,
Waiting to ring the year away
In strains that were ever too glad and gay
For me—as I listened there.

Oh, hearts! that beat in a million breasts,
Oh, lips! that utter the same old phrase,
I wonder that never a sorrow rests
In words you utter to friends and guests
In the new year's strange, new days!

Is it just the same as it used to be?
Have new years only a gladder sound?
For ever and always it seems to me
That no new face can be sweet to see
As the old ones we have found.

There is no cloud in the darkened west,
The bell is silent in misty air,
The year has gone to its last long rest,
And I, who loved and who knew it best,
Shall meet it—God knows where!

—*All the Year Round.*

OF INTEREST TO WOMEN.

The Mayor of New York has appointed two women as School Commissioners, Miss Grace Dodge and Dr. Mary Nash Agnew. It is very probable that the precedent thus established will be followed in other cities.

Sister Dora, who gave her life to good works among the miners of the English "Black Country," has been honored by a statue at Walsall. It is of heroic size, and represents her in the dress of her order with a roll of lint in her hand. This is the first statue erected in England to any woman not of royal blood.

Some of the New York papers are now daily harrowing their readers with accounts of the fearful privations of women in the humbler ranks of seamstresses. It is the old, old Song of the Shirt, with the modern addition of a sewing machine. But, with deepest sympathy for these unfortunates, theirs is a mistaken labor. All over the country are cries for better and more intelligent workers in domestic service; why should the underpaid seamstreses work day and night, ill-housed and ill-fed, when they would be well paid and well cared for in such positions?

A pretty Christmas gift for the baby will be a crib comforter. It may be made of cheese-cloth tufted with pale blue wool. Around the edge may be feather stitching of the wool, finished by a frill of lace. Another useful gift is a drying blanket made of a width—doubled—of fine, white canton flannel. This is to be spread over the lap while baby is being washed and dressed. The edge is scalloped and buttonholed with colored wool. It is tufted together like a comforter.

CONFESSIONS OF A COUNTRY GIRL.

II.

A study of the floating literature of our time would give the impression that womankind was a newly discovered genus of singular and conflicting characteristics. Every writer of the superior sex has something to say about our characteristics, and he says his little say with the calmly curious air he would display in discussing the moral qualities of the Fantees. This is highly edifying, especially to the women. I suppose we are a singular and inconsistent sex, but even our inconsistencies are not without their value. Of all classes, I really believe that farmers' wives and daughters receive the greatest amount of preaching in the course of the year. We learn all sorts of things about our ways that we never thought of before. We learn that we are ignorant and narrow-minded from one source; that our culture and liberality makes us a credit to the nation from another. One authority compares our fine physique with the over-worked European women; another says that we never have any figure worth mentioning, and that our complexions show the work of the deadly frying-pan and the insidious soda biscuit. And so on, through a whole catalogue of virtues and faults, until we can only conclude that neither of these eminent authorities really know anything about the matter.

We girls ought to become a vastly different generation from our mothers, if we only read, mark, learn and inwardly digest all this good advice. But there is one fault a recent writer pointed out, whether the result of all this dissection of woman's ways I cannot say. That is, the apparent prevailing discontent among women. Wives and mothers complain of their increasing work; young women complain of the sordid monotony of their lives. These trials are true enough, we all know, to our sorrow, but are we not aggravating them by the view we take? We need not assert with melancholy emphasis, that man is made to mourn, and take everything that comes with a sad equanimity. We must cultivate the sunshine on our hearts—what the French call *gaiete de coeur*, as a recent writer in this department said. A great deal of discontent seems to be caused by an aimless life. Of course the woman with half-a-dozen babies and no hired help has all the aim in life she needs, if she only

looks at it that way. But it is the young girl who often feels this want of purpose. She may have regular duties, but possessing all the vague hopes of girlhood, she wants to do something or be something, out of the every-day rut. She becomes dissatisfied with commonplace duties, and, if her fairy prince does not appear, she drifts into discontented old-maidism. What is the remedy? This is hard to say. Perhaps the best thing would be to give every girl an aim and purpose, apart from marriage; to teach her that wifehood is an honorable estate, but not to be entered merely for want of ability to care for herself. Self-respecting independence will not make us girls "strong-minded" in the common acceptance of the term, nor need it make any womanly woman contemptuous of loving domesticity; it will simply give the ability to fight their own battles to those who need it. So find the work you are best fitted for, and then, whatever your hand finds to do, do it with all your might; it will not make life all sunshine, but it will prevent many a dark hour, and give something more to live for, in any case. PATTY GARTON.

A PROTEST.

I WANT to say a word in behalf of the wash-women. If "cleanliness is next to godliness," surely her station is a valuable one."

Now I never went out or took in washing, but I have a neighbor who comes and helps me over hard places, house-cleaning, washing, etc.

I should no more think of offering her old carpets or surplus fruit for pay than I would to a photographer for his pictures. I pay her cash, and give her the apples.

If the laboring class are to be paid in second-hand articles, it is no wonder they revolt.

To whom do you think it will be said, "Well done, thou good and faithful servant"—the girl, with her soulless pictures, the faithful house-keeper, or the despised wash-woman?

M. S. HILL.

TYPE-WRITING OR DISH-WASHING.

IF "Eleanor Kirk's" excellent article in the RURAL of November 6, has not convinced "wife, mother, and housekeeper" that a woman's whole duty is not bounded by wash-day on one hand and baking-day on the other, it is most unlikely that any humble words of mine, however earnest, will do so. That every woman who is married, or who contemplates matrimony, should be able to cook and wisely conduct her household, I am sure no one will deny, but it is quite as essential that she should also have some trade, profession, or vocation by which, in case of need, she can support her family. Husbands are mortal! "He left a wife and four children in destitute circumstances," is a phrase that may be seen, with variations as to the number of children, in almost any and every daily paper. Saddest of all, not every man who marries is able or willing to support a wife. In either of the above-mentioned contingencies, what is a woman to do whose sole knowledge consists in making a good loaf of bread. She cannot turn this accomplishment, albeit a very desirable one, to any pecuniary use, inasmuch as cooks with several children are not appreciated in ordinary kitchens.

I once knew a charming little lady, daintily reared in a southern family of wealth, who had never been allowed to button her own shoes, or dress her own hair. She married, as many women do without the least elementary knowledge of housekeeping, and went with her husband to a new settlement in southern California. Help was scarce, and when it could be obtained was rather a hindrance than a help. Many a laugh that almost ended in tears, so closely did her tale border on the tragic, have I had over her recitals of her experience in those days. On one occasion coming home from church to find the cook in a drunken stupor, and that the nurse and housemaid had taken French leave, she heroically assured her husband that she would get him just such a dinner as he liked.

Having settled upon a meat pie and hot biscuits as the best that could be done under the circumstances, she hastened to the kitchen and proceeded to make the dough for the latter. Remembering to have heard that bread was the better for long kneeding, she rashly concluded that the same rule would apply to biscuits, and patiently kneeded them for half an hour, molded and put them in the oven; sliced her potatoes and onions in a dish with layers of meat, filled the dish with water, covered it with a crust rolled from some of the biscuit dough, and triumphantly placed it in the oven to bake. When the biscuits were done she was somewhat dismayed by their leaden looks, but the tempting brown of the meat pie seemed to atone. To this day she declares that whenever she thinks of that pie with its unwarmed meat, and raw potatoes and onions, she experiences anew the mortification of that dinner.

She began at once, 'like' the brave' little woman she was, to remedy the defects of her education, and became in time a most accomplished cook, although she has assured me that she always disliked it extremely and found it the most terrible drudgery. A proof that all women are not born cooks. When a year or two later her husband lost all his money in an unfortunate speculation, and his health at the same time, this little woman, although she could not make "boots and shoes," could and did by means of her pen, support her husband and two children, going to a large city to obtain work. Since her husband's death, she has gone bravely on, sent her son through the University of California (which is free except for board), and educated her daughter, who, contrary to all laws of inheritance, is a natural cook, and never so happy as when with her pretty arms bared, she is concocting some delightful dish.

I know twenty women to-day who but for their knowledge of short-hand and type-writing would be in indigent circumstances. I know another lady, who as editress of a well-known magazine makes three times the money that enables her to pay a good housekeeper to take from her hands the duties that are so irksome and for which she is so unfitted.

It is not a question of "easier times," it is one of doing with our might that for which we are most fitted, and I would say to "wife, mother and housekeeper," beware how you check the tendencies of your daughter should she attempt to leave the old beaten track. Although she may not like to get up and build the fire on a cold winter morning, for a man selfish enough to let her do it, being the daughter of so industrious a mother, she is not likely to be a drone in life.

I am, dear readers of the RURAL, one who has been a housekeeper, and is still, a

WIFE AND MOTHER.

TEACHING THE YOUNG IDEA.

AN exchange gives expression to the fear that when ladies are once generally admitted to the Boards of Education, they will, as far as their power goes, employ only female teachers. Whether this would be so or not, it certainly would be better for the rising generation that it should be so. Women have more power than men in forming character in children. The moral, intellectual and spiritual powers are better evolved and developed by the coaxing influence of affection and sympathy possessed by women, than by the repellant severity of the average male teacher.

As a general thing a man fills a post as teacher only as a stepping stone to something else, to work his way through college for instance. It is a woman's life work. A very small per cent. of lady teachers marry, and of those who do, many of them continue their teaching.

There is one crying shame that might be avoided if women could take a place on Boards of Education. They would see that a female teacher who did her work in every way as well as a male teacher should receive the same salary. SELMA CLARE.

GOLDEN GRAINS.

DRYDEN said: "Let grace and goodness be the principal loadstone of thy affections. For love which hath ends will have an end, whereas that which is founded on true virtue will always continue."....

PROFESSOR PHELPS says: "Take Christ out of the Old Testament and the student of astronomy may well scorn and scout the whole story. Put back Christ into its pages, and they glow with a magnificence which the Heaven of Heavens cannot contain. Pretty, is it? That very homeliness of details is the measure of God's condescension. That he has come down to the slow and patient training of a rude person in a ruder age. Is the prattle of the nursery degrading to the young mother who fondly studies its meaning? What else marks the love of a mother like it? But for just such pettiness what would the world have ever known of Homer and Plato? The Old Testament is simply the story of the moral nursery of the race. In the one fact lies the whole volume of reply to the carpings of infidelity."..... .....

Go on in your journey to Heaven, and be content with such fare by the way as Christ and His followers have had before you: for they had always the wind on their faces; and the Lord hath not changed the way to us, for our ease, but will have us follow our sweet guide.... ....

BE useful where thou livest, that they may
Both want and wish thy living presence still;
Kindness, good parts, great places are the way
To compass this. Find out men's wants and will,
And meet them there. All worldly joys go less
To the one joy of doing kindnesses.

—*Geo. Herbert.*

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

Pleasant evenings in the sitting-room of the farm house. How can we secure them? Music, vocal or instrumental, or both, will help. A game or so, a story or lively conversation will also help. But underlying these we must have contentment.

HOUSEKEEPING IN NEW ENGLAND.

I.

MARY WAGER-FISHER.

WE had an "outing" of six weeks last August and September on the Massachusetts coast, beginning with Boston, jaunting leisurely southward as fancy led us, and seeing a good deal of Yankee life in a variety of places—very superficially, it is true, but perhaps more interesting than a deeper acquaintance would have proved to be. Most of the housekeeping was in hotels. In one, where the rates were four dollars per day, the tablecloth was soiled, and in another, where the charge was two dollars a day, and the best hotel in the place, all the tables were covered with white oil-cloth kept spotlessly clean, and I liked that much better.

On Sunday mornings we invariably had for breakfast baked beans, Boston brown bread and codfish balls! In one very quiet and home-like hotel where we stopped for three weeks, and where we had fresh bed linen twice a week and stacks of clean towels (the woman who did the washing and ironing was Scotch; she had the sweetest voice and smile of any woman I have seen in six months, and her demeanor was that of a bred lady), the brown bread was so exceptionally good, that I asked the landlady how it was made, and she said:

"Rye flour three cups, corn meal three cups; put in mixing pan. Add one-half cup of molasses, one teaspoon of soda, put in one quart of cold water, one teaspoon of salt. Mix and steam three hours. If you have no brown bread pan you can put it in a lard pail of suitable size."

The baker in this house was a superior workman in every branch of bread and pastry making. He was a German and had learned to make bread in Germany, but he had learned to make pies in Yankeeland, as Germany is not the home of the pie. His pastry was excellent, and although I don't approve of pie and consider it a sort of culinary abomination, still, when the dining-room girl would come to our little table daily with "What will you have for dessert? Mince, apple, blueberry, custard, Washington-and squash pie and ice cream," I was often inveigled into ordering pie! And everywhere we went pie abounded, and one mature waitress said that she had all her life lived in New England and she had never been anywhere they didn't have pie—they didn't generally think fruit was good for much except it was turned into pie!

One day I went in to see the German baker at work—clad all in white like a Chinese house servant, and with a white turban on his head. He worked like a flash. He was moulding bread—putting the loaves in a long pan, with a wide space between each loaf; with a wide camels-hair brush such as artists call a "blender" he gave each one a coating of egg well beaten, then covered them—each separately—with a long narrow bake tin. Under these hoods the bread rose for the last time, and was baked—the covers being removed only when the bread was nearly done, so that a fine crisp crust would be formed entirely over each loaf. He used the Vienna yeast because he said that he hadn't time to make his own,—he used half milk and half water in mixing the dough. Every day a "shore dinner" was served for such as preferred it to a "roast." It consisted of clam chowder, blue fish boiled or baked, clam fritters, vegetables, etc. Fish was always abundant. It was no uncommon thing to see half a hundred boats at anchor fishing for mackerel and many others out with a trap for catching lobsters—a cage-like arrangement called a lobster pot into which the lobsters are beguiled by bait, and although slipping easily in cannot get out—much on the plan of some mouse traps.

One day we went in a whaler across Massachusetts Bay to the tip end of Cape Cod, where we ate fresh codfish, and saw fishermen unloading cod from the boats just in from the "Great Banks" of Newfoundland. The fish are caught with a hook and line, cut open, washed and salted in the hold of the vessels, the hold packed full of them. In unloading and preparing them for market, they were pitched out with a pitchfork and washed off in a large canoe filled with fresh water, then packed in casks, and the work was done in a cleanly manner. The livers of the cod are thrown in casks where the oil exudes spontaneously—the meaty part of the liver and other impurities rising to the top, leaving the oil "crystal pure." One of the men lifted the lid of a liver cask, and the smell was too vile for a moment's endurance—quite equalling the taste, which is the worst of anything I ever tasted, and I once swallowed in the course of time a gallon, more or less!

When on the island of Nantucket we ate sword-fish which Anaximander thought capitally good—considering it was not Delaware shad, which to his palate is the finest fish in the world. It is only recently that sword-fish has been considered good for the table and the tremendous weapon it carries projecting straight out from its head would seem to constitute it a veritable monster. The laddie paid half a dollar for a sword in its natural condition as taken off the fish's head. The surface is hard and rough like a grindstone and much the same in color—the length 38½ inches and the circumference at the big end ten inches. One of the sailors on board the whaler showed us the gun they used in shooting whales—a short, very heavy iron gun with an inch bore—the load a shell about a foot long which explodes inside the whale and serves to make him feel sick. This shell is bought already prepared and costs $3. After the whale has experienced the astonishing sensation of this internal explosion, he is harpooned, a rope is tied to the harpoon, an anchor tied to the rope and a buoy to the anchor: in three days the whale will float and may be then towed into port. The whale is one of the most fortunate of creatures for he lives to be a thousand years old and nobody knows how much longer. In that length of time he accumulates an immense quantity of oil which at one epoch went a long way in enlightening the world But the discovery of petroleum practically put an end to whale oil for illuminating purposes and was almost the death blow to New England whale fishery. It is no longer considered profitable and whalers in large numbers have turned to other sources of industry.

To have stiff shirts and collars add powdered borax to the boiled starch—half a teaspoonful to a quart.

ONE WINTER.

ANNE THRIFTY.

ONE evening in early December, as the twilight deepened, I was sitting in the big rocking chair, with Sammie and Bertie both on my lap. The glow that shown through the mica doors of the stove was our only light, and surrounded by dusky shadows we were building a story about a wonderful little boy, who, after leading a very ordinary life until he was nine years old (our heroes always had to be about the same age as the twins), suddenly in response to an uttered wish found himself changed into India-rubber. As I wove the story, the boys contributed to it, by interrupting me at every breath with suggestive questions such as: "Could he reach a mile with his rubber arms?" "Could he eat *a whole bushel* of candy?" with great emphasis on a whole bushel. "Could he stretch his eyes very big?" "Could he hear better when his ears were stretched?" To all these questions I must reply with some wonderful experiences our hero had gone through. As we sat there laughing over our story, with the faint light from the fire around us, I wondered whether any one would think of us as poor if he could look in through the window.

Aunt Helen with little means at her command had made her house so home-like that it seemed beautiful to me.

The house was new, and although built to rent, it had been nicely finished inside, and the windows were large and low with only two large panes of glass in each sash. Aunt Helen had selected the paper for the wall in the sitting-room to harmonize with the carpet which was green and black. The extension-table closed, and covered with a red tablecloth, stood in the center of the room holding books and papers; pictures, drawn in colored crayon by Auntie when a school-girl, hung on the walls in both sitting-room and kitchen.

Everything had been cared for and kept at its best as long as possible, and whenever I swept, dusted and arranged they were an object lesson to me in housewifely art.

I found it hard to realize that Aunt Helen would never come back to her little home, and whenever I attempted any task that was new to me, I found myself involuntarily looking down the street, whence Aunt Helen had so often come from shopping or other errands expecting to see her and consult her about my work.

What an empty, heart-breaking void is always left when the mother never comes back. When the boys felt lonely how helpless I used to feel to supply to them the mother love they had lost, and when Uncle John looked careworn and sad, the desolation that death makes would fill the house and sadden us all,

so he would put aside his sorrow and trouble as much as he could to brighten things for us.

When our story of the wonderful India-rubber boy was ended, we lighted the lamp and went to the kitchen to get ready the supper by six o'clock. Potato soup, cold corn-bread, butter and molasses were to make up our meal, hardly nutritious enough for a hard-working man and growing boys, and our supply of milk was getting a little short now too, so we used it only for the breakfasts.

When Uncle John's step came up our short plank walk, supper was waiting for him. As we sat down to the table, he threw the mittens he had just taken off into my lap, saying, "I'm ashamed to ask you to mend them again, Annie; but what is a poor fellow like me to do when his mittens wear out but to bring them to the good fairy with a magic wand that looks to me like a darning-needle?" "You shall have them to-morrow, sir, as good as new," I replied, but when I prepared to mend them after the dishes were done, it proved impossible to make the darns look well, and I adopted another plan to fulfill my promise. Using Uncle John's hand, to draw the outline of a mitten, I cut a pair out of a piece of strong, brown cotton flannel I found in the piece-box. There were only two pieces in each mitten, the seam following the outline of the hand and thumb. I cut them larger than the drawing to allow for the thickness of the hand, and because the goods would not stretch as a crocheted mitten does. After sewing them up firmly with the soft side in, I cut an opening in each cuff, as in the wrist of a kid glove, bound the cuffs and openings, and finished them with two buttons and buttonholes in each. The last stitches were put in before bedtime. Uncle said they were the warmest mittens he had ever worn, as he pulled them off and held them up admiringly the next evening upon his return from work. A regular pattern with the thumb separate from the hand, and cut for "rights" and "lefts," makes perhaps a more workmanlike mitten, but it is no more comfortable, and is very troublesome to make. To save their school mittens, I made each of the boys a pair of the same kind to wear at their work and play when at home.

HOME-MADE CANDY FOR THE HOLIDAYS.

CHOCOLATE CREAM DROPS.

PUT the chocolate—grated—on the stove to steam for an hour. While this is preparing, boil the sugar—best granulated—in the proportion of one cup of sugar to one-third of a cup of hot water; flavor and boil till when a little is dropped in cold water the particles readily adhere together like wax. Take from the fire, stir briskly till it loses its transparency, and is cool enough to handle. Mould into tiny balls with the hands, lay on buttered paper, and set in a cool place for awhile to harden; then dip each ball in the melted chocolate, lay on buttered paper and again set away to harden the coating. To keep the chocolate hot enough to run freely when off the fire, set the dish containing it in another of hot water. One-half bar of Baker's pure chocolate, and two large coffee-cupfuls of sugar will make 100 "drops."

MINT BUTTONS.

THE easiest way for unskilled hands is to mix confectioners' sugar with the white of eggs, and flavoring until stiff enough to roll out with a rolling pin in a rather thin sheet, then cut "buttons" with a thimble and harden in a cool place. A pretty way is to make peppermint candies white; wintergreen pink, by adding a pinch of red sugar to the egg before mixing with white sugar; and lemon candies yellow, by mixing with the yelk of an egg. The white of a large egg will require about a pound of sugar. These candies can be made better by boiling granulated sugar, but it takes practice and infinite patience.

FOR NUT CANDY.

THE proportions are one cup of sugar to one-half cup of hot water. Boil till brittle when a bit is dropped in cold water. Then throw in broken meats of any nuts preferred; pour in a shallow buttered dish, crease deeply in squares while warm with a sharp knife, and when quite cold it will break in these lines. Do not stir this candy, at any stage of preparation if you want it "clear as glass."

I hope everyone who tries these recipes will have as much fun in making, eating, and giving away these home-made candies as we do.

MISS. E. BECKER.

HOME-MADE WARDROBE.

THE usefulness and comfort of a sleeping-room that is destitute of a closet will be very much increased by one of the following contrivances. Take a pine board four feet long and 18 inches wide, and have it fastened to the wall about six feet from the floor and just where the wardrobe, if you had one, would stand. Have a strip to which clothes hooks have been fastened nailed against the wall under the shelf, and another half way down for the children's clothes. Screw hooks on the under side of the shelf also. Hang curtains of pretty, bright cretonne around the shelf with a ruffle at the top. If preferred a triangular one can be made in the corner of a room.

HOUSEKEEPER.

BREAD.

GRACE GREENWOOD truly says that there is something "sacred" about bread; more so than about any other article of food which we place upon the table. Doubtless the "Give us this day our daily bread," has had much to do with ingrafting into our nature this feeling of reverence. No food calls forth such compliments as good bread and no other is so noticeable as bad bread. To excel in the line of bread-making is no light task, and the young lady who knows all its details has a fortune at her finger tips. There is a rare delight in being able to prepare and cook juicy roasts, delicate cakes, refreshing salads and quivering jellies, but above all these is the homely art of producing sweet, light loaves of bread, snowy biscuits and brown rusks. The wealthy housekeeper whose caterer supplies her dining table, can never know the rich reward that comes through making all these things, glorified for the sake of loved ones.

Perhaps the simplest and healthiest bread made is the old-fashioned, salt-rising loaf. At least physicians often instruct their nurses to prepare or procure that kind of bread for their patients. As my grandmother, a famous "Carolina cook," instructed me in this special variety I shall give the plan in detail. At twilight take one-half pint of new milk, simmer it gently, thicken with three teaspoonfuls of corn meal, smooth it nicely over the bottom of a sugar bowl or some small earthen dish which can be tightly covered, wrap the bowl in a newspaper and put it in a warm place over-night. A uniform temperature of 90° is what should be observed; but if you do not possess a thermometer, mind grandmother's rule: "Keep it in a place where you will be comfortably warm yourself." When you rise in the morning the meal will be full of little cracks, as though a miniature earthquake had shaken it. Put one teaspoonful of salt, one of sugar, and a tablespoonful of corn meal in a pitcher, pour over it one pint of boiling sweet milk, or water, use the former if possible, stir it well and when it becomes luke-warm thicken with flour to a stiff batter and stir in the mixture in the sugar bowl. The best place to keep the pitcher is in a kettle of hot water on the hearth or reservoir. In an hour the contents will be foaming to the top of the pitcher. Sift a bowlful of flour and mix with tepid milk previously boiled, adding a tablespoonful of salt and the contents of the pitcher. Knead for one hour, then cover with a fresh bread cloth and let rise again until the dough begins to crack open on the top. Then mold into small loaves, place in buttered tins and when they have risen to twice their original size butter the top, place in a moderately warm oven, increase the heat to 350° and bake from 30 to 45 minutes according to the size of the loaves. Small ones are sweeter but will not remain moist so long as larger ones. If water is used, the bread will be just as light, but not so white and nutritious as if milk is used all the way through. A good salt-rising loaf is the "queen" of all on the staff of life, but another excellent variety is

YEAST BREAD.

IT is more convenient for city housekeepers to purchase yeast cakes. But as rural housekeepers have hops, meal and potatoes always in store, I shall begin at the beginning the cup of yeast.

YEAST.

PARE six medium-sized potatoes, place in a vessel containing one-half gallon of cold water and a handful of hops tied in a clean white rag, boil until tender, then pour the water off into an earthen jar, add two tablespoonfuls of sugar, one of salt and one of ginger to the potatoes, and mash thoroughly. Stir all briskly into the potato water, and when luke-warm add two yeast cakes or one teacupful of home-made yeast, which has been previously dissolved in a little warm—not hot—water. Beat with a wooden spoon or paddle for 10 minutes and set away in a warm dry place; in 24 hours it will be ready for use. It will keep its vitality for 10 days in Summer and three months in Winter. But during the warm season it is preferable to stir corn meal into the wet yeast until it can be molded into little cakes, which, dried in a cool place, will keep for three months, even in dog days.

BREAD.

WHEN preparing pototoes for dinner the day before baking day, pare five or six extra ones; pour the water in which they have been cooked into an earthern jar, mash the potatoes and take out a quart before seasoning the other for dinner. Take one pint of flour, stir it with cold water into a smooth paste, add this and the mashed potatoes to the water in the jar, when tepid add one cupful of jug or liquid yeast or one of the dry yeast cakes, and beat rapidly for ten minutes. If it foams up in snowy white caps any time in the afternoon, stir briskly. This prevents souring, by allowing the rapidly forming carbonic acid to escape. Any time between tea and bed time sift your pan of flour, make a deep well in the center, pour in a quart of warm water in Winter, cold in Summer, a tablespoonful of salt and your jar of yeast, mix and knead one hour. Be careful not to have too much flour, as the dough should be rather soft when first mixed, adding more flour as the kneading progresses. This recipe makes from six to eight loaves. Rise early, or the dough will be running over the bowl. Mold into loaves—don't knead any—and bake one hour in a moderate oven. Do not grease when putting into bake, but rub the top of each loaf with a buttered cloth upon taking it from the oven, and the crust will be thin and soft.

RUSKS.

TAKE out a quart of the dough, add one-half cup of sugar, one-half cup of butter, knead and mold into biscuit as long as patience will permit. Let them rise a longer and bake a shorter time than the loaves.

Some may object to the use of cold water in mixing; but I find it a sure preventive of sour bread during dog days. I have been in a great dilemma sometimes in preparing yeast and finding my hop supply exhausted, but I have experimented satisfactorily by using a handful of peach tree leaves instead, the bitter acid proving a perfect substitute.

POTATO BREAD.

THIS is the simplest method of all, and one which I would advise all young housekeepers to try first, for they are sure to meet with good results and there is nothing so inspiring as success. The yeast is made in connection with the "sponge" for baking, so you are sure always of fresh yeast and never have but one cupful in the house in the way. The trio of essentials for good bread are: good flour, good yeast, good kneading.

POTATO YEAST.

BOIL eight small potatoes in a quart of water; pour the water off into your bread jar. Add three tablespoonfuls of white sugar, two of salt, and mash well; dissolve one yeast cake and stir into the potatoes; let stand in a cold place for 12 to 24 hours. When it shows signs of fermentation, it is ready for use.

BREAD.

BOIL eight medium-sized potatoes in a gallon of water; when tender pour the water into a bread jar; mash the potatoes well, after adding sugar and salt as for yeast, and when lukewarm add the cup of yeast, stir and mash again. Take out a teacupful, cover tightly and set in a cool place for next week's baking. The remainder of the potatoes may now be stirred into the bread jars, keep in a warm place over-night, and in the morning little, bead-like bubbles will be rising to the surface of the water. Stir in enough flour to make a stiff batter, set in a warm place to rise, and when light and foamy stir in enough flour to knead well; in a half hour it will be ready to mold into loaves, when proceed as with common yeast bread. Grease the loaves with butter after taking from the oven.

EMMA C. STOUT.

WE do not like soggy dressing and therefore never moisten the bread with milk or water. Old bread is used and such parts as cannot be fined are rejected. We season liberally with butter, pepper and salt. The addition of a little sage is an improvement for many.

When Baby was sick, we gave her Castoria
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

Miscellaneous Advertising.

Clergymen

Lawyers, Actors, and Singers, are often troubled with loss of voice, resulting from a slight cold, weakness of the vocal organs, or inflammation of the throat, and in all such cases may be promptly relieved by the use of Ayer's Cherry Pectoral.

I would not be without Ayer's Cherry Pectoral on any account. It is an invaluable remedy in Bronchitis and Lung Complaints, and speedily relieves Hoarseness or Irritation of the Throat, caused by public speaking.—Rev. E. Bethune, Jamesville, Tenn.

I have been so much afflicted with Bronchitis that I should be unable to perform my clerical duties without the use of Ayer's Cherry Pectoral.—A. G. Kirk, Pastor Baptist Ch., Hillsville, Pa.

Ayer's Cherry Pectoral,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by Druggists. Price $1; six bottles, $5.

GOLD $100.

We will pay one hundred dollars gold in premiums for best results from eight weeks' trial of **Sheridan's Powder to Make Hens Lay.** Send your name and post-office for particulars. I. S. JOHNSON & CO., 22 CUSTOM HOUSE STREET, BOSTON, MASS.

MASON & HAMLIN

ORGANS.

Highest Honors at all Great World's Exhibitions for nineteen years. 100 styles, $22 to $900. For Cash, Easy Payments, or Rented. Catalogue, 46 pp., 4to, free.

PIANOS.

The Improved Method of Stringing, introduced and perfected by MASON & HAMLIN, is conceded by competent judges to constitute a radical advance in Piano-forte construction.

Do not require one-quarter as much tuning as Pianos generally. Descriptive Catalogue by mail.

ORGAN & PIANO CO

154 Tremont St., Boston. 149 Wabash Ave., Chicago. 46 E. 14t St. (Union Sq.), N. Y.

MELLIN'S FOOD

TRADE MARK.

FOR INFANTS AND INVALIDS.

The only perfect substitute for Mother's Milk. The most nourishing diet for invalids and nursing mothers. Keeps in all climates. Commended by physicians. Sold everywhere. Send for our book "The Care and Feeding of Infants." Sent free.

DOLIBER, GOODALE & CO., BOSTON, MASS.

GOLD MEDAL, PARIS, 1878.

BAKER'S Breakfast Cocoa.

Warranted *absolutely pure Cocoa*, from which the excess of Oil has been removed. It has *three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup.* It is delicious, nourishing, strengthening, easily digested, and admirably adapted for invalids as well as for persons in health.

Sold by Grocers everywhere.

W. BAKER & CO., Dorchester, Mass.

KEEP WARM

With one of **Halsted's Foot Warmers.** Heated with CHEMICAL FUEL. Burns 10 to 15 hours. No flame or smoke. Cheap, safe and handy. See circular.

News of the Week.

HOME NEWS.

SATURDAY, Dec. 4, 1886.

NEW JERSEY assessors report the railroad property in the State amounts to $192,980,343. The State tax of $964,901 upon it defrays all the State expenses.....Several weeks ago, when Eastport, Me., was nearly destroyed by fire, the Associated Press dispatches to all parts of the country day after day denounced the fishermen of the neighboring Canadian Islands for plundering the burning town and committing outrageous violence in doing so. A New Brunswick paper now denies the truth of these reports, on the ground that a Custom House official has not been able to find any of the stolen property. It states the Canadian fishermen did all in their power to help the people to save and protect their goods. "Lord! how this world is given to lying!"..... ..

It appears that Judge Manning, Minister to Mexico, has had a clear case of jim-jams, owing to a week's gross drunkenness in Mexico City. For years he is said to have been subject to such outbreaks twice a year, quietly in his own house.....Sugar grinding began in Cuba Thursday .....Charleston had several lively earthqnake shocks, Thursday, one of which crashed walls and loosened plastering. There were 17, in all, last month there and in other parts of South Carolina.. .... During November the Postmaster-General established 239 fourth-class post-offices and discontinued 218.....A bill, by General Hazen, is being considered by the Secretary of War, providing for the reorganization and incorporation of the Signal Service as a regular Bureau of the War Department..... .... A terrific storm visited the east coast of New England early Wednesday morning followed by a tidal wave of some energy. Lightning killed Mrs Willard at Elizabeth, Me ....To meet expenses the general executive board of the Knights of Labor are levying an assessment of 25 cents per member upon the local assemblies of the order. The fund is to be used to help Knights "locked out" by what is claimed to be a "combination of capitalists" against the order. Many complaints that members are blacklisted by railroads and other large associations.....In Montreal, the Superior of the Oblate Fathers has announced that no Knights of Labor will be allowed to take the sacrament. There is a strong opposition to the order among the Catholic dignitaries of Canada.....The tanners' strike at Salem and Peabody, Mass., begun July 12, collapsed Saturday. Over 5,000 men "went out" at command of a "walking delegate," or were "locked out" because they refused the leather of a boycotted firm. The places of most of them have been filled, and few can get work again..... .. On December 1, the N. Y. State canals closed by official order. The season of 1886 opened May 1. The total number of days during which the canal was open was 215, or somewhat over the average. The tonnage of 1885 was 4,732,000 tons, and that of 1886 will be about 5,250,600 tons. As soon as the water is drawn from the canals the Superintendent of Public Works will supervise the lengthening of locks 47, 48, 49, 51 and 52 on the Erie Canal, and of locks 3, 4 and 5 on the Oswego Canal. The object is to allow two boats to be locked in tandem fashion. The whole work must be completed before the opening of navigation in 1887. The season just closed having been a most successful one, the future of the canals will be looked forward to with great confidence. ...Returns of traffic on the Welland Canal for the season of navigation just closed show an increase of 34 per cent. as compared with last year's. At Kingston, 6,500,000 bushels of American grain were transhipped for Montreal, being the largest quantity since 1880. During the coming Winter some very important improvements will be made on the Welland Canal, to be completed in time for the opening of navigation. The canal will be deepened to 14 feet draught, or two feet over what it is at present .....Erastus Brooks left his wife and family property estimated to be worth $200,000 .It is officially stated that Chicago's growth is 50,000 yearly. It is proposed to increase the revenue of the city $1,500,000 a year by licensing wholesale and retail traders.....A cigarette at Raleigh, N. C., started a fire which involved 1,200 bales of cotton and caused $36,000 damage Tuesday. ....It is estimated at the Internal Revenue Bureau that the revenue from the tax on oleomargarine, which went into effect on Nov. 1, will amount to about $400,000 for the last month..... Another decision has been handed down in the long-drawn-out litigation over the validity of the patent of Nelson W. Green for the tube or driven well. Judge Colt, of the United States Circuit Court at Boston, has sustained the patent in a suit brought against the Fitchburg Railroad for infringement..... Most disastrous fire in its history in Duluth, Minn., Saturday night—loss $865,000; insurance $702,350. Three men killed. Total amount of grain lost, 880,000 bushels, valued at $585,000. The loss has helped to raise the price of wheat throughout the country, but especially at Chicago.... Very disastrous incendiary fire at Forsythe, Mo!, Monday night. Loss $300,000.. .... The Union Pacific has completed arrangements to establish a weather service over its entire system similar to that in use by the Federal Government. This is the first attempt at railway meteorological survey, and will probably be generally adopted. The Chicago and Northwestern and the Central Pacific have been invited to coöperate with the Union Pacific, so as to make a through railway weather service between San Francisco and Chicago. The Canadian Pacific will also probably coöperate.....S. H. H. Clark has been elected first vice-president of the Missouri Pacific R. R., to succeed Hoxie. He was formerly manager of the Union Pacific R. R.....Tremendous mining excitement in San Francisco, Thursday. Fortunes made and lost in a few hours. Some mining stocks went high—high. Then all collapsed on report of numerous heavy failures—finally they quieted down A marvelous flurry..... .....Dr. Hamilton Williams, of Greenpoint, L. I., who was mixed up in the Phœnix Park assassination of Burke and Cavendish, succeeds blatherskite Rossa as leader of the Irish Fenians, "force," or dynamite faction.... Public Printer Benedict at Washington, with a force reduced by 500, is turning out more work than was done formerly.....Secretary Bayard's new appropriation bill for consular and diplomatic service puts up salaries handsomely in several cases, besides substituting salaries for fees to the amount of $175,000. The total increase is from $700,000 to $1,048,000.... . Congress will resume business Monday, with 12,000 bills on its files and hundreds favorably reported on the calendars.. .... Maxwell, the condemned St. Louis "trunk" murderer, is again respited till February 1. .....Francis Palms, of Detroit, worth from $15,000,000 to $18,000,000, died last week. It was about his daughter that Jones of Florida made such a fool of himself ...The public debt was decreased $3,005,250 last month, against a decrease of $13,201,620 during October. The debt less $224,071,554 available cash items (including $100,000,000 reserve) and $40,093,536 net cash in the treasury, is now $1,351,342,698. ....The month of November in the Northwest was two and a half degrees colder than the average for that month in 20 years. In some places in Dakota, Wednesday, the thermometer was 22° below zero ....A delegation of business men from Chicago and the Northwest are in Washington to urge upon the President the favorable mention of the Hennepin Canal project in his message to Congress..... ....Some of the papers of Cincinnati have been fined for advertising lotteries.....Labor organizations in many places are asking for amnesty for the condemned Anarchists..... A Buffalo young fool and "fooless" passed through the Niagara Falls whirlpool the other day in a double barrel. If the papers didn't name such foolhardy people, there would be none.....The report of the Life-Saving Service says the number of casualties last year was greater by 28 than that of any former year. .....Hayes is the only living ex-President, and Hamlin and Wheeler are the only living ex-Vice Presidents of the United States. Blaine is the only living defeated candidate of a leading party for the Presidency. That office seems to carry fatality with it.....Zero weather, blizzards, disasters and death is the Western meteorological situation at present.....In a suit against Gen. Ben Butler, for money which it was charged he owed the Soldiers' Home at Washington, the jury rendered a verdict of $16,537.50 for the plaintiffs yesterday.. .....Thirteen grain-laden canal boats for New York are frozen up in five inches of ice near Little Falls. A State tug is trying to release them... .....The Dominion Government will fit up the forfeited schooner Morning Light as a cruiser. This is the first vessel confiscated under the treaty of 1818....A Centennial Constitutional Commission has been organized from the various States to arrange for the centennial celebration of the promulgation of the Federal Constitution.....A Chicago dispatch states that 240 car-loads of live stock are in danger of freezing on the Streater branch of the Chicago, Burlington, and Quincy Railroad, the trains being delayed by a broken bridge.....

FOREIGN NEWS.

SATURDAY, Dec. 4, 1886.

THE Irish question is again assuming an acute phase. The Tory Government, it seems, has determined to renew the policy of coercion, which the advocates of Home Rule last Winter declared was the only alternative to the adoption of their principle. The adoption of this long-tried policy was signalized by the transfer of the Under Secretary for Ireland to Tasmania, because, as is said, of his conversion to the Home-Rule doctrine. He is to be succeeded by General Buller, the English army officer who was sent over some time ago to restore order in a disaffected district. The latter appointment is only provisional, however, as Buller has disappointed the Tories by using his large powers with moderation. The leaders of the National League are to be proceeded against, but they openly defy the Government and are sustained by popular sympathy in Ireland. An anti-rent agitation has been set on foot, and the outlook for the Winter is a stormy one. The troops in Ireland are being reinforced in anticipation of trouble. Meanwhile the Home Rule doctrine is spreading in Scotland and Wales. The Scotch home-rulers are demanding legislatures for the representative nationalities of the United Kingdom. In this demand they are supported by the people of Wales, where a tithe war is in progress and where a strong demand for church disestablishment is made. Taken altogether, England's condition at present is anything but reassuring to her statesmen, who have to contemplate the possibility of foreign complications of a serious nature..... ....Just at present there is a lull in matters in the Balkans. Russia, it is announced, will not insist upon the selection of the Mingrelian prince whom the Bulgarians declared that they would not accept as a candidate for the throne. The Bulgarians on their part have resolved to send a deputation of notables to the principal European capitals to explain to the Powers the actual condition of affairs in Bulgaria, and to ask the Powers to make a choice of a candidate for the throne, with due regard to the country's needs and disposition; in short, to regard the question as European and not a Russo-Bulgarian question. In spite of Russia's temporary halt, however, there is an uneasy feeling in Europe, where it is felt that she is only waiting her opportunity. In Germany the government is earnestly pressing the passage of a bill increasing the army so that it will be a match for the French army at any time, though continuing to declare its belief that peace will be maintained. In Austria extra military estimates have been voted. France, meanwhile, keeps the Egyptian question to the front. The view finds constant expression in the most influential French journals that Lord Salisbury's declaration about the limit of England's stay in Egypt not being a time limit points to an indefinite occupation of the country, and that French rights and interests would be prejudiced by such an occupation. The French ambassador, it appears, has asked for a more definite statement of England's intention in regard to the occupation than has yet been given.

Something An Inventor Found Out.

AMONG literary people Phineas Garret's volumes of "One Hundred Selections" are standard works. Among business men all over this country he is known as the inventor of the Penn Letter Book for copying letters without the aid of water or press. Mr. Garrett was found at his office, No. 708 Chestnut St., Philadelphia, and asked regarding his experience with Compound Oxygen.

"I will tell you what I know about it," he replied. "When living in West Chester I suffered terribly from nasal catarrh, which was seriously aggravated by sudden changes of the weather. The usual remedies gave me no relief and the disease had advanced so far that the cartilage of the nose was as hard as bone. My whole system suffered. Life lost its attractions. I visited DRS. STARKEY & PALEN, now at 1529 Arch street, in this city, placed myself in their hands, and began the 'Home Treatment.' I found it very beneficial and continued it until I was entirely cured."

"Did its use entirely restore you?"

"Yes. I have been quite well for some time. My wife uses Compound Oxygen with excellent results when occasion requires, and I have seen its effects on others."

"Have you had an opportunity to observe its effects on persons outside your own family?"

"Yes," answered Mr. Garrett; "I recall the case of a young man who worked for us. He had consumption and hemorrhage after hemorrhage. He took the Compound Oxygen for a year and improved wonderfully. Many of my friends have benefited by its use. Everybody ought to know the value of this remedy. My long and satisfactory experience with it causes me to grow enthusiastic when the subject is mentioned."

"Do you always use the home treatment?"

"No. I prefer to go to the office, 1529 Arch street, and take the Compound Oxygen there."

"Why so?"

"Well, there is a satisfactory moral effect about taking medicine under the direct supervision of an experienced physician in whom you have confidence. Still, I use my Home Treatment very often and with great benefit. It is a pleasant recreation, if I have a cold in my head or an attack of indigestion, to go and be cured at once, instead of waiting until I reach home at night."

"Did you ever observe any injurious effects?"

"On the contrary. The heart is strengthened and the pulse is steadier after using it. In every respect my experience and observations lead me to regard Compound Oxygen as a valuable remedial agent and one that only needs to be better known to find universal acceptance." A pamphlet on the subject is mailed free to all who want it.—*Adv.*

A Good Reputation.

"*Brown's Bronchial Troches*" have been before the public many years and are everywhere acknowledged to be the best remedy for all throat troubles.

Mrs. S. H. Elliott, Ridgefield, Conn., says: "*I have never been without them for the last thirty years. Would as soon think of living without breath.*"

They quickly relieve Coughs, Sore Throat, and Bronchial Affections. Price 25 cents. For sale everywhere and only in boxes.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, December 4, 1886.

THE Minneapolis Millers' Union, organized three months ago for the purpose of controlling Northwestern wheat, collapsed Dec. 1.... ..The St. Paul Pioneer-Press insists that farmers' deliveries of wheat in Minnesota and Dakota have been only temporarily checked by the storm, but will be resumed in as great a volume as ever as soon as the roads are opened..... ..A project of law pending in the Danish Folke-thing places the oleomargarine trade under stringent regulations. It cannot be sold in the kind of vessels or at the places where dairy butter is sold, and it is forbidden, under penalty, to give it the same color. .....State Entomologist Forbes, of Illinois, says the outlook is very gloomy for the 1887 wheat crop unless some unusual state of the weather destroys the hatching brood of chinch bugs.....Another lot of diseased cattle were slaughtered in the Phœnix distillery yards, Chicago, Wednesday .. The Tenth Annual Convention of the N. Y. Dairymen's Association will take place Dec. 14, 15, 16, at the Court House at Norwich, Chenango County. The usual concession in railroad fares will be made by the Delaware, Lackawanna and Western roads, which center at that point. Special rates have also been secured at the hotels. Dairymen throughout the State are invited to be present and to participate in the discussion. Col. F. D. Curtis will talk about "The Possibilities of the Dairy;" Prof. I. P. Roberts, "Water and Food for the Dairy;" Dr. E. Lewis Sturtevant, "The Work of the Experiment Station;" J. V. H. Scovil, "Feeding for the Production of Milk." Other prominent agriculturists will also address the meeting.....In parts of Nebraska corn is selling at 14 cents per bushel, oats 15 cents and wheat at 41.....Farmer Allen, of East Syracuse, N. Y., mourns the loss of some $40,000 worth of choice Holstein-Friesian bulls and cows burned to death in his model barns, Tuesday, which some malicious miscreant set on fire. .....Shippers of live cattle and dressed beef to the United Kingdom are loudly complaining that there's no money in the business, or that they are actually losing thereby; how, then, account for the fact that last week they shipped 659 live cattle, 95 live sheep and 5,000 quarters of dressed beef from this port and 465 live cattle together with 2,320 quarters of beef from Boston, besides more shipments from other points?.....Englishmen allege that our American cattle exports come into competition rather with their second and third grades of stock than with their first.....French producers allege that their cattle are perfectly free from contagion of all kinds, and are seeking to have the English embargo against them removed.....The scheme to found a co-operative packing-house in Chicago is discouraged by the Chicago Society of Socialists, which asserts that "this co-operative scheme is impracticable and is doomed to certain failure." There's not enough of money to start the thing.....In the 10 months ending October 31 England imported 9,820 horses, against 12,230 in the same months of of 1885. In the first ten months of this year the exports of the United Kingdom were 6,368 head, against 5,587 in the corresponding time last year ....The whole cost of harvesting the immense cranberry crop on the Cape is estimated at $300,000 ....Cattle in Montana perished by thousands in the recent blizzard. Sheep es-

pecially suffered.....The Planters' Club of Havana and other clubs of the island have sent cablegrams to the Minister for the Colonies asking that the export taxes on sugar, molasses, brandy and tobacco from Cuba be abolished.....Philadelphia butter dealers have formed an organization to help enforce the oleo law.... The Pennsylvania Wool Growers' Association will meet at Washington, December 28 and 29.....In a late Australian wool show the best fleece weighed 16 pounds five ounces in the grease, nine pounds four ounces scoured, and was valued at $2 82. .....The exports of frozen meat from New Zealand are stated in the London Economist to be about 700,000 carcasses of mutton annually... ....The imports of Red Polled cattle this year will exceed 100 head .....The claim is made that Colorado has more fine Galloway cattle than any other State in the Union . It is estimated that the butchers' strike in Chicago cost the country and the butchers over two million dollars..... ....Between 1875 and 1884 a total of 55,000,000 rabbit skins were exported from Tasmania, New Zealand, the supply of 1884 being 9,800,000 skins.....The onion crop, owing to a smaller acreage, the dry weather and the maggot, will show a reduced yield from that of last year.....The combined exports of cheese from New York and Montreal up to a late date show a decrease of 269,000 boxes compared with 1885.....The production of oleomargarine for domestic consumption is estimated by Commissioner Miller at the rate of 100,000,000 pounds per year ... As one of the results of the strike at the Union Stock Yards, Chicago, it is stated that the lowest prices for cattle touched in seven years were reached on the 17th ult., when steers averaging 1,000 pounds sold as low as $2.90 per 100 pounds, and several car loads equally good for $3. During that week 500 head (15 car loads) of Texas yearlings were sold to a city butcher at $7 per head, which was the price offered for them in Texas. The freight amounted to about $1,500..... ....

Crops & Markets.

SATURDAY, December 4, 1886.

The Mark Lane Express, in its review of the British grain trade during the past week, says: The sparse offers of native wheat are attracting the attention of the trade, and it is believed that the crop has been largely overestimated. It is now calculated at only 6,500,000 quarters—52,000,000 bushels. In the provincial markets the supplies are rather greater. Values have not risen. The sales of English wheat during the week were 49,963 quarters, at 31s. 11d. against 68,218 quarters at 30s. 9d. during the corresponding period last year.

OWING to the unremunerative prices of mid-Kent hops in England, and the depression in the hop industry generally, a large grower is grubbing up 100 acres of hops there; and reports from other parts of Kent and other hop-bearing English counties go to indicate that about 10,000 acres of hops will be grubbed up in England this year. Here holders of hops are still pretty firm: but buyers want concessions. Only the very choicest hops bring 30 cents; 25 to 28 is a full range for good to prime.

The statistics showing area, aggregate yield and yield per acre of cereal crops in the Province of Ontario, Canada, for 1886 and 1885, together with averages of area and yield for the five years' period 1882-86, are represented in the following:

Crops.	Years.	Acres.	Bushels.	Bush. per acre.
Fall wheat.....	1886	886,402	18,071,112	20.4
	1885	875,136	21,148,281	24.5
	1882-86	982,462	20,635,813	21.0
Spring wheat.....	1886	577,465	9,518,553	16.5
	1885	799,163	9,129,854	11.4
	1882-86	651,380	10,550,631	16.1
Barley.....	1886	735,778	19,512,978	26.5
	1885	597,823	16,532,547	27.7
	1882-86	727,079	19,572,730	26.9
Oats.....	1886	1,621,901	58,605,608	36.2
	1885	1,543,715	55,229,712	35.8
	1882-86	1,490,651	55,333,393	37.1
Rye.....	1886	67,779	1,106,162	16.3
	1885	78,293	1,271,505	16.2
	1882-86	124,575	2,102,453	16.8

Wheat, barley, oats, rye and peas were reaped and housed in fair condition, and the final report of yield differs but slightly from the August estimate. The wheat crop is about 3,600,000 bushels less than the average of five years; barley is only 50,000 bushels less, and oats is 3,300,000 more. Rye is diminishing in breadth and yield.

The week up to Thursday was an active one in pork packing operations in the West. The 10 prominent packing points handled 505,000 hogs during the week, against 405,000 last year, and since November 1 a total of 1,485,000, against 1,775,000 last year, indicating a shortage of 290,000; other smaller packing places in the West have packed 146,000, against 158,000 last year. It is probable that the shortage for all points is about 300,000 hogs. The quality of hogs now marketed is generally excellent; in some cases reported not quite so heavy, but not so rough. At Cincinnati the average weight for November is one pound heavier than last year, and two pounds heavier than two years ago, but six pounds lighter than three years ago, for the same month. The packing record of Chicago is not far from 500,000 hogs less for the current month than it would have been were it not for the recent senseless strike.

VERY LATEST.—During this week, wheat options at Chicago and New York have advanced 4 to 4¼ cents, and for cash four cents per bushel on increasing exports and speculation and small stocks abroad. The renewed strength is quite pronounced, and the opinion gains ground that a permanent gain in wheat prices has finally begun. Indian corn went 1½ cent higher with small stocks and heavier demand, and wheat flour with a better inquiry for export and reduced production has been marked up 15 cents per barrel. Wool is affected unfavorably by the London sales, which are off 5 to 10 per cent. from previous auction prices. The Louisiana sugar crop "is now estimated" at 150,000 hogsheads, a reduction from previous estimates. There is more activity in hog products. Speculative markets are in sympathy with the upward turn to grain prices and there is an increasing outside demand. Pork has advanced $2 per barrel and western steam lard ¼ cent per pound, in the week. On the whole, the week is marked by a distinct increase of speculative activity at all centers.

MARKETS BY TELEGRAPH.

SATURDAY, December 4, 1886

CHICAGO.—Compared with cash prices a week ago, No. 2 Spring Wheat is 4c. higher. No. 2 Red, 3¼c. higher. Corn, 1¼c. higher. Oats, 1c. higher. Flaxseed, 2c. lower. Pork, $1 40. Cattle, from steady to 20c. lower. Hogs, unsteady; lower on light grades; higher on heavy. Sheep, higher on Western and lambs; steady on others.

CHICAGO.—WHEAT.—No. 2 Spring, at 77¼@78c; No. 3 Spring, 71c; No. 2 Red, 78¼c. CORN.—No. 2, 38c. OATS.—No. 2, 27¼c. RYE—No. 2, 54c. BARLEY. No. 2, 58c. FLAXSEED—No. 1, 90½@91 Timothy Seed—Prime, $1 74 @1 75. MESS PORK—$10 87½@11. LARD.—$6 20. Every Mill warranted to do just what we claim for it. Write for our new illustrated catalogue and mention this paper. The Edw. Harrison Mill Co. New Haven, Ct., or Columbus, O.

For the Young.

SAW some boys playing on the street the other day. It was at noon time. Most of the boys worked in offices or shops. They were glad of the chance to run about and jump after eating their dinners. They had an old tin can. It was battered and knocked all out of shape, for several teams had run over it. The boys counted out and the one who had to be "it" stood near the can, while others kicked at it. The point was for the boy to touch the one who kicked it last. The one caught in this way had to be "it" and take his place by the can. The can had a hard time for it was kicked all up and down the street. The boys seemed to have lots of fun out of it and everything was good natured. When the whistles blew for one o'clock how the boys scampered away to work. An old fellow with a great bag on his shoulder came along at last and picked up the can.

I BELIEVE in playing strong and hearty games. I like a good game of base ball as well as the next one. I used to say I would rather play a game of ball than eat my dinner, but I guess I am past *that* now. I like to see girls play ball. They can do it without losing a bit of dignity. Everybody needs to spend a part of the time out in the air and sunshine and growing boys and girls who won't exercise, will be sure to make little old men and women before their time. The trouble about playing ball and other games like it is that men and boys want to go off by themselves and have all the fun. Then again some boys get so excited about it that they forget everything else and neglect their work. That is wrong. There is a time for work and a time for play and they must not run together. What I like is to see the whole family from grandfather down to the baby play a game of ball. That makes good fun for all concerned, everybody feels better for it and there is no harm done.

IT hardly seems possible that Christmas is so near, does it? Yet if we can believe the almanac it is close at hand. I suppose old Santa Claus is hard at work packing up his goods and getting his reindeer into shape for the trip. I hope he will find you all this year: as he is a pretty good old fellow, I guess he will. I always feel a little sorry when I hear of a boy or girl who has lost faith in Santa Claus. I always believed in him and I always mean to. Santa Claus does more for us than we think. Even when he is so busy that he can't come himself, the talk about him always moves those who are about us to say and do the things we like to have said and done. It is good to talk about him and think about him just as long as we can. We want to be children, in one sense, just as long as we live. We mustn't carry any ill feeling against anyone over Christmas. If we don't feel just right towards any person, now is the time to get ready to forgive and feel right. Remember this now, and bury all the spite and bitterness and all the rest of it so far out of sight that it never will come to light again.

EVERY night when I go home I can see the great torch of Liberty out in the harbor. It makes a fine showing—high up in the air. For a long time Liberty was in darkness, as no arrangements had been made for keeping up the light, but now it is brilliant enough. This idea of Liberty is a grand one. I hope you can all see it some day.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK: I have read the letters of the Cousins, and enjoyed them very much, and would like to be a Cousin too. I wrote you a letter once before and it found its way into the waste basket and I thought I would try again and see if you would not let me in this time. Our school is closed this week, there is so much sore throat. We planted the seeds, but it was too dry for them to do well. The Alaska Peas did better than any of them. I have some corn that is called the Japanese, and will send you some if you would like me too. It grows on top like broom corn. Yours respectfully,

Shelbyville, Ills. LILLIE VAN DYKE.

[You may send the corn. I hope the sore throat did not get after you.—U. M.]

DEAR UNCLE MARK: It is too damp for us to go out to-day, so I will spend part of the time in writing a letter to you, that I ought to have written some time ago. But I was sick a long time this Fall. All of us were sick at the same time with diphtheria. Thank you for the sweet peas you sent us last Spring. The weather was so cold and wet we did not plant them as early as we ought, and they did not grow as well as they would if planted earlier; but such as bloomed were beautiful and were very sweet. I sent a few of my seed to my little cousin in Alabama. We have a few pansies blooming now. Our Guineas laid a great many eggs last Summer. I raised a pretty flock of young ones. That dog you told us about must have been very cross to kill your kitten. Our dog is so fond of the cats he does not like to see us play with them. We all like the "Story of a District School" very much, but I like what you have to say to the Cousins more than anything in the RURAL. Papa has lately bought for Mamma an Avery Sewing Machine, No. 6. She is delighted with it. It sews so fast and makes so little noise. It is a great deal simpler than her old one. I can bake a nice loaf of bread. I have never made up the dough, but Mamma says I may when I get stronger. I made some nice cabbage pickle by myself. My brother Rives has learned to make brooms very nicely. We pulled the fodder from the corn for him. He and George have raised some fine celery this year. Your affectionate niece,

Farmville, Va. BETTIE DANIEL.

[I am glad you are all better again. I never like to be sick. Guineas are good layers, but don't they make a noise, though? I think our dog is sorry now that he killed the kitten. He is a cross fellow, though, and cares mostly for himself. I am very glad that you can make good bread. That is the best accomplishment a woman can ever learn. I guess your house will be kept pretty clean with all the new brooms you are making.—U. M.]

DEAR UNCLE MARK: You either did not get my last letter or it went to make your fire: but I will try again. The Garden Treasures almost all grew; they were lovely. The Alaska peas were ripe here in 80 days from planting. Angel of Midnight Corn did not ripen; it was killed in August. We had a nice garden this Summer. I have a Jersey calf named Bessie but Papa says it will die. Mamma has 23 hens. Papa and my brother Wallace claim the cow and cat. October was as fine here as August is any year.

From your Niece,

Marquette, Mich. SADIE M'COMBIE.

[I am glad you have the live stock so well divided. I think Wallace has the worst share. I do hope the calf will not die.—U. M.]

DEAR UNCLE MARK: I wrote one letter, but it went into the waste basket. My Papa has taken the RURAL nearly nine years, and I enjoy reading the letters the best. I live on a farm one mile and a half from Middletown. We have four horses, one colt, five cows, two calves, and 10 pigs, and lots of chickens. We had a hen with 15 chickens, and she did not loose any. We intend to raise more chickens next year. I did not receive any sweet peas. We planted some of the Garden Treasures sent out by the RURAL. There were quite a number of different kinds that came up; some of them were very pretty. We had a nice vegetable garden this year. My brother planted the peas; they bore well, and we saved some of them for seed. We planted a few of the melon seeds, but they did not do very well; the melons were very small. I live where I can see St. Helena and Cobb mountains. St. Helena Mountain is 4,545 feet high, and Cobb Mountain is higher. I live 15 miles from the big Geysers. I have been there two times. I have a black cat that I call Gypsy. She got her foot in one of our steel traps, and hurt it; but she is getting better.

Lake Co., Cal. LUELLA J. COBURN.

[Good for that hen. She deserves a medal and a long life. Better let her try again next year. That cat will be very careful where she steps hereafter.—U. M.]

DEAR UNCLE MARK: I am 11 years old and would like to join the Y. H. C. Papa has taken the RURAL for two years. I like to read the letters of the Cousins. I live in Mercer Co., N. J. I live on a large farm and my Papa has a fertilizing mill. I have a pet colt. It follows me all around. I raised all of the poultry this year and Papa gave me a share in them. Papa cut very nearly 200 tons of hay and I raked it all with Papa's new steel-tooth sulky rake. I have a pair of twin brothers 10 months old, and another brother and sister. CARRIE M. DILATUSH.

Robbinsville, N. J.

[You are a great farmer. You do more than some men can do. We are glad to have you join. We would like to see those little boys.—U. M.]

DEAR UNCLE MARK: I am not going to school this afternoon, so I will write to you. What are the best kinds of hens you know of? We have had almost every kind, and we like the Plymouth Rocks best. We have the Pekin ducks; they are all white, and are much larger than the other kinds. We are wintering 34 head of cattle, 21 sheep, five horses, and three pigs. We have a very good two-year-old stallion; its name is "Bob Lambert." I live close to a river, and have plenty of fishing and swimming in Summer and skating in Winter. Are there any of the Cousins who would like to correspond with me? JAMES STEVENS.

Kirkdale, Quebec.

[I like the Wyandottes pretty well, though, of course, it depends greatly upon what you want hens for. If I wanted to supply an egg market, and had plenty of range, I think I should try White Leghorns. For a small flock, such as most farmers want, my choice would be Wyandottes or Plymouth Rocks. The Langshans are going to be popular though, and they are fine birds, too. Perhaps some of the Cousins will want to write to you.—U. M.]

Literary.

BOOKS RECEIVED.

CALENDARS.—There are plenty of these useful reminders from which the public may select this year. One may read the best thoughts of his favorite author from day to day, for nearly all the more popular authors have been brought into the service. Roberts Bros., Boston, Mass., present the Daily Morning and Evening Companion Calendars. These are very neat in appearance. The selections have been made by two critical ladies, and are the fruits of a very extensive reading. Opening the Evening Calendar at random, we find the following. "Labor disgraces no man; unfortunately you sometimes find men disgrace labor—U. S. Grant." The Whitney Calendar is published by Houghton, Mifflin & Co., Boston. This contains a vast amount of practical information as well as quotations from the writings of Mrs. A. D. T. Whitney. The following hint given for November 19 will do for every day in the year. "Separate accounts, as well as short ones, make best friends." Cassell & Co. (Limited) of this city send out the Beecher Calendar. This is very attractive. It bears a fair portrait of Mr. Beecher with pictures of his home, of Plymouth Church and other buildings. Each page contains an extract from Mr. Beecher's sermons or other writings. "Active little is better than lazy much," is Mr. Beecher's counsel for January 9. These calendars all contain many good and comforting thoughts. If each family wherein they hang could spend a few moments each night in discussing the thought for the day, much good could be done.

NATURAL HISTORY FOR LITTLE FOLKS is the title of a series of handy little volumes which Lee and Shepard have prepared. The books are prepared by Mrs. Sanborn Tenney and appear to be carefully written, in language that any child can comprehend. Each volume contains from 80 to 100 illustrations. One book is given up to birds, others to quadrupeds, insects, shells, etc. Such little books are far better as presents for children than many of the so-called stories with which Christmas trees and stockings will be lined. They might be used very successfully as text books in place of the Readers which are so frequently changed in our schools.

SOMETHING new in the line of holiday books are the cheap and handy volumes published by Lee & Shepard. "Home, Sweet Home." "Curfew Must Not Ring To-night." "Nearer My God to Thee," "Abide With Me." "My Faith Looks Up to Thee" and "Rock of Ages" are all beautifully illustrated and printed. They are bound in leatherette with gilt edges. The volumes are small enough to go into the pocket. They ought to be popular this season. All lovers of the above poems will be delighted with the accompanying illustrations.

THE MADONNA OF THE TUBS, by Elizabeth Stuart Phelps (Houghton Mifflin & Co.), is a beautiful Christmas story. It was originally published in Harper's, but has been rewrittten and enlarged, and many illustrations have been added. We like it better than any of the other stories by Miss Phelps. It is a tender, beautiful love story—the right kind of a story—one that leaves a feeling of hope and gladness in the heart. We wish every one of our friends could read it this Christmas.

LITTLE MISS WHEEZY, by Penn Shirley (Lee & Shepard), is a very cunning little story of a bright little girl. "Wheezy" is but a pet name for Louise. Every one likes to read about these cunning little children, who say such odd things and are yet children—not little old people. Old people are made young again by reading good stories of children, and children are never tired of reading about other children.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

Rheumatism

We doubt if there is, or can be, a specific remedy for rheumatism; but thousands who have suffered its pains have been greatly benefited by Hood's Sarsaparilla. If you have failed to find relief, try this great remedy. It corrects the acidity of the blood which is the cause of the disease, and builds up the whole system.

"I was afflicted with rheumatism twenty years. Previous to 1883 I found no relief, but grew worse, until I was almost helpless. Hood's Sarsaparilla did me more good than all the other medicine I ever had." H. T. BALCOM, Shirley Village, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

PERSONALS.

ONE of Secretary Whitney's private hobbies is said to be fancy chicken raising.

BOB INGERSOLL says that "no man has a right to own more land than he can use."

JUSTICE MILLER, of the United States Supreme Bench, can put on boxing gloves with anybody short of Dominick McCaffrey.

MAYOR HARRISON, of Chicago, is credited with saying: "When I am running for office I would accept the devil's vote and thank him for it."

POSTMASTER-GENERAL VILAS takes his noon-day lunch at a dairy restaurant, where he gets a mug of milk and piece of apple pie for 15 cents.

FROM Paris the humorous announcement comes that Sarah Bernhardt will first get out of debt and then get into it again by attempting to become a lady farmer in rural France.

"A PATERNAL government is an infernal government," says Henry Ward Beecher. This is another form of Thomas Jefferson's maxim that that government is the best that governs the least.

MISS CLEVELAND has sent word to the President that she will accept his invitation to spend the holidays at the White House. Since leaving the capital Miss Cleveland has been far from strong.

PRESIDENT CLEVELAND has written a letter to Secretary Manning authorizing the latter to have the Bartholdi Statue placed under the care of the Lighthouse Board as a beacon, and that it be so maintained, lighted and tended.

A NEW operatic star, Fraulein Anna Kirbel, is creating a great sensation in Norway. Ole Bull's son, Alexander, among other experts, is said to have predicted that Fraulein Kirbel will throw Jenny Lind into the shade. She is 23 years of age.

GEN. SHERMAN is growing fonder of the drama and the opera every day. One of his chief reasons in coming to New York to spend the Winter was the desire to have this sort of entertainment at its best. On just this one point he admits that his beloved St. Louis is not quite up to the age.

JAY GOULD will go yachting again this Winter to Bermuda and the Southern islands that he visited last Winter. He will take his photographic apparatus along, as he did on that other trip, and a hundred or two new views will be added to the collection that shows his own handiwork.

HENRY M. STANLEY, the explorer, is in robust health and has grown stout since he was last in New York. An old brown Derby hat of a style several years gone by, a dingy, brown overcoat, check trousers, an old-fashioned linen collar and a general air of neglect, are marked features of his appearance.

DR. COLIN, of Paris, shows that the annual average number of deaths from hydrophobia in France in 26, and that since M. Pasteur began his treatment the average has not changed. An official statement shows that only 350 persons were bitten by mad dogs last year in France; while Pasteur treated 1,700 patients

GOVERNOR-ELECT "BOB" TAYLOR, of Tennessee, is now in Washington modestly receiving congratulations for his victory over his Republican brother. A man of medium hight, well bred and dressed; a lawyer remarkably well read—38 to 40 years old. He denies emphatically that he or his brother ever indulged in the buffoonery of fiddle-playing for the public during the late canvass.

FRED A. HILL, an ex-employé of Armour & Co., Chicago, and lately one of the greatest "plungers" or speculators in the grain pit, was laid out by the advance of two cents a bushel in wheat last Monday. He frequently bought or sold over 2,000,000 bushels a day, and that on less than $20,000 capital. A disorganizer of the market, few, except those who lose by him, will regret the fellow's fate.

SIEGEL, the great Italian faster, started another long fast Tuesday. His last meal consisted of oysters, steak, sole, wine and coffee, followed by a cigar. He will drink aërated waters only. His body is to be rubbed with oil as often as he likes. He will daily drink his mysterious liquor for 20 days. Then he will substitute another. The former he will not allow to be analyzed; it is claimed to be life-sustaining and an antidote against the second kind, which is deadly poison, and which he will permit to be analyzed. Entrance fee charged. Merlatti's fast still continues.

Humorous.

THE hot biscuit is the grub that makes the the butter fly.—*Lowell Courier.*

"WHAT might be considered the shortest way to spell dog?—K 9."—*New Age.*

BARTHOLDI'S Goddess may be straightforward, and all that, but she sheds her light in a torch-erous way.—*Texas Siftings.*

"SHALL I capitalize 'Boodle'?" asked the compositor. "Certainly," said the editor; "for where capital is not, there boodle can never be."—*St. Albans Messenger.*

"OCONOMOWOC," yelled the brakeman. "O'Connor may walk, may he?" exclaimed an Irishman at the other end of the car. "An' faith if yez mane me, you'll have a foine time makin' O'Connor walk whin he's paid $5 to ride."—*St. Paul Herald.*

LITTLE Freddie was talking to his grandma, who was something of a skeptic. "Grandma, do you belong to the Presbyterian Church?" "No." "To any church?" "No." "Well, grandma, don't you think it's about time to get in somewhere?"—*Boston Transcript.*

"NOW, come and tell me, dearie, what was the most interesting thing in the sermon, this morning?" "Why, mamma, it was where the minister told about somebody's taking somebody else 'apart,' but he didn't tell why it was done or how he was put together again."—*National Weekly.*

THEY were standing on the deck of a Cunarder that runs to the Hub. "And what is that shining so?" she asked. "That is the dome of the State House. I was born right in its shadow." "You don't say? And this is really America, then?" "O, dear no, this is Boston."—*New Haven News.*

"YES, Bobby," said the minister, who was dining with the family, "everything in this world has its use, although we may not know what it is. Now, there is the fly, for instance. You wouldn't think that flies were good for anything, yet—" "O, yes, I would," interrupted Bobby, "I know what flies are good for." "What, Bobby?" "Pa says they are the only thing what keeps him awake when you are preaching."—*Life.*

WHEN the Tenth Regiment, U. S. Infantry, was ordered to New Mexico from the "Lake Region," the little son of a captain did not approve of the orders of the general of the army, and indeed seriously objected to the change. He had heard much of the dreariness of the wild West, and the Sunday morning before the departure of his father's company said to his parents: "Come, now, let us go to church and say good by to God."—*Gazette and Courier.*

A NEW YORKER in Boston called a carriage and told the driver to take him to "Whiskey straight." "I don't know any such place," said the driver. "Don't know where it is? It's somewhere near Boston," was the response. "There's certainly no place of that name about here," asseverated the driver. "Well," returned the non-plussed New Yorker, "it's something like that name, anyway. It's some straight drink." "Oh!" exclaimed the driver, "perhaps it is Jamaica Plain!" and he hit it right.—*Gazette and Courier.*

VOL. XLV. No. 1925. NEW YORK, DECEMBER 18, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered, according to Act of Congress, in the year 1886, by the RURAL NEW-YORKER, in the office of the Librarian of Congress at Washington.

THE FARMER SUPPLYING THE WORLD. With the Rural's Apologies to M. Bartholdi.

The Herdsman.

PRINCIPLES OF BREEDING.—IV.

PROFESSOR G. E. MORROW.

AMONG points concerning which we may not speak with absolute positiveness are these:

Probably development of any characteristic in the parents makes its transmission more certain. Probably a stallion trained to trot fast will more certainly beget fast trotters than if his speed had been undeveloped. Excessive development, however, seems unfavorable to transmission of the quality thus greatly developed.

Probably there is a tendency to transmit the particular condition or peculiarities of the parents at the time of conception. It is safer to breed from mature animals in good health and condition than from very young or very old animals or those temporarily in bad condition.

Probably the male and female parents equally affect the offspring when a large number of cases are considered. Some animals of each sex have great power to transmit their peculiarities; others have very little. Among farm animals a male has many more offspring than any one female, and this is one reason for a common opinion that the male has greater influence than the female. I have not seen reason to accept the opinion that the parent of one sex affects, especially, the form, while the other has special influence on the disposition or the vital functions. In practice little importance is to be attached to any effect on the offspring because the female was formerly bred to a male of some peculiarity. It is possible, but not probable, that the former impregnation should affect the offspring from subsequent breeding. It is claimed there is probable danger of this result in the case of dogs. As to the other farm animals it very rarely if ever is found.

Probably no means for controlling sex with certainty has been discovered. Some animals produce offspring of only one sex, or with only exceptional production of those of the opposite sex. In my own observation the supposed rule that, with cows, the ova which descend at each alternate period of heat will produce offspring of the same sex, has appeared to be maintained. Others have not so found it. I have seen no rule for controlling sex in which I have full confidence.

Variations of a noticeable character, which are produced by accident or by any physical operation performed by man, are not usually reproduced, although they may reappear in the offspring. I have never known of a lamb being dropped with a short tail. Blindness, lameness, or any blemish caused by accident, is very rarely transmitted.

The readiness with which the breeder can secure desired qualities in his animals depends largely on the number of qualities he desires to modify and on the rapidity with which the animals reproduce. It is more than twice as difficult to fix two characteristics so they will be certainly reproduced than it is to do this with one. It is unwise to multiply the number of points to be bred for. A new breed of hogs could be made in a few years, because their rapid increase gives unusual opportunity for selection.

Horseman.

COLDS AND COUGH IN A HORSE.

F. L. KILBORNE.

A VERY common disease of horses, especially during Autumn and Winter, is the common cold—by veterinarians called catarrh, acute catarrh, coryza—due to a variety of causes and usually attended with a cough. While certain conditions of the atmosphere are much more favorable to the production of a cold than others, it is important to remember that nearly or quite all cases are due either to an unfavorable condition of the animal's system, rendering him more susceptible to the vicissitudes of the weather, or to faults in the care and management. Even the unfavorable condition of the animal system may usually be attributed to faulty hygienic conditions, so we may say the primary cause of a cold is usually to be found in the dietary and management of the horse. This being the case, most colds might be prevented by a careful prompt observance of the known laws of health. This is shown by the fact that animals that are carefully managed, so as to avoid as far as possible the causes that are most liable to produce colds and at the same time are kept in the best possible health, are usually quite free from the disease. In the majority of cases where all the conditions are carefully examined, a cause for the cold will be found that might have been prevented by exercising a little more forethought.

The most fruitful causes of colds are to be found in sudden changes of the weather, more particularly when attended by dampness, and the exposure of the animals to draughts of air, dampness, or to a suddenly lowered temperature, especially when the horse is out of condition, heated or fatigued. This last is very important to bear in mind, because a fresh, healthy horse will withstand many causes that would readily produce a cold in a system already weakened by any cause whatever. A damp stable, usually underground, or a stable where direct draughts of air can strike the animals, drawing in rain or damp snow, and allowing the horse to stand in cold, damp, or windy places when wet or heated; and exposure in the field to cold, drenching rains, or when there are heavy dews with a great difference between the temperature of day and night, are all common causes. Predisposing causes include anything that weakens the general constitution of the animal, as unsuitable feeding, hot, close stables filled with foul air and gases, and improper care and treatment.

The treatment of a cold depends upon the severity of the case. In mild attacks with slight nasal discharge and an occasional cough, but no perceptible fever, little treatment is necessary beyond rest in a comfortable stable, preferably a loose box. Steaming the nostrils night and morning by pouring boiling water on wheat bran and allowing the animal to eat it from a bucket or nose-bag while steaming hot, is excellent both for the nasal discharge and cough. When necessary to make the animal comfortably warm, apply blankets. If the limbs are cold, rub actively for 15 or 20 minutes and then apply warm, loose bandages. Daily general grooming will also be very beneficial in keeping up a healthy action of the skin.

Where there is marked fever, agents should be given that tend to lower the animal temperature. For this prepare a fever-powder consisting of two to four drams each of chlorate of potash and niter, along with 10 to 25 drops of tincture of aconite; it may be given in a pint of water twice or thrice daily. If the animal is debilitated or weakened, two ounces of mindererus spirit or two drams of muriate of ammonia or an ounce of sweet spirits of niter may be given with the above.

Should the nasal mucuous membrane continue dry and feverish and the cough dry and harsh, steam the nostrils more frequently as directed above, until a free discharge sets in, and then continue less frequently. If the throat is sore, as shown by difficulty in swallowing, an external stimulant will be desirable, as the ammonia and oil liniment or a mustard poultice applied and well rubbed in over the whole region of the throat. If the cough becomes troublesome mix one dram each of extract of belladonna and niter with sufficient sirup to form a thick paste, and rub well upon the back teeth to be slowly swallowed at leisure and repeated three or four times daily.

The diet should be light and laxative in Summer, consisting mainly of green food and mashes, and in Winter scalded oats, linseed gruels, roots and warm mashes. Allow free access to pure, cold water. If the bowels continue costive, give copious warm water injections every three or four hours until relieved. During treatment the animal should have walking exercise for a short time daily when the weather is suitable. When recovery is slow it may frequently be hastened by mildly stimulating tonics, as an ounce each of powdered gentian and sweet spirits of niter given twice or thrice daily in a bottle of ale or cold water.

Since a cold can usually be avoided by proper attention to the care of a horse, it saves much needless trouble and is safer to take all reasonable precautions to prevent colds. Stables should at all times be dry, warm, light and clean, free from direct draughts of air, but at the same time well ventilated. During damp, cold or windy weather a horse after exercise, whether stopped in the road or placed in the stable, should have a warm blanket applied. Standing uncovered, even for a few minutes, in the road, is often sufficient to contract a severe cold. A blanket for the purpose should always be carried at this season of the year to have ready for use when necessary.

Upon putting the horse in the stable after a drive, a blanket should usually be applied for an hour or two, even if the animal does not appear warm. When exercised so as to be perspiring freely or much fatigued it should be vigorously "rubbed down" until dry before applying the blanket. For a horse that is blanketed in the stable or has been clipped, even greater precautions are necessary since he will more readily take cold. Horses at pasture should be taken up or provided shelter on wet, cold or windy nights of Autumn and Winter. When an animal has been unavoidably exposed, a severe cold may frequently be warded off by thoroughly "rubbing down" at night, applying a blanket and giving a hot mash with two ounces of ginger or 25 to 30 drops of tincture of aconite with an ounce of niter.

In such cases special care is needed for the next two or three days that a fresh cold is not added to a system already weakened by the first attack.

Sheep Husbandry.

Notes from the Western New York Farm.

SHEEP BREEDING.

WHEN TO COUPLE.

WHAT time in Spring should the lambs be dropped? What shall guide us in the selection of the ram? How many ewes should he serve? How long can a ram be profitably used in the same flock? These questions cover the ground of inquiry in a score or more of letters recently received, which show the wide and growing interest in sheep husbandry, and which can be answered only in a general way.

THE COMMON PRACTICE, no matter what the latitude, is to have the lambs dropped at just about the time the sheep are turned out to pasture, the belief being that the grass exerts a loosening and cooling influence upon the ewes, and that less loss of lambs will occur and that the lambs will then do their best. While it is a fact that the grass does have this effect and that sheep wintered in the usual methods, in open yards with nothing to eat except dry hay or corn fodder and straw and in many cases mostly straw, and with a very scanty supply of water and no grain, will not be in very robust condition nor give a great abundance of milk, it is no less true that when, as is commonly the custom, they are turned abruptly from the yards and dry feed to the fresh grass, the first effect is, by its laxative influence on the bowels, very weakening and the ewes are less able to bear the strain of parturition than before the change was made. Besides, at this season the weather is very changeable: the brightest morning is liable to be followed by a snow or hail storm, or, what is fully as bad, by a cold rain or a piercing cold wind, and, further, when the sheep are out in the fields they cannot be as closely watched, and if, as is often the case, a ewe needs assistance, she is not seen in time, and, if seen, is not easily accessible to the shepherd. The result is the loss of the lamb and too often of the mother also. That this plan is not a success is evident from the very large proportion of "dry ewes" found in every flock so treated, and from which we select in making up our flocks for winter lamb raising, and, yet, as bad as it is, this method is to be much preferred to having the lambs come amid the snows and blizzards, or during the pinching nights of the earlier Spring with the sheep running in open yards sheltered only by the fleece or the remnant of the straw-stack. This is abundantly proven by the scores of lambs whose dead carcasses bleaching on fences and in tree tops are signs of the idiocy or cruelty of the owner, which should consign him to the asylum or gaol.

When sheep are treated in Winter and Spring as above, the better way is to postpone the lambing season until after the sheep have been to grass several weeks or until the system has become regular after the change, and the ewes have begun to gain a little in flesh; in this latitude not sooner than the last of May. If the sheep are then, as they should be, yarded every night and on stormy days, and, better yet, given a moderate ration of grain, there need not be a loss of two per cent of the lambs, and the lambs will start off to growing at once and be larger when September and weaning time come than those coming earlier, under adverse circumstances.

* * *

THE LESS COMMON PRACTICE, but by far the better way, is to have the sheep warmly housed, and the lambs come very early, as early as the last of March or first of April. Among the advantages of this method are the following: The sheep are then under the constant supervision of the shepherd and are easily caught in case any one should need assistance in parturition; they can be fed so as to control the conditions of the system, so as to have them most favorable to both mother and offspring; there is no danger whatever from storms, cold or wind either to the ewes or lambs; the ewes are stronger, the lambs get started in growth, and the ewes recover from the severe strain and when turned to grass, both are in condition to thrive right along. Early lambs are usually in demand for slaughter at a price that pays several times the profit on the later ones, and even if not so wanted they will be much larger in Fall and in better condition for winter feeding, and will command for this purpose at least a half dollar more per head than the later ones. But if wanted for neither of these purposes, they will stand wintering much better, and will each give a fleece of a pound more wool. Besides all this, the lambs will be in weaning condition so much the earlier that the ewes, being relieved from their support, will get in much better condition for the succeeding Winter, or if wanted for the market they will be in better flesh and at an earlier date.

The barns for this purpose should be warm and dry, but need not be expensive or large. They can be made of stone, boards and paper, or, in the Far West, of poles and the straw that otherwise would be burned. They need not even be large enough for the entire flock, as the pregnant ewes may be sorted out from time to time, as they come near the end of their period, and put into the warm quarters, and the older lambs with their mothers removed to others not quite so warm. Besides the warm quarters, if the best results are desired, some sort of succulent food must be provided. Silage will answer; rutabagas or carrots are good; if nothing else is available, it will pay to feed a few potatoes at this time, even if they are selling for a half dollar per bushel. But nothing else that I have ever tried is quite so good or can be so cheaply provided as mangels of some variety; they are easily and cheaply grown; they keep better than any other root and the sheep like them well. This succulent food should be fed for at least two weeks prior to the birth of the lamb, and should be continued until the ewes are turned to grass. It will pay every sheep feeder to give it to his whole flock at least twice a week during the whole Winter, and better if fed every day. It has a wonderful effect in keeping the bowels open and regular and in keeping down any tendency to feverishness, and it adds greatly to the power of the system to digest and assimilate the dry food, and with a breeding ewe insures a full supply of milk and that of the best kind for the newcomer.

In addition to their other food, pregnant ewes should have daily a little grain. If a gill is fed each day it will be no more than three pecks for the Winter, and its cost will be returned in the growth of wool and carcass of the ewe, in the increased strength and rapid growth of the lamb and, again, largely in the increased value of the manure. When fed for this purpose and to this amount only, almost any grain may be selected that is cheapest; or a mixture containing any one of the grains and bran and oil meal would be capital, and the quantity could probably be increased without additional cost, and when such is the case it should be done.

* * *

THE COUPLING OF EWES AND RAMS then is a matter to be decided after carefully considering the advantages and disadvantages of those methods of lamb raising and choosing which will be followed, remembering that the average period of gestation in the ewe is from 150 to 153 days, or, in round numbers, five calendar months. If then the lambs are desired at or soon after the middle of March, the time for putting the ewes and rams together would be the fifteenth of October. If, on the other hand, the lambs are to come after turning to grass at the very last of May, the putting in of the rams must be deferred till the last of December, and so of any intermediate time. I would advise either the one or the other of these extremes.

* * *

We have now (November 15) got our sheep into the barns and are sorting out such of the ewes as have failed to get with lamb. To do this we put the rams for a short time each day into each pen, having first applied Venetian red to their breasts. When we wish to carry these ewes over for next year's use we have them served with Shropshire or Hampshire bucks; but when we wish to sell them to our neighbors for store stock, we apron some common ram so that he paints the ewe without service. As soon as a ewe is in either case painted she is thrown out. A week of such treatment sorts out 98 per cent. of the unimpregnated ewes. J. S. WOODWARD.

Veterinary.

THE ORIGIN OF CONTAGIOUS DISEASES.

S. H., in an article in the RURAL of Nov. 20th, gives his views as to a possible origin of contagious diseases of man and animals, and as is commonly done by writers holding similar views, misrepresents the position taken by veterinarians and physicians with reference to the origin of contagious diseases. The very worst of sanitary conditions has never been known to produce the much dreaded Asiatic cholera, small-pox, yellow-pox, etc; and all precautionary sanitary measures by physi-

cians and boards of health are taken, not to prevent a spontaneous development of these diseases (an occurrence that is not expected) but to remove a medium—filth—that would favor the dissemination of the disease germ when once introduced from without. Individual precautionary hygienic measures are also taken that the system may be kept in a healthier condition and thus be the better able to resist the attack of any disease germ. Unhealthy, filthy surroundings always favor the spreading of these contagious diseases, but they do not in any case develop the germ of the disease. What is true of the sanitary conditions for man is equally true of those for animals.

Veterinarians do not attempt to explain the origin of the special contagious disease germs now known. Nor do they deny that the germs of pleuro-pneumonia contagiosa, swine-plague, etc., may not have originated spontaneously by some process of development. But they do claim that at the present time, the germs of these diseases are not developed spontaneously, and are not known to have been so developed within the history of these diseases. They do not base their claim upon pet theories, as in the case of the above writer and others, but upon the facts in the case. There is not an authentic instance on record in which these diseases have been known to originate spontaneously, while there are innumerable facts to show that they are not so developed.

Pleuro-pneumonia was unknown in this country before its introduction into Rhode Island in 1843 with an imported Dutch cow. It was carried to the Cape of Good Hope in 1854 and to Australia in 1858, in each case with imported infected cattle, and in both countries it was entirely unknown until its introduction with these diseased animals. The history of the spread of these diseases very plainly indicates that it is only by the movement of infected animals or their products that the diseases have spread from one locality or country to another. Numerous similar instances might be cited with this and the other contagious diseases, if space permitted. If contagious pleuro-pneumonia can now be developed spontaneously, why was it not so developed in this country prior to 1843, and in Australia prior to 1858? Perhaps S. H. can satisfactorily answer this question.

The comparison of the above writer, of the origin and spread of contagious diseases to fire and its origin by chemical action, seems to me to be wide of the mark. Chemical action between inorganic constituents always produces inorganic substances or compounds, and in no instance is it known to produce organic bodies or life.

The cause for the prevalent belief "that there must be a germ from which everything grows" is to be found in the fact that at the present time the only known organ of organic life is from pre-existing organic life, and that all newly developed life follows the well-established aphorism that "like produces like" within the limits of certain laws of slight variation.

The question at issue is not so much as to whether these diseases can be developed spontaneously, but as to whether they are so developed. Surely the history of contagious diseases very plainly shows that they are not being spontaneously developed.

A VETERINARIAN.

The Poultry Yard.

WINTER WORK IN THE POULTRY YARD.

THOSE who have to pay the food bills for a flock of poultry during Winter are mostly interested in the quantity of eggs that are gathered daily into the egg basket. During Winter when the ground ceases to supply worms, etc., the birds are dependent entirely upon those who care for them, and such persons should be properly qualified by a thorough knowledge of the requirements of the fowls. Good feeding is indispensable. A large proportion of food is consumed in cold weather merely to keep up a normal animal heat, after which comes the natural waste of the system before any part of the food can be spared for forming eggs. This is one reason why hens stop laying during very cold spells. As the days are very short, fowls should be fed as soon as it is light enough for them to see to eat. The best way to be early is to scald or cook the food overnight, cover it up and keep it in a warm place till morning. It can then be fed to the flock quite early. Early and late feeding gives better results than late morning and too early evening meals. Warmth and ventilation must receive due care. Provide a good dust bath of sand, ashes and a little flowers of sulphur. The box if one is used, should be sunk in the ground to a level with the floor close up to a low window so that the sun will shine into it.

A good shed, dry and open to the south, should be attached to every poultry house where many hens are kept, so that they can enjoy the fresh air and keep out of snow and wet. This reminds me of the bad effects produced by fowls eating snow or drinking snow water, which frequently causes diarrhea and for some reasons the birds that indulge in this practice, even when no diarrhea shows itself, get very thin and out of condition. Of course, one cannot entirely prevent fowls from eating snow, but they are creatures of habit to a surprising degree. If we neglect giving them fresh water promptly, they will soon contract the habit of eating snow and even if they are offered water afterwards they will care for it less than if their daily habit of drinking had not been broken up by carelessness. If, during cold weather, one gives them water with the chill just off, they will appreciate it and seldom eat much snow. During cold spells when stock are confined, they must be kept scrupulously clean, and a handful of air-slaked lime should be dusted around inside the houses every day or two, and at night when the birds are settled drop a handful under the perches, especially if any strong smell is noticed in the houses. Every few weeks treat the perches to a coat of crude petroleum. See that the nests are clean and inviting. Some may say there is a great deal of trouble in all this. Well, there is considerable labor; what can succeed without it? The fowls have to be fed all through Winter under any circumstances, and with too little care no eggs can be expected. Now, which pays the better—to have the expense and no eggs, or to take proper care and get eggs while they are dear? This can, without doubt, be done by following the advice here given:

Fowls to lay must be in good condition, not fat; but bright, cheerful and lively. If your fowls are out of condition you must keep up this good feeding, etc., till they are in good order. They will soon let you know that this is the case by their pruting and liveliness when they are preparing to lay. I have known some persons whose hens were out of condition from neglect, to start feeding them properly expecting them to lay at once. This is too much to expect. Anyone accustomed to poultry can tell at a glance the condition of a flock. There is always a demand for fresh eggs in Winter, and anyone having a good flock of early pullets and giving them the necessary care, can hardly fail of being repaid for the trouble.

WINTER LAYERS.—Strange to say, my wife's hens lay as many eggs in the Fall and Winter as they do in Summer. We keep about 30—all our own raising—mostly Plymouth Rocks. The habit of winter laying may be partly bred into them, but they are well cared for, too. They are kept in a corner of the barn, on the same side as the cows and calves. In the morning they have a mush of meal, table scraps and a little bone meal sprinkled on top, sour milk in abundance and ground oyster shells every other day. For supper—for we feed but twice a day—we give whole corn roasted in the stove oven. The hens run in the barn for exercise, and on this feed, shell out the eggs.

Dairy Husbandry.

THE REFORM OF IRISH DAIRYING.—III.

PROFESSOR J. P. SHELDON.

Irish dairy schools; female students; male pupils; butter-making competition; creameries; shortcomings of small farm butter; no cheese worth mentioning.

TWO ways there are, standing out above the rest, by which the friends of Irish farming hope to accomplish the reform I have alluded to in previous articles—the reform of Irish dairying, particularly in reference to butter-making. These are dairy schools and creameries. I have aforetime spoken in the RURAL on the subject of Irish dairy schools and have had occasion to express a high appreciation of the good they are doing. There are two of these schools, between which a friendly and beneficent spirit of rivalry and emulation exists—one of them near Cork and the other near Dublin. The former has been established some years, under the help and patronage of leading persons in the south, and is known to the world as the Munster Dairy School. The latter is a recent addition to the well-known Agricultural College of Glasnevin. Not only butter-making on modern principles, by the aid of the latest and best appliances, but also the production of milk and the management of cattle are taught and demonstrated at these establishments.

The female students, as a rule, confine themselves to butter-making and general dairy management, though there are exceptions to the rule. It is known that on the small farms in Ireland the women have more to do than the men with the management of cows, so that it is well even for female pupils at the school to go in for the whole curriculum of the place, in view of possibilities in the future: and it may be said, in fact, that all dairymaids would be the more capable if they understood something about the management of the cows that give the milk. I am acquainted with instances in which workingmen's wives have the management of a cow or two on their own allotment of land, and it is almost invariably the case that such cows make a much better return in milk than they would if ruder and rougher man had been their keeper.

The male students or pupils of the dairy schools are chiefly interested in the management of cattle and land, though no doubt, some of them will pay diligent attention to the tuition which is offered to them in butter-making, and this with the view of becoming managers of creameries, or being the better able to superintend dairies of their own.

Be the objects of the pupils what they may, it is certain that the Irish dairy schools impart sound tuition to the pupils. On several occasions I have had the privilege of officiating as a judge at dairy shows held under the auspices of the Royal Dublin Society and the Royal Agricultural Society of Ireland, whereat butter-making competitions have formed the most attractive, and, at the same time, the most useful features in the display; and I have been struck with the marked skill and singular deftness of those who had passed through the schools, when compared with those who had not. So long as butter continues to be made in farm-houses, in Ireland, the dairy schools may continue the excellent work on which they are engaged, and we may safely come to the conclusion that farm-house butter-making will never die out in that country. The large dairies of 50 to 100 cows, or upwards, can afford the services of skilled dairymaids, and it is for such dairies that a brisk demand exists for girls who have been trained at the dairy schools. Daughters of large farmers find no loss, but rather a gain, of dignity in becoming pupils at the schools, and I discern in this a principle very promising indeed for the future of Irish dairying.

The factories or creameries are advocated on behalf of the small farmers who are so numerous in Ireland, and who have no suitable conveniences for making butter as it ought to be made, and not for the large farms where modern arrangements and appliances have been adopted. An Irishman is an Arab in his love for a horse, and, therefore, the conveyance of milk to the factory is known to be a feasible thing. The chief difficulty lies in getting the farmers to give the new system a trial: though, so far as this is concerned, there is less stupidity among Irish than among English farmers. The small farmers who fill one, two or three firkins a year, have been getting about eight to 12 cents a pound for their butter, while the large farmers have been getting twice, or more than twice, as much; and it is the object of the promoters of the creamery system to do away with this disparity and to place the small farmer more nearly on a footing of fiscal equality with the large one, so far as the price of butter is concerned.

Irish butter is seldom wanting in quality, body and color; but it is sadly wanting in uniformity. It needs making in a manner which modern practice has perfected, and on a large scale, either in creameries or on large farms. The small farm system is hopelessly out of the running, so far as the race for popularity in butter-making is concerned, and the sooner it is merged in the creamery system the better for all concerned. Ireland will remain a great butter-producing country, and I have a sort of conviction that her climate and soil are such that she can produce the best butter in the world, if only she makes it on sound principles and in a careful and cleanly manner. There is, indeed, no great obstacle in the way; and Ireland, if she will, may win back her ancient reputation for butter. Cheese is made only to an extent which deserves no mention, in Ireland, but it is at the same time true that the country will produce cheese of very fine quality and character. Cheese-making, however, has never been a recognized industry in Ireland.

ORIGIN OF THE CHEESE MITE.—It has long been supposed, says the Popular Science News, that the minute animals carried about by the common fly were parasites drawing their nourishment from him and in part repaying him in his own coin for the annoyance he inflicts upon the human race. We are now to be denied this thought of revenge. According to the study of P. Meguin, a French naturalist, these animals are nothing but the common

cheese mites. It was found that as long as abundant food was supplied these mites flourished. When the supply decreased the very young and very old individuals died, while the others changed their forms, becoming smaller and of a different shape. The abdomen under the influence of the fast became concave in shape so that it will readily adhere to other bodies. When the fly carries one of these insects to a fresh piece of cheese or other agreeable food, it detaches itself and grows and multiplies. Thus these supposed parasites are only tramps which "beat" their passage on the fly's back. Instead of causing the fly trouble they only enable him to do more mischief than ever.

A BUTTERINE DEFENSE ASSOCIATION has been formed in England. Butterine is to be defended. Its makers do not want its name changed to oleomargarine. The stuff is, of course, praised as wholesome, good and vastly superior to badly made butter. There is no reason why butter should be badly made. If the butterine people are so exceedingly anxious that the public should be held away from bad butter, there is a better way for them to go to work than to try and get butter prices for lard.

Field Crops.

Experiment Grounds of the Rural New-Yorker.

NEW POTATOES.

THE RURAL NEW-YORKER POTATO NO. 2.

SEVERAL references have been made to this new potato which originated at the Rural Experiment Grounds several years ago. No record has ever been kept of the varieties from which seeds have been sown, since cross-breeding is practically impossible here, as seed-balls form rarely, and we have never been able to find any pollen. Every year for many years a few seed-balls have been gathered and the seeds have been sown in pots or boxes late in February. The thriftiest plants have been transplanted into thumb-pots in April and in late May set out in the garden. By this time the roots penetrate the soil so that the plants are easily thumped out into the well-prepared soil of the garden and they scarcely feel any change.

We have met with little success in seedling potato culture, the No. 2 being the first that has been deemed worthy of introduction; but *this* bids fair to repay us for all our trouble, being one of those marked advances in the improvement of varieties which seldom occur. Nevertheless a trial of this potato in different parts of the country may show that it is not adapted to general cultivation. As it grows here, however, in our rich garden test soil it is, as has already been stated, the nearest to a perfect potato of any of the 600 varieties which have been raised during the past 12 years. The entire crop was the product of 53 pieces planted in trenches three feet apart, the pieces one foot apart in the trenches. The weight of the crop was 120 25 pounds, which is at the rate of 881.83 bushels (of 60 pounds each) to the acre. Many kinds of potatoes have yielded more in this rich, mellow soil; but for uniformity of size and shape, for beauty of shape, smoothness of skin, fewness of eyes and for the remarkably small number of under-sized potatoes, this variety has never been equaled here. There were but 187 potatoes, and of these all were marketable and, indeed, of nearly the same size, except 22. In hundreds of the new kinds tested here, there is little to distinguish one variety from another. They might all be sold under the same name. But if these (No. 2) were mixed up with 100 different kinds, we think that every one could be picked out, so marked are its peculiarities.

The engravings before us (front and side view), Figs. 456 and 457 (see page 839), were drawn from rather the *poorest* than the best specimens that might have been selected, and they show also the *average* size. Few were larger, few smaller, except the 22 above noted, which were scarcely larger than big marbles. As has previously been stated, we propose to send a small tuber of this R. N.-Y. No. 2 to all applicant subscribers as soon as the supply shall enable us to do so. This will probably be in 1888. * * *

THE PECAN POTATO. Received from L. M. Macomber, of North Ferrisburgh, Vermont, who writes: "The seed was given me by C. G. Pringle, of Charlotte, Vt. It is a little later than Snowflake. The seed was sent to me by J. T. Macomber, of Grand Isle, Vt. It is rather late, keeps better and yields about the same as Snowflake."

We planted six pieces April 12. The vines were dead August 15. The yield was 21 pounds, or at the rate of 847 bushels per acre. The whole number of potatoes was 115, of which 91 were of marketable size. Shape, flattened, elliptical, as our engraving shows; buff skin, russeted; very few eyes and those even with the surface. A perfect potato as to shape, and we cannot speak too highly of its quality. The best five weighed two pounds, six ounces. The average size is rather small, perhaps, for market popularity, but not for family use. It is a potato that peels with little waste, there being no deep eyes to cut out (See Fig. 458, page 841).

* * *

CHARTER OAK, from Peter Henderson & Co., of New York. Planted April 12: vines died August 12. Four pieces yielded 13 pounds, or at the rate of 786.50 bushels per acre. Best five weighed two pounds. It is of the Peachblow class. Roundish, often russeted, eyes quite shallow, buff skin, eyes often pink. A shapely potato of its kind. Whole number 58—40 marketable. Slightly yellow flesh, mealy, dry and somewhat nutty. Eaten Oct. 26. * * *

CHARTER OAK, third trial from Rural stock. This potato was originally sent out by B. K. Bliss & Sons in 1884, It is a fine keeper. Planted April 20—vines dead August 10. The yield of four pieces was 13½ pounds, or at the rate of 816.75 bushels per acre. Whole number 67—marketable 46. Best five weighed two pounds 1¼ ounce. (See illustration from nature, Fig. 459, page 841.)

GARFIELD AND SNOWFLAKE POTATOES are selling for the best prices for Boston market in this vicinity. These bring 50 cents per bushel. A choice lot of Garfields are being held by a party near here for 75 cents, as good ones are becoming scarce. Burbanks sell at 35 cents to 40 cents, with same price for Late Hebrous. The Chas. Downing, a new potato, will be sure to take. O. H. ALEXANDER.

Farm Topics.

CORRESPONDENTS' VIEWS.

FARMERS' CLUBS.—Our Farmers' Club is about one year old. It has been very successful. In organizing it we tried to be as simple as possible. We have no such thing as a constitution. Perhaps we should be ashamed of our poverty, but such is the fact. We have a few rules, by-laws, if you would dignify them with the name—stating when the regular and annual meetings are to be held and the membership fee. Of course, we intend to conduct our business and discussions in a parliamentary manner and Cushing's Manual tells how to do it. It was thought best not to hamper ourselves by a long constitution, and we have as yet had no reason to regret the decision. To what do we owe our success? To the interest, enthusiasm and work of our charter members. We started with only 12 men, but each of them resolved to do his best to make the club a success. Soon we were aided by new members, until now we have a membership of over 30 and no effort is required to make each meeting interesting and profitable. The material of which the club is composed is such that there is no danger of our becoming a mutual admiration society; on the contrary, scarcely a subject is discussed that does not elicit some pretty sharp opposition among the members. In this way the facts of the case are generally reached. We have now just taken up the question, "Which is the most profitable cow for the farmer?" and have requested essays from any and all prominent breeders. Smiths, Powell & Lamb have given us an excellent one on the Holstein. The Devon and Guernsey are equally well represented by Rumsey Bros. and Mr. Ledyard of Cazenovia. The Jerseys, Herefords and Short-horns are to be heard from. These papers will be read and published with our reports, and then one meeting will be devoted to the discussion of the subject. If a word of advice to younger clubs is allowable, I would say: Be sure that your officers are workers and men who will always be present. Let all things be done with dispatch, for rather a half hour meeting and a lively one than one that drags out a tedious two hours. A live farmers' club is a blessing to the community, but an inactive one is a curse.

Auburn, N. Y. D. P. HARDY.

R. N.-Y.—The Cayuga County Farmers' Club is a success. We like the idea of making the organization as simple as possible. Many new clubs will be started this year. It is well to avoid a cumbersome constitution if possible.

A MODEL HIRED MAN.—There has been considerable talk in the RURAL of late about the hired man. One woman recently urged all farmers' wives to protest against boarding him, saying that the average hired man is the most provoking element the housewife has to contend with, that a home can't be a home where he is, etc. Now I am a hired man and I don't like to see myself put down so low as all that. I have been working at my present place for the past four years, and have boarded with my employers constantly. Women who have so much trouble with hired help must have been old maids before they became farmers' wives, or else they were brought up in the city. Either this or they have got about the poorest help in the world. I should be much surprised to hear my mistress say that my washing and ironing are a burden to her. Instead of increasing her work I study to lighten it. I am usually up first in the morning—always when the mistress wants to go to church—build what fires are needed, fill the tea kettle, put water in the potato kettle and get it over the fire. Then I do my chores before breakfast. I mash the potatoes, bring in wood and always make it a point to see that the water pail is never empty when I am near the house. I also help scrub the kitchen floor, make flower-beds and keep generally on the watch for work that might lessen the labor of my mistress. I get full pay by always feeling that I am just exactly as welcome as any member of the family ever could be. People may think I work in the house instead of on the farm, but I drive a good team of horses through all the work they can do. While my team is eating, or after the day's work is done, I feel that I can do a few little jobs about the house just as well as I could spend the time leaning over a fence or growling because dinner is not ready. If some farmers' wives did not feel so far above the hired man, and would ask him kindly to aid in the work, they would find that their work would be greatly lessened.

Avoca, N. Y. J. W. B.

WE want to hear from the huskers among the RURAL'S readers. What do they wear on the hand to tear the husk apart? Here we use the stick across the fingers; the point to meet with the thumb. A good husker here handles 20 to 40 bushels of ears per day, according to the corn. CHAS. MUNGHAM.

Lambton Co., Ont.

I WAS just getting enraged with the picture of "A Scrub Cow" in a late RURAL, and with the artist who drew it; as the miserable face and framework excited my pity, and I was about to take up the cudgels in her defence when a word or two of the editorial comment caught my eye, and then I wanted to thank the writer. God Bless you, Dear Sir! and all those who really know that much may be done by editing a newspaper, to prevent our choosing Barabbas, and hanging the wrong man. JAS. B. OLCOTT.

South Manchester, Conn.

Farm Economy.

THAT MANURE QUESTION.

I HAVE just read, on page 656 of the R. N.-Y., Mr. Stewart's exposition of that manure question, and am very much mystified for the following reasons: He states positively that manures do not leach through soils. I had been led by observation to believe that they did—through some soils at least—and for that reason have hesitated about digging a well close by my stable, though I should very much like to do so.

A farmer living near me dug a well 25 feet deep close beside a yard used for cattle and pigs, and into which all stable and other manures were thrown, and though he formed a bank two feet high and several feet wide around the well, with the clay taken out of it, the water became discolored and unfit for use the third year after it was dug. He then moved the cattle yard and manure heaps a hundred yards away and within three months afterward the water in the well became, apparently, pure and fit for use.

Again, in January, '84, I drew out a quantity of mixed manures and piled them up in a heap to rot. As it happened, the heap was located over a tile drain, 400 feet from its outlet. This drain had been laid two years and was three feet four inches deep—soil heavy clay loam. As the ground thawed out the following Spring, the water flowing out of the drain became discolored and continued so nearly two weeks, and I noticed that the weeds along the ditch into which the drain emptied grew much more rank that Summer than ever before.

Once more, I have a tile drain laid three feet deep under my stable. The outlet is 320 feet distant. Every Spring the water flowing out of this drain is discolored, but only for a short time after the ground thaws out, and the weeds that spring up about, and for some distance *below*, the outlet, plainly show that they derive "encouragement" from some source.

After reading Mr. Stewart's article I must confess my inability to understand how these things can be. And yet they *are*! I would like to have some of the RURAL readers try this experiment, viz:

When the ground is frozen solid, cover one square rod two inches deep with barnyard manure, and another square rod to the same depth with straw, and next Spring note which plows up the lightest and is the most friable, and report to the RURAL. See that neither plot is trampled after the ground thaws until the plowing is done. FRED GRUNDY.

Christian Co., Ills.

[The manure question raised by our correspondent is well answered by Sir J. B. Lawes's article on page 766 of the Thanksgiving Number.—EDS.]

ADVANTAGES OF FALL PLOWING.—I am in favor of fall plowing, though many potato growers say it is a waste of time. Last season part of my ground was fall-plowed and replowed in the Spring. It is all a sandy loam—one portion as rich as another. Each part received the same cultivation. The advantage of early planting was with the spring-plowed plot. Potatoes of both early and late varieties were planted. In every instance and with all varieties the fall-plowed land produced the finest tubers, and a fourth to a third more. Some varieties fully doubled. The fall-plowed land was in much the finest condition—very fine and friable; and who knows but a beneficial chemical action is produced in the freezing of the upturned soil? And then the manures and fertilizers used are turned towards the top by the spring plowing, and made much more beneficial by the driving spring rain.

Bureau Co., Ills. J. W. BAKER.

Horticultural.

SOME NOTES ON TOMATOES.

MIKADO TOMATO.—Not only is Turner's Hybrid the same as the Mikado, but so too is General McClellan.

FARQUHAR'S FAULTLESS TOMATO was the earliest of all the varieties I grew this year, and it showed this early character very decidedly not only in ripening but in going past. But, as an outdoor summer variety, its small size and uneven form will ever render it unpopular.

THE BEST TOMATO I had this year was from Hallock & Thorpe, and it originated with Reed & Hummel of Huntington, L. I. The fruits are of good average size, round, smooth, very solid, and the core is quite soft; the skin is bright red. It is a capital bearer. Its bright color, even size and beauty altogether are not eclipsed by any other sort I have grown. Mr. Reed assures me that it is earlier by several days than any other variety, but as I did not get it till too late to include it in my trial of tomatoes, I cannot of my own experience give an opinion on its earliness.

LIVINGSTON'S BEAUTY.—What have we gained in this newcomer? Livingston's Perfection is a beauty; this, in my opinion, is no better; but, on the contrary, its Acme-tinge must weigh against its popularity.

AMONG OTHER TOMATOES we cannot renounce old Trophy, it is such a sure cropper and less apt to rot than most other sorts; and by careful selection seedsmen have much refined and evened its former appearance. A variety of it with bronze-green leaves is equally good with the typical form. Improved Queen, Essex Hybrid, Emery and many others in my trial ground have behaved quite meritoriously.

YELLOW TOMATOES.—I had Golden Queen from Rawson of Boston, and really it is one of the prettiest tomatoes I ever saw—such a clear, yellow color, and smooth, even form. The fruits are of medium size, and the crop heavy; but there is no demand for yellow tomatoes. WM. FALCONER.

POISONING CABBAGE ROOTS.—One experiment last season cost me dearly. I wanted to kill the maggots at the roots of my cabbage and cauliflower plants, and invented a remedy. (?) I made a puddle of dirt and water, mixed in a small quantity of insect powder and Paris-green, and dipped the plants in the mixture before setting. They never made the least mite of growth, but gradually dwindled away. I had literally poisoned the plants to death with the Paris-green. I had a curiosity to learn what effect Paris-green would have on the roots of plants. I had no idea that the poison would have taken effect so soon, as I had often read that Paris-green was not soluble, and that the roots of the plants would not assimilate it. I wish some one would experiment in this matter, and examine the roots with a microscope and see what the effect is.

Glendale, Mass. J. H.

[A too-large proportion of the green mixed with plaster will kill the leaves of potatoes; why not the roots as well?—EDS.]

What Others Say

SHEEP EXPERIENCES.—Mr. Davidson, of Charlton, N. Y., favors the Farm Journal with some of his sheep experiences. He began with full-blooded Merino ewes and crossed them with a Leicester ram. This was in war time, when coarse wool was the most in demand. This cross made large sheep and he sold some for $10 a head. He crossed these Leicester-Merinos with South Downs, and kept these cross-bred sheep until three years ago, when he got a Golddrop Merino ram and bred a flock of Merino-South Downs with a little of the old Leicester cross in them. He saved 16 ewe lambs of this cross and they are the best sheep he ever had. They all have white faces, are square-built, broad, short-legged and wonderfully hardy. They are grand sucklers. The lambs sell for almost as much as the all coarse-wooled, and they shear more wool. The first year the whole 16 only lacked one pound and a half of shearing seven pounds each of washed wool without any tags in it. The next year they averaged 6½ pounds. These lambs and sheep were wintered on hay alone. The wool is nearly three inches long and brings the highest price. One buck lamb was wintered and killed in the Spring, and his pelt when dry weighed 21 pounds. His notion is that the best way is to use a Merino buck on coarse-wooled ewes. In this way one gets more fleshy and compact lambs, and such will be ready for the butcher sooner than the cross the other way. Then, again, the ewes will afford more milk and the lambs will grow faster. If grain is fed to sheep it must be fed with care, or it will do more hurt than good. Sheep should be fed regularly with food which is suited to them. They will never do well on coarse or swale hay, and Timothy is not good for them. Clover is best; Red Top is good or fine, old meadow hay. They should be kept dry and at the same time they must have good air and some exercise. Mr. Davidson lets his sheep out into the yard every pleasant afternoon, and all the rest of the time keeps them in a stable where they are dry. They should have water whenever they want it, and not be made to get very thirsty and then given all they will drink. This excess of cold water chills them and is liable to bring on stomach troubles. His sheep make the best of mutton and they will weigh, alive, from 130 to 150 pounds. He recommends farmers to use large Merino bucks on the coarse-wooled ewes in order to get a more hardy and better sheep.

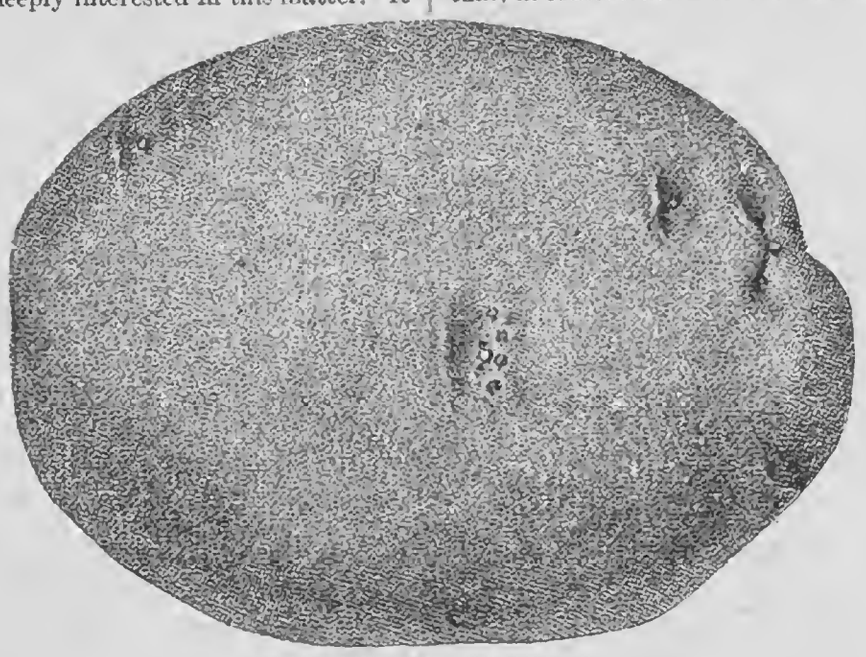
THE PUBLIC DOMAIN—ALIEN LANDLORDISM.—"The rapid appropriation of our public lands," says the President in his message, "without bona fide settlements or cultivation, and not only without intention of residence, but for the purpose of their aggregation in large holdings, in many cases in the hands of foreigners, invites the serious and immediate attention of Congress. I recommend the repeal of the pre-emption and timber culture acts, and that the homestead laws be so amended as to better secure compliance with their requirements of residence, improvement and cultivation for the period of five years from date of entry, without commutation or provision for speculative relinquishment. I also recommend the repeal of the desert land laws unless it shall be the pleasure of Congress to so amend these laws as to render them less liable to abuses." For years we have had reports on reports, and recommendation after recommendation on this subject, yet what has been done to remedy the abuse? If the fault is in Congress the people should know it, and apply a remedy themselves, by sending better men to better represent them.

CONTAGIOUS PLEURO-PNEUMONIA.—After several good words, in a rather vague sort of way in favor of the labors of the Agricultural Department, President Cleveland says:

"The existence of pleuro-pneumonia among the cattle of various States has led to burdensome and in some cases disastrous restrictions on an important branch of our commerce, threatening to affect the quantity and quality of our food supply. This is a matter of such importance and such far-reaching consequences, that I hope it will engage the serious attention of Congress, to the end that such a remedy may be applied as the limits of a constitutional delegation of power to the General Government will permit." Yes, and let us have prompt action on the matter.

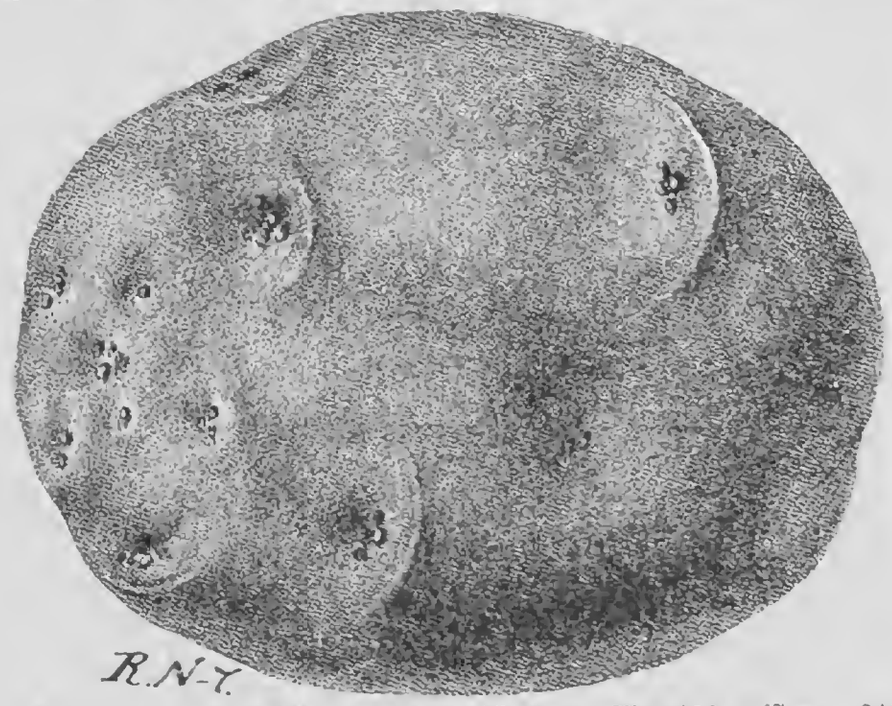
INTER-STATE RAILROAD REGULATION.—"By a recent decision of the Supreme Court of the United States it has been adjudged that the laws of the several States are inoperative to regulate rates of transportation upon railroads, if such regulation interferes with the rate of carriage from one State into another. This important field of control and regulation having been thus left entirely unoccupied, the expediency of Federal action upon the subject is worthy of consideration." So says the President's message. The whole country, every industry in it, demands better regulation of transportation facilities. Congress cannot be too prompt in acting in this line.

THE SILVER QUESTION.—In Secretary Manning's report the subject given greatest prominence in place and space regards the silver question—"the opening of the mints of the governments of the United States of America and of the leading European States to the free coinage of both gold and silver into unlimited legal tender money at a ratio fixed by international agreement." The nations of the world are deeply interested in this matter. It greatly affects international trade and domestic industry. One of the chief causes of the recent low prices of wheat in this and other countries is attributed to the depreciation in the value of silver. Silver is the chief—nearly the only—currency in British India. Hindoo ryots, or farmers, sell their wheat at a certain figure—in silver. They know and care nothing about the rise or fall in the value of silver in the world at large—it is always worth the same among their neighbors. The European dealers—almost exclusively English—buy silver in London or elsewhere at its greatly decreased value, carry it to India and pay it out for wheat at the "same old figures," and thus get wheat from 20 to 25 per cent. cheaper than formerly. They can therefore sell it much cheaper in the European markets, and, of course, the price at which India wheat is offered influences the prices offered for wheat from other countries. Of course, this can't last. Even the ignorant Hindoo ryots will, in time, learn that the price of silver varies as compared with gold; or a fixed ratio between the two will be established by international agreement. This is advocated at great length in the report. Anyhow the exportable surplus of India wheat is limited, and the recent rise in the price of wheat here and elsewhere probably shows that the end of the surplus from the last crop has already been reached.



R.N-Y.

PECAN POTATO. From Nature. Fig. 458. (See p. 840.)



R.N-Y.

CHARTER OAK POTATO. From Nature. Fig. 459. (See p. 840.)

THE WAY TO SUCCESS.—Twenty clerks in a store, 20 hands in a printing office, 20 apprentices in a shipyard, 20 young men in a village—all want to get on in the world, and expect to do so, says the Industrial Gazette. One of the clerks will become a partner and make a fortune; one of the compositors will own a newspaper and become an influential citizen; one of the apprentices will become a master builder; one of the villagers will get a handsome farm and live like a patriarch—but which one is the lucky individual? There is no luck about it. The thing is almost as certain as the rule of three. The young fellow who will distance his competitors is he who will master his business, who preserves his integrity, who lives cleanly and purely, who devotes his leisure to the acquisition of knowledge, who gains friends by deserving them, and who saves his spare money. There are some ways to fortune shorter than this old dusty highway; but the staunch men of the community, the men who achieve something really worth having—good fortune, good name and serene old age—all go on this road.

CANADIAN CATTLE QUARANTINE.—Dr. McEachran, Dominion veterinary inspector, has made a recommendation to the Government that, in consideration of the fact that pleuro-pneumonia has existed for several years in Chicago, the distributing point of breeding stock for the West and Northwest, quarantine should be established there. He has also recommended the establishment of a ninety days' quarantine south of Milk Rock in Alberta, Oak Lake in Saskatchewan and at Emerson for Manitoba, and that at these points only cattle be allowed to enter the Northwest. The Doctor left on Saturday for England, and while there will confer with the veterinary officers of the Privy Council on behalf of the Dominion Government, particularly with regard to quarantine matters. He expresses the belief that pleuro-pneumonia has been completely stamped out at Levis, but the cattle will be detained several months longer as a precautionary measure.

SPICE.

THE Montreal (Canada) Horticultural Society recommends for profit the following apples for the Province of Quebec: Fameuse and Wealthy for Winter; Duchess of Oldenburg and Yellow Transparent for Summer; Alexander for Fall. The five best for family use, named in the order of their ripening, are: Yellow Transparent, Duchess of Oldenburg, Lawrence (Fall), Fameuse (early Winter), Golden Russet (late Winter).....

MR. W. C. BARRY says, in the Albany Cultivator, that in his estimation, the comparatively new pear Superfin cannot be surpassed for flavor. It is large and handsome with smooth and glossy skin and juicy, vinous, rich flesh. The tree grows well and bears a moderate crop. The pears are too delicate to ship..

MR. BARRY praises the Pitmaston Duchess as one of the most promising among newer pears. Large, handsome and of excellent quality. The tree is not a great bearer.....

DR. LUCY M. HALL, in the Christian Union, asks us to imagine a woman with a corsage which renders a full inspiration impossible, sleeves so tight that the arms ache from pressure, 10 to 20 pounds of skirts hanging from her hips and twisting about her ankles, as many pounds of cloak suspended from her shoulders, and narrow-toed, high-heeled shoes on her feet, trying to take a six or ten mile walk! Surely Nature made a wise provision for the human race when she made women hard to kill, otherwise the world would soon be depopulated for lack of mothers.....

WASHINGTON'S last message to Congress (1796) has these words. They must not be forgotten: "It will not be doubted that with reference to either individual or national welfare, agriculture is of primary importance. In proportion as nations advance in population and other circumstances of maturity, this truth becomes more apparent and renders the cultivation of the soil more and more an object of public patronage. Institutions for promoting it grow up, supported by the public purse, and to what object can it be dedicated with greater propriety?".....

"AT all events," said a young doctor as he heard of another one of his patients' death, "I can take life easy if I am poor."—Life.....

MR. BEECHER says that the Anarchist, the Socialist, and the dynamiter are as much enemies to our state of society as in the natural world are the wolves, the bears and the hyenas. In extirpating them there is no more harm than there would be in extirpating adders, rattlesnakes and copperheads.....

The new Jessie is spoken of by Matthew Crawford and others as the most promising strawberry they have seen. We shall report next season.....

THE next number of the RURAL NEW-YORKER will be the Index Number—the last of the year. Our subscribers are respectfully asked to renew early.....

THE honest labor movement of the country has an objectionable weight about its neck in the shape of that class of "labor agitators" who do not labor when they can avoid it, says the Kansas Industrialist.....

IDLENESS and ignorance are the bane of a free country.....

THE Breeders' Gazette says that a grade bull is better than a scrub, but he is not as good as a pure-bred, and if a little of a good thing is desirable why is not as much more as possible of a good thing more desirable? .....

ORCHARD AND GARDEN reminds its readers that the amateur can get considerable enjoyment from a few fig trees in this climate. They must be raised in tubs or boxes which are to be kept in the cellar or under similar shelter in the Winter and out-of-doors in the Summer.....

THE Bredeers' Gazette believes that the $100,000 or more expended in the purchase and distribution of seeds by the Washington Seed Store serve little good purpose beyond enabling Congressmen to delude their farmer constituents with the idea that their interests are being looked after, when, in point of fact, their interests are being shamefully neglected.....

FARMERS can abolish this disgraceful Washington seeds business if they will.....

ORCHARD and GARDEN does not know of anything more suitable for a shade tree in the yard than the stately pecan. It combines shade, beauty and utility.....

T. V. MUNSON says that a pecan tree 15 years old should produce from three to five bushels of nuts, making an income per tree of $15. to $20 00.....

MR. LOVETT says that the Lucretia Dewberry is best (because it is the simplest way) grown as a trailer. But, then, he says, "a mulch of clean straw should be provided in the Spring." But this is rather expensive business.....

You haven't room for a fruit tree in your front yard? Then can't you find a place for a grape-vine?.....

THE whole country, says Harper's, rose in a cry of consternation and indignation at the crime of European Anarchists upon American soil. It was a crime at once monstrous and causeless; it struck at liberty and justice and order. It was perpetrated by the most worthless set of men who are pests everywhere and whose presence in this country American generosity has tolerated. In this country and under our institutions the crime was unpardonable .....

DR. BEAULIEU, in the *Economiste Francais*, gives the following as the amount of tobacco consumed by each 1,000 people in Europe, each year: In Spain, 110 pounds; Italy, 128; Great Britain, 138; Prussia, 182; Hungary, 207; France, 210; Denmark, 284; Norway, 229; Austria, 273; Germany, 336; Holland, 448; Belgium, 560.....

A NEW TREATMENT FOR CONSUMPTION which is attracting the attention of physicians is the injection of remedies directly into the lungs by the hypodermic syringe, the needle

of which is passed through the walls of the chest. Some very encouraging cases are reported in which the improvement is so great as to justify one in speaking of them as cures. Carbolized iodine has produced the best results.....

Everywhere.

RURAL SPECIAL REPORTS.

Illinois.

CHICAGO, Cook Co., Dec. 7.—The northwest still continues dry; in fact the areas where the ground is thoroughly saturated with moisture are the exception. It might be fairly said that dry weather extends west as far as the Pacific slope. For, up to the first of December, the rainfall in California had not yet commenced. Dry weather also is reported in Washington Territory and Oregon, and when we turn our faces eastward, we hear of a scarcity of water for stock purposes everywhere. So far the snowfall has also been light, and the ground in the winter wheat belt, north of the Ohio River and extending up within 200 miles of this city, is covered with from three to five inches of snow. Taking the country as a whole, I call it, to-day, just about as dry as it was in August and September. The absence of snow and rain, with the exception of Nebraska, has enabled the farmers to secure their corn crop in excellent condition, and new corn to-day is unusually dry, in fact, as dry as in midsummer. Its movement, however, is disappointingly small. This probably arises very largely from the inter-State demand for corn which is being absorbed at so many interior points, for home consumption, at prices much better than are offered to ship to the seaboard. This is a very strong point of the shortage of corn. There has been as yet very little new corn cribbed at railroad stations and the amount of old corn in crib of the crop of 1885 has melted away perceptibly during the last sixty days. In the spring wheat belt the severe weather which has prevailed during the last two weeks has cut off receipts considerably, but the roads are good and the weather, comparatively speaking, mild at present, and with the improvement in prices, free receipts are looked for again. The hog crop continues to come along very freely, and the opinion still prevails that we shall have our largest receipts of hogs on the winter packing during December. The high price and scarcity of corn and the low price of hogs are some of the reasons which are causing farmers to send them in so freely at present. The hog crop is generally healthy, and disease seems to be confined this year almost exclusively to parts in Ohio and Indiana. N. W.

Kansas.

WHITE CITY, Morris Co., November 25.—The worst season for five years, taking into consideration the relative condition of crops and prices. Wheat a failure; oats an average; corn a half crop or less. This is mainly a grain-growing country, but the live stock interest is advancing quite rapidly. Fruit and vegetables will do well when properly cared for, but they are raised to supply the local demand only, as yet. Prices: corn, 30 cents; oats, 28 cents; wheat, 48 cents; hogs, $3.30. E. B.

Michigan.

MARQUETTE, Marquette Co., December 1.—We had a very dry Summer here. October was very warm but about the middle of November we had some snow, and logging began in the camps. All crops were an average. Hay at the mines from $15 to $20 per ton; potatoes 45 to 60 cents per bushel; oats, 45 cents. W. F. MCC.

New York.

BORODINO, Onondaga Co., November 30.—In this locality crops have been good the past season, especially oats and barley. Apples are an exception to the general rule, although we have enough for home use. As this was the bearing year with us the trees blossomed full but fruit failed to set well. A few orchards gave some surplus for shipment. Prices range as follows: Wheat, 85 cents; barley, 55 cents; oats, 35 cents; corn, 60 cents; apples, 65 cents, and potatoes, 35 cents per bushel. Some have good crops of seed from the large kind of red clover, while the small kind failed entirely on account of a midge working in the head prior to its blossoming. G. M. D.

UTICA, Oneida County, December 6.—The cheese market to-day, the last meeting of the Board this year, had a good attendance, but sales were light. All the factories, however, will close out this week. Transactions were 568 boxes at 10⅛ cents; 125 boxes at 11 cents; 136 boxes at 11⅛ cents; 110 boxes at 11¾ cents; 386 boxes on commission. Total, 1,325 boxes, ruling at 10⅛ cents. Sales at 11 cents and up, full cream. No market at this time last year. Little Falls this week 1,939 boxes, ruling at 11 cents. The butter market is dull for all but very best grades. Little Falls sold 52 packages farm dairy at 21 cents. Farm dairy sells here for 21 to 25 cents. Best grades always wanted. No market for hops. R. L.

STRAW AS MANURE: DRAFTS OF PLOWS.

G. S. Vermontville, Mich.—1. I recently scattered a stack of straw and plowed it under. My neighbors laughed at me and said that if after having scattered it I had set it on fire the ashes would have been of more value than the whole straw: were they right, and what is the manurial value of straw? 2. Is there much difference in the draft of plows, and if so, how much, and how can the difference be ascertained?

ANS.—1. A part of anything cannot be equal to the whole, so the ashes of your straw cannot be equal to the whole straw. In the ashes, if none had been lost by blowing away, there would have been only the potash, phosphoric acid and other mineral elements; the nitrogen as well as the carbon would have been driven off; while by applying the straw and plowing in you will retain all these in the soil, and, besides this, the rotting straw will have a beneficial effect mechanically, and especially so if the soil is at all clayey. It may be true that the ashes will have a more immediate effect and may show better results on the crop this Fall, and possibly on the first crop; but in the end we are quite sure the plowing in was the wiser course. Had you fitted the land, sowed the crop and after that applied the straw broadcast and thinly on the surface, it would have been better yet. It would then have acted as a mulch in protecting against the injurious effects of Winter, would have also aided in conserving moisture during next Summer's drought, and, as it rotted, would have given the soil all its fertilizing elements. We have always found this the most desirable method of using straw next to using it in the stables. A ton of wheat straw contains, according to Wolff's tables, about 92.2 pounds of ashes, of which about 12.6 pounds are potash, 4.4 pounds phosphoric acid and 5.4 pounds lime. Besides these elements of plant food, there are about 9.6 pounds of nitrogen, so that if we give the valuations adopted by the stations, the manurial value would be about $2.67, to say nothing of any component aside from its nitrogen, phosphoric acid and potash. But every farmer should remember that a ton of straw also contains 47 pounds of protein, 36 pounds of fat and over 800 pounds of carbohydrates, and that by a proper system of feeding this, in connection with foods rich in protein or nitrogenous matter, such as clover hay, bran and oil meal, and also with some succulent food, a good profit can be made, and nearly all of its plant food will be left in the manure as well as that of the other foods added, so that doubtless the best use to make of straw is to feed it and give the resulting manure to the land. 2. There is considerable difference in the power required to draw the various forms of plows. This depends upon the shape of the mold-boards, and the hardness of the material of which they are made and also, to some extent, on how much of the weight of the plow, the pressure in turning, is carried upon the wheels. As a rule, those plows which most break up and pulverize the furrow slice on its passage from its original position to its final reversal, will draw harder than those which turn without much disturbance; but this difference is more than made up by the quicker and easier fitting of the land after plowing, so that the easiest-drawing plow is not always the most desirable. The difference can only be ascertained with accuracy by the use of an instrument called a dynamometer. This has a heavy spring with graduated dials and index, and is sold by dealers in mathematical and engineering instruments.

AN ICE-HOUSE.

G. M. C., Caldwell, N. J.—In building an ice-house, how wide should the air-space be? How should the roof be made? In a properly constructed building is any covering needed over the ice?

ANS.—In answer to the above inquiries here is a description of an entirely successful ice-house. The building is 14x22 feet, studding 18 feet, two by eight-inch stuff. On each side of the studding paper is nailed, then a thickness of matched flooring, another thickness of paper and again matched flooring. So there are four thicknesses of paper and four of boards between the ice and the outside. The roof is nearly flat and tinned on matched boards. The joists are put on the studs two feet below the roof, and there is a ceiling of inch boards beneath the joists. The space between the ceiling and roof is filled with sawdust. There is a cold-storage room between the body of ice and the floor. To sustain the great weight, two beams well studded beneath them, run lengthwise of the house, and cross joists on these are placed about 18 inches apart. The beams slant enough to give pitch to the floor on which the ice rests—the floor being made of galvanized iron well soldered, so that it does not leak. Above the iron are inch boards on which the cakes of ice rest, and covering about each alternate six inches of the floor, the theory being to have only enough of the iron covered to protect it from being bruised by the ice, leaving as much as it is possible with only the thickness of the iron between the ice and the air of the room beneath it. The floor of the cold store room is double and made air-tight. The room is 6½ feet between the joists and floor. When the door of the cold store room is closed the temperature of the room is at 36 degrees Fahrenheit. If such a cold store is the sole object, then if the door of the ice-house is not opened all Summer, the ice needs no covering of saw-dust. If, on the other hand, it is necessary to occasionally open the doors to take out ice for family use or for butter-making purposes, then a covering a foot deep of sawdust or fine shavings should be put on, or the ice will waste fast. The air of such a cold store-room is dry; so free from moisture that a match can be lighted by scratching it against the walls. Fresh meat kept well in it three weeks, last August. If no cold store-room is wanted, the floor should be slanted and made as strong as above—for there must be a drain from the ice and the floor must be strong, so that no movement of it takes place. A word of caution here in regard to having solid ice: we know of a partial failure in such an ice-house because it was thought that as no ice was wanted to use direct, a porous quality of ice would do as well. But it did not, as the house was empty early in September, when one with pure, solid ice lasted till Winter came again.

FEEDING VALUES OF LINSEED AND COTTON-SEED MEAL AND RYE AND WHEAT BRAN.

J. B. W., Round Lake, N. Y.—1. What are the feeding and manurial values of linseed-oil meal? 2. What is the same of cotton-seed meal? 3. Is rye bran as good as wheat bran as a feed for milch cows?

ANS.—1. Taking the average analysis as given by Prof. Jenkins, and figuring the feeding value of protein, fat and the carbohydrates the same as used by the Germans, would give the feeding value of new-process oil meal at about $35 per ton. And supposing that four-fifths of the potash, phosphates and nitrogen is left by the animal in the manure (and more than this proportion is actually voided in the solid and liquid excrements), and these be returned to the fields, and that we estimate them as worth no more than the same amount of each would cost if purchased in any commercial manure, the manurial value of a ton would be $21.88. This meal can now be bought at the factories at about $21 per ton by the car-load in bulk. 2. Cotton-seed meal, figured on the same basis, would be worth for feeding purposes about $30 per ton, and its manurial value would be about $25 per ton. These figures would seem to indicate that cotton-seed meal would be much the more desirable food to purchase, but it must not be forgotten that while the new-process oil meal contains only about two per cent. or less of free oils, the cotton-seed meal contains nearly 13 per cent., and that this is given in the feeding tables as equal to 32 per cent. of carbohydrates. These values are estimated chemically, and in practice are found to be very erroneous, especially so when these products are fed in large quantities, because no animal can eat and digest so large a quantity of free oil, and this large percentage is actually injurious. Besides this, there is in the cotton-seed meal a principle that in many cases has produced injurious effects upon the animals which are fed largely on it. These by-products of the great oil industries of this country are both very valuable, both as food furnishers and as giving to the resulting manure a very high value, and both of them should be entirely consumed by American farmers instead of being largely exported, as is the case at present. But we must advise farmers of the North to be very careful in feeding cotton-seed meal until the animals have become accustomed to its use, and even at a higher relative price new-process linseed meal is preferable, because safer, and it can be fed in larger quantities, and this is especially desirable in order to make all the manure possible where the salable products, such as butter, wool or milk, will buy and pay for the food. 3. Rye bran contains in every 100 pounds of protein, or milk, muscle and blood-forming elements, 13.4 pounds; of carbohydrates, or butter, fat and heat-forming elements, 73 pounds, including the fat when reduced to its equivalent in these, so that it is worth, on the same basis as the above, $1.18 per hundred pounds for feeding, and the resulting manure contains plant food worth 53 cents. One hundred pounds of wheat bran contains of protein 16.5 pounds, of the carbohydrates, including the value of the free fat, 71 pounds, and these are worth for feeding $1.30. The resulting manure contains 76 cents' worth of plant food, so that we see that the wheat bran is worth for both purposes 35 cents per 100 pounds the most. But as the nutritive ration of the wheat bran is as 1:43, or one of protein to four and three-tenths of carbohydrates, while the rye bran is as 1:6, nearly, for milk production, the wheat bran has a still greater value.

THRUSH OR "FOOT-EVIL" IN A HORSE.

D. A. D., Collinsburg, La.—What is the cause of foot-evil in a horse, and is there any way to prevent the hoof from coming off?

ANS.—By "foot-evil" we suppose you refer to the inflammation of, and fœtid discharge from the secreting membrane of the frog, a disease better known as *thrush*, but occasionally miscalled "foot-evil." This disease usually begins in the cleft of the frog and may extend to the whole organ if not checked. The most common cause of thrush is filth and moisture, as standing in any wet, dirty stable, or yard, on dung and urine, or running in a low very wet pasture. More commonly the disease appears only in the hind feet from standing in the collected dung and urine of filthy stables; but animals in loose boxes, yards, or fields may have any foot affected. Dried mud or gravel in the cleft of the frog causes irritation and inflammation; also injuries to the frog, and excessive paring which renders the frog especially liable to bruises. Finally, anything that causes contraction of the heels causes undue pressure on the parts within, in this respect acting as slight continued bruises which cause inflammation, soon to be followed by the characteristic discharge. Like most other diseases, some animals are much more susceptible than others, while occasionally a horse appears to be almost predisposed to the disease. The hoof can readily be prevented from coming off by treating the disease in the earlier stage, and thus arresting its growth before it has proceeded so far as to cause sloughing of the hoof. The treatment is very simple, and a thrush can usually be readily cured by cleanliness and the local application of calomel or other dry caustic. Carefully clean the foot and pare away all detached diseased pieces of horn or frog. The caustic is then best applied by being placed upon pledgets of tow or lint and pressed in upon the diseased tissues. After the discharges cease dress with the best pine tar until perfectly healed. During, and after, treatment the animal must be kept where the feet will be *clean* and *dry*. If the stable is such that the horse must stand in his droppings, a leather boot should be worn during treatment when in the stable and removed when the animal is taken out. A clean, dry pasture is an excellent place for a speedy recovery.

DISTEMPER IN A HORSE.

C. W. W. (Address mislaid).—What is "distemper" in a horse, and how can a stable in which an affected animal stood be so disinfected that young colts will not catch the disease there.

ANSWERED BY F. L. KILBORNE.

"Distemper" is an indefinite general term popularly used to designate either influenza or strangles, more commonly the former, or occasionally simple catarrh or other nasal discharges. A very effective method, which is at once cheap, safe and of easy application, for the disinfection of such buildings is to remove all stock, close the doors and windows so as to make the place as tight as possible and burn a sufficient quantity of sulphur to fill the whole building with sulphur fumes. Leave the building closed for 24 hours. In addition to the above, all wood-work and utensils that have been in immediate contact with the diseased animals should be thoroughly cleaned and may be washed with boiling water, a solution of chloride of lime, or a two-per-cent. solution of sulphuric acid. Solutions of chloride of zinc, sulphate of copper and other disinfectants are equally effective, but more expensive while-washing with freshly slaked quick lime is also an excellent, cheap disinfectant and deodorizer, and may be profitably used where there is no objection to the white color left by the white-wash. After such disinfection, if the work is thoroughly performed, the colts may safely be admitted to the stable. But strangles and especially in-

fluenza is so readily contracted during an outbreak of the disease, that if the colts should have either disease after entering the stable, it would not necessarily follow that they received the disease from the building. They might easily contract the disease from other unavoidable sources even if all possible precautions were taken to prevent it. Fortunately either disease with simple treatment and proper care—and more depends upon the care than upon the medicinal treatment—usually runs a favorable course, and is not to be especially dreaded.

LOWEST COST OF MILK.

A. J. H., Dryden, N. Y.—What is the lowest price at which milk can be sold and a profit made in making it?

ANS.—So much depends upon the individual animal used and the conditions under which she is kept that it is very difficult to give a correct answer. Many experiments have been made in which the cost has ranged from three-fourths of a cent to 2¼ cents per quart. A very careful test was made by Professor Roberts at Cornell University in March, 1884, on three cows in which the milk cost 1½ cent per quart. In this the food consumed by the three cows consisted of 41 pounds of clover hay, 14 pounds of corn-stalks, 15 pounds of cotton-seed meal, 14 pounds of corn meal and 14 pounds of malt sprouts, and the prices were given as $8 for the hay, $4 for corn-stalks, $26 for meal and $14 for the malt sprouts, which were at least extreme market rates, and no allowance was made for the value of the manure. We think that with an addition of some green food to this ration and a proper allowance for the value of the manure which was made, and which Professor Roberts shows to have been worth at least 50 cents per day after deducting 20 per cent. of manurial elements as the amount retained in its passage through the cows, that the actual cost of the milk would have been reduced below three-fourths of a cent per pound. Of course, to do this liberal feeding must be adopted for the reason that the milk is a surplus product, and no matter how meagrely the cow is fed she must first retain from the food sufficient to maintain her flesh and keep it warm.

DROPSICAL SWELLING IN MARE'S LEG.

H. W., Minaville, N. Y.—The left hind leg of a mare swells from the knee down—most in the ankle joint. The swelling disappears when she is worked or driven, but reappears when she stands for a few days. There is some swelling also under the stomach, especially near the teats. She had "scratches" first about a year ago; but the swelling has stuck to her since; otherwise she appears in good health; what should be done for her?

ANS.—The swellings appear to be essentially anasarcous or dropsical, probably due to unhealthy dietetic conditions. Look over the feed, care and stable to make sure that each is as it should be. Faults in either may be the cause of the difficulty. Give daily exercise—a short drive or a run in a yard—when not at work, and stable in a loose box if convenient. Night and morning give one ounce each Epsom salts and powdered gentian and two drams each niter and chlorite of potash. If the bowels are constipated or irregular add one dram Barbadoes aloes until relieved. Report condition after one month.

Miscellaneous.

J. H. W., Providence, R. I.—Our carriage-horse is troubled with an eruption mostly on the neck and fore-shoulder. It is in the shape of small bunches and is very annoying to him, as he rubs and bites the places through the blanket most of the time. When curried white scales come off. The trouble began two months ago, but is now increasing. The animal is otherwise well; what is the matter?

ANS.—The difficulty may be due to disease of the skin, caused by faulty nutrition, or to lack of grooming and proper care. Have the animal groomed thoroughly for an hour daily, and also give a short drive or run in a yard. Twice daily give one-half ounce each powdered gentian, ginger and sodium carbonate, with one dram aloes. Drop the aloes if the bowels become too loose.

A. K. F., Chicago, Nebraska.—Which is the best way to protect grape-vines during the Winter in Northern Nebraska?

ANS.—In Northern Nebraska grapes only require protection from sun and wind during Winters. For this purpose they may be laid upon the ground and covered with any coarse litter, such as grass, straw or corn-stalks. If danger is apprehended from field mice, the better way may be to cover lightly with earth. This, however, is to be avoided unless the soil is light and consequently not likely to hold an excess of moisture, which would be liable to injure the buds.

A. L. L., Horse Shoe Bend, Idaho—What sort of a plum is Kelsey's Japan? We have a plum here which bears heavily a yellow prune-shaped fruit, which is a good keeper, often lasting till Christmas, shrinking only a little. The pits are quite free; the tree is a very moderate grower. From this description can the RURAL tell the variety?

ANS.—No; from this description we can not name the plum. We are inclined to think that Kelsey's Japan is a first-rate acquisition. Still, we do not speak from experience. For illustration and history see the R. N.-Y. of Nov. 20, last.

H. E. A., Alton, Ill.—Rugby is a town in Morgan County, Northeastern Tennessee among the Cumberland Mountains, about 100 miles north of Chatanooga. It was founded as an English colony over a dozen years ago by Thomas Hughes, author of "Tom Brown at Rugby," a celebrated novel, and other works, and was called after the market town of Rugby, Warwickshire, England, the site of the celebrated grammar school over which the famous Dr. Arnold presided. The colony has been several times on the point of failing; but it is still in existence, and by last accounts was doing pretty well.

B. W. O., Wakefield, Mass.—Where can the Sanitas Disinfectant and other products of Sanitas be obtained?

ANS.—Of the Sanitas Co., 636 West 55th Street, New York, or of local druggist.

A. M. S., Easton, N. Y.—The little book recently noticed in the RURAL entitled "The Making of Pictures," will give one a fair idea of art. It is published by the Inter-State Publishing Co., Boston, Mass.

H. W. C., Bradford Co., Pa.—Who is a reliable honey dealer?

ANS.—S. H. and E. H. Frost, 100 Park Place, New York.

Subscriber.—The fare from New York to San Francisco by sea is $80 for first-class and $60 for steerage.

F. D. S., Ithaca, N. Y.—What is the rating of A. J. Holman & Co., publishers of bibles, Philadelphia, Pa?

ANS.—We offer their bibles as premiums to our agents and believe the firm to be altogether trustworthy, as well as reasonable in their prices.

DISCUSSION.

BOARDING FARM HANDS.

J. B., NEWMARKET, Ont., Canada.—I was surprised and vexed to see the conclusion of Prof. E. M. Shelton's letter on Farm Economy, in the Thanksgiving issue of the RURAL, where he says: "The house of the farmer who boards his own help can never be a model farm home. I think of no spectacle in connection with the farm quite as unlovely and degrading to all concerned as that presented by the farmer's wife and daughters whose lives are largely given over to the abject drudgery of cooking and washing and bed-making for hired men."

I was vexed because it shows a tendency to widen instead of narrowing the gap between the upper and the lower classes, between the employer and the employed. In most, if not all, new countries everybody, so long as he proves himself honest and respectable, is as good as his neighbor. In England there is a wide gap between the employer and the working-man; now is this condition of society a healthy state of things? Did God ever intend it to be so? Is it right? Is it acting the part of a Christian for a man not to associate with another man because he works on a farm, or because he wears corduroy pants, or because he is not ashamed to carry a pail of milk or a bushel of eggs through the streets? I believe that all honest work is honorable. Then I ask why, so long as a man conducts himself in an honest and respectable manner, is it more "unlovely and degrading" for farmers' wives and daughters to cook and wash for him than for the other members of the family, or for occasional visitors? I am an Englishman, but have worked two years in Canada, and I believe that laborers here are generally superior to those of the Old Country, because the men are treated on an equality both by the farmer and his wife. It is only natural when a farmer is kind to his man, that the latter should do his best for his master. Again, is it not wiser and more economical to board the farm hands? If anything goes wrong, for instance if anything should happen to the horses or cattle either early in the morning or late at night, the men are close at hand and ready to help. Is it not cheaper to pay $150 and board a man for a year, than to pay $280 and let him board himself, or pay for board elsewhere, especially as the farmer has the great advantage of having most of his provisions at first cost—the cost of production.

Miscellaneous Advertising.

"SINGER" MODEL SEWING MACHINES for $12.00 up. Warranted 5 years. New and perfect. Sent on trial if desired. Organs given as premiums. Send for circular with 7,000 testimonials from every state. We can save you $15 to $50. GEO. PAYNE & CO., 42 W. Monroe St., Chicago.

PETERSON'S MAGAZINE.

EVERY LADY SHOULD TAKE IT.

JANUARY NUMBER NOW READY.

PETERSON'S MAGAZINE is the **best and cheapest** of the Lady's books. It gives more for the money, and combines greater merits than any other. It gives

THE BEST STEEL ENGRAVINGS,
BEST COLORED FASHIONS,
BEST ORIGINAL STORIES,
BEST and LATEST DRESS PATTERNS,
BEST WORK-TABLE PATTERNS,
BEST COOK-BOOK, MUSIC, Etc.

Its immense circulation and long-established reputation enable its proprietor to distance all competition. Its stories, novels, etc., are the best published.

MAMMOTH COLORED FASHIONS!

"PETERSON" is the only magazine that gives those. They are TWICE THE USUAL SIZE, unequaled for beauty, the latest Paris styles, steel plates, colored by hand.

TERMS (always in advance), $2 A YEAR.

Unparalleled OFFERS to CLUBS.

2 Copies for $3.50 } With the "Book of Beauty," a splendidly illustrated gift book, as a premium for getting up the club.
3 " " 4.50
4 Copies for 6 40 } With an extra copy of the Magazine for 1887 as a premium for getting up the club.
6 " " 9.00

FOR LARGER CLUBS STILL GREATER INDUCEMENTS.

Address, post-paid,

CHARLES J. PETERSON,
306 Chestnut Street, Philadelphia, Pa.

Specimens sent gratis, if written for in good faith.

"*The Model Newspaper of New England.*" —Boston Commonwealth.

SPRINGFIELD REPUBLICAN FOR 1887.

The REPUBLICAN aims to be a newspaper in the broadest and highest sense. It prints all the legitimate news of the day without fear or favor, unembarrassed by personal or partisan obligations, and in compact, well arranged form. Its facilities for gathering and publishing the news are unsurpassed outside of the largest cities, and are constantly improving.

THE REPUBLICAN is distinctively a New England newspaper, although its reputation is national. It faithfully reports the life of this region and represents its intelligent spirit.

In its political attitude THE REPUBLICAN maintains a thorough independence, giving a fair hearing to all reasonable men and parties in its columns, but asserting its own convictions on public issues with vigor and clearness. It is opposed to unjust monopoly in every form, to oppressive and unnecessary taxation, to any misuse of public trusts. It favors tariff reform in the interest especially of the poor man, civil service reform in the broadest measure, suspension of silver coinage and the acceptance of the commercial world's money standard, and the promotion of American interests by natural and sound methods.

THE REPUBLICAN is an earnest advocate of temperance, of social simplicity and purity, and of all the good causes that help to make life better.

It is not merely a journal of news, but undertakes to instruct and entertain its readers by the publication of a rich variety of literary and miscellaneous matter, embracing home and foreign correspondence, stories, poetry, book reviews and notices, religious selections and discussions, special articles and compilations for the farmer and mechanic, for women and children, dramatic, art and society notes etc.

A new and valuable feature of THE REPUBLICAN is its

SERIES OF WAR MEMORIES,

Being interesting reminiscences of the rebellion written expressly for its columns, chiefly by Western Massachusetts veterans, both officers and privates. These articles appear in Monday's Daily and in THE WEEKLY REPUBLICAN each week.

THE DAILY REPUBLICAN

Is $3 a year, $2 a quarter, 70 cents a month, 18 cents a week, 3 cents a copy.

THE SUNDAY REPUBLICAN

Is $2 a year, 50 cents a quarter, 5 cents a copy.

NOTICE.

ALL subscribers who desire the RURAL's Seed Distribution must APPLY for it. Hitherto we have not required those who subscribe for the RURAL in connection with other papers to make an application. This has caused confusion. It is only necessary to say "SEND SEEDS."

AND so we are blessed with the opportunity of once more wishing our readers a Merry Christmas. And we wish it right heartily.

AND again the year is nearing its close. How the years roll by! Many, very many of our readers are growing old. And the RURAL is growing old too, and its editors along with it. But we hope to live another year and to give our best efforts to the RURAL, and again next year, as now, to wish our friends a Merry, Merry Christmas!

THE next number of the R.N.-Y. (Dec. 25) will be the Index Number, the last of the year. The average index of weekly papers is of little value to anybody. The reason is probably that a carefully prepared index involves not only an immense amount of patient labor, but it must be prepared by those who are skilled in the work. The real value of a comprehensive, accurate index to a farm journal is known only to those progressive farmers who are liable at any time to desire specific information on any of the important farm questions which may arise and which need immediate answers.

IT still seems to be an open question whether it is more profitable to grow a single ear or two ears or more of corn to a stalk. It is a question that ought to be easily answered. If the single ear gives a greater weight of grain than two or more ears it is unquestionably the best corn to raise. If it gives the *same* amount of grain, it is still the best corn to grow, for it takes about twice as much time to husk and shell two ears as it does one. For 10 years we have raised both the so-called Blount's Prolific and the Chester County Mammoth. The former will average over two ears to a stalk; the latter less than one ear. And yet the average yield of the Chester in shelled corn is, year after year, greater than the other.

THERE is an immense field for the improvement of nuts by crossing. Thus the Japan and American chestnuts could very readily be crossed, the male and female flowers being distinct on the same plant (monœcious) as in Cupuliferæ, or the Oak Family in general. It would only be necessary to shake the ripe male flowers (catkins) of the one over the little cone-like females of the others, and then cover them with light, strong paper for a few days. It would be just as easy as to cross different varieties of corn. We should have attempted the cross last Summer, except that our only specimen of Japan Chestnut bore only sterile flowers. Of course, in order to originate the best crossbreeds it would be judicious to select the best of the Japan and American chestnuts for parents. This the RURAL can not do, as we have not discovered any superior American Chestnuts about us, and our Japan seedlings are as yet too young to bear. But some of our nurserymen or readers may act upon the suggestion.

THE Hon. A. H. Parker, of New York, has introduced a bill into Congress to increase the tax on oleomargarine from two to six cents per pound, and also wishes to strike out from the present enactment the words, "and all oleomargarine intended for future consumption which contains ingredients adjudged * * * to be deleterious to public health shall be forfeited to the United States." Dairymen are constantly complaining that the present tax is insufficient, and that the above clause in the bill lately passed gives an unfair advantage to the dealers in oleo, since it intimates that the government stamp is evidence that there are no deleterious ingredients in the concoction; whereas, as a matter of fact, the government officials have neither the knowledge, time, nor facilities for examining the fats used at the various factories. It might have been better to wait a little longer before seeking any amendments to the present law, so as to allow time enough to learn more thoroughly its faults and shortcomings, and the defects in its enforcement. The oleo men, however, were preparing to strike; and it may be as well that the dairymen have got in the first blow.

THE following articles will appear early in the New Year:

MANURE *versus* DROUGHT.
By Dr. W. I. Chamberlain. President of the Iowa Ag. College.

BEAUTIFUL TREES AND SHRUBS NOT WELL KNOWN AT THE WEST.
By Prof. J. L. Budd, of the Iowa Agricultural College.

EXPERIENCE IN CORN GROWING.
By Prof. G. E. Morrow, of the University of Illinois.

LAWES & GILBERT'S EXPERIMENTS.
By Joseph Harris, of Rochester, N. Y. These articles will continue through the entire year.

THE OUTLOOK FOR STRAWBERRY CULTURE.
By President Parker Earle, of Ills.

ROSE CULTURE IN THE SOUTHERN STATES.
By President P. J. Berckmans, of Georgia.

SORGHUM HALAPENSE AND ITS MANY ALIASES.
By Hon. Henry W. Ravenel, of South Carolina.

MORE QUITE EARLY AND LATE PEARS.
By Gen. W. H. Noble, of Connecticut.

THE FARM LABOR PROBLEM.
By Prof. F. A. Gulley, of the Mississippi Agricultural College.

TOBACCO RAISING IN NORTH CAROLINA.
By M. B. Prince.

NOTES FROM ROTHAMSTED.

THE ABOLITION OF THE WASHINGTON SEED DISTRIBUTION.
By the R. N.-Y. and several contributors.

THE WASHINGTON SEED ABOMINATION.

WE propose to do all in our power during 1887 to create a feeling inimical to the continuance of the Washington Seed Abomination. It is assumed that the money which it costs—let us say one hundred and fifty thousand dollars yearly—is appropriated and spent for the benefit of farmers and the promotion of the agricultural interests of the country. We have never heard of or talked to an intelligent farmer who did not regard it as an injudicious expenditure, or else simply as a politician's device to further his own selfish ends.

Who pays this money? Every tax payer. But those who do *not* cultivate land can receive no benefit; while, if those who do cultivate land regard is as a profligate waste of money, there seems no reason why this appropriation should continue, or, if continued, why it should not be used for the *benefit* of farmers in one way or another.

One hundred and fifty thousand dollars would amply support a Central National Experiment Station for three years, if good and efficient officers were appointed to conduct it, and from such a station we might hope for adequate results if the farmers of the country were permitted to select the officers. But anything of this kind if made a political machine, will grind out its scanty products at a cost far beyond their value. There are many Congressmen who know full well that this seed business is little short of an absolute swindle upon the people. There are many other Congressman who favor it solely as a method of gaining popularity or votes, and it is these alone who are responsible for the maintenance of the Washington Seed Store. But the farmers can change this if they will, and it shall be our endeavor to bring about this change.

We are by no means opposed to the appropriation of one hundred and fifty thousand dollars or of twice that amount for the promotion of farm interests; but we don't want the farmers to get the name and the politicians to get the game. Now, readers of the RURAL and brethren of the farm press, let us heartily unite and see what we can do.

PRIZES FROM THE RURAL'S SEEDS.

A CLOSE CONTEST.

THE PRIZES WIDELY DISTRIBUTED.

Manitoba Secures the Corn Prize; *Iowa has the Heaviest Peas*; *Kansas the Heaviest Watermelon*; *Arizona the Heaviest Cantaloupe.*

ANGEL OF MIDNIGHT CORN.

THIS contest was exceeding close and very hard to decide. The prize was offered for "the longest ear containing the greatest number of kernels." Our idea was to select the ear producing the greatest weight of grain. The best ears varied greatly: one report was sent of an ear 15¾ inches long, containing 385 kernels. Another was 10 inches long and contained 627 kernels. Obviously the kernels in one case were much larger than in the other, while the weight would be about the same. After carefully comparing all records, we award the prize to

E. FOWLER, HEADINGLY, MANITOBA.

The prize ear contains 548 kernels and is 13 inches long. In our judgment the next best ear was that grown by Rev. L. S. Ely, Mitchell Co., Iowa. This was 13 inches long and contained 537 kernels.

ALASKA PEAS.

The weights varied very widely, owing doubtless to the fact that the peas were weighed at different stages of maturity: some while green and others when fully ripe. To the best of our judgment the prize should be awarded to

ROBERT E. CRYLIE, CARROL COUNTY, IOWA.

The 10 pods secured by him weighed 4¼ ounces. Several reports of heavier peas were sent to us, but weighed upon our own scales they fell far short of the reported weight. The next heaviest peas were grown by W. H. Taylor, Canada.

BIRD CANTALOUPE.

The heaviest cantaloupe of which we have record was raised by

W. A. LATTIN, PINAL CO., ARIZONA.

This weighed 29 pounds. The next largest was grown by B. M. Bixler, Buffalo Co., Nebraska. This weighed 20 pounds.

WATERMELON.

The heaviest melon was grown by

A. M. PYLE, EDWARDS CO., KANS.

It weighed 50½ pounds and measured 34 and 54 inches in circumference. The next heaviest melon was grown by J. M. Moss, Clay Co., Fla. This weighed 50 pounds.

The prizes, $10 each, will be forwarded to the winners. The contest drew out an unusually large number of competitors. Many boys and girls won honorable places on the list. The RURAL returns thanks to its friends for their interest in the matter. We wish all could obtain a prize.

PLEURO-PNEUMONIA MUST BE ERADICATED.

IN a late communication to the President the Western cattlemen say they "have more than $600,000,000 invested in cattle alone," and that their vast herds will in all probability be swept from the earth if contagious pleuro-pneumonia once reaches the open ranges. Vast as are the cattle interests of the rangemen, however, they are small in comparison with those of the rest of the country, which are also endangered. A recent investigation into the losses from this plague among cattle in Illinois has resulted in a report which says that "the Hereford interest in the State has suffered to the value of $1,000,000"; while the annual loss to the cattle interests of the State are placed at $10,000,000. Add to this loss in Illinois alone those in the rest of the country, and the yearly losses incurred by the cattle owners of the nation, owing to the presence of this disease among us, will reach an appalling magnitude. Commissioner Colman well says "with a disease of this character at Chicago" the cattle industry "has reached a crisis"; for that is the most dangerous point in the whole country for its speedy distribution to the pastures and ranges of the entire West. Before the disease appeared here tens of thousands of cattle were shipped to England to be taken to the interior to be fattened on American corn and feed-stuffs and sold in the markets as American cattle. The cattle shipped to that country now have to be slaughtered on the docks, which decreases the price of shipping cattle $15 per head. The Consolidated Cattle-growers' Association of the United States demands of Congress a rigid inspection system and an appropriation of $5,000,000 to enforce it. The President, in his message, recommends prompt action in this line. With an overflowing Treasury and absolute control over transportation between the States and the importation of cattle from abroad, the responsibility rests on Congress to take immediate action on these demands. The question concerns the consumers of beef, milk, butter and cheese, as well as the cattlemen of the country, for the losses which will certainly follow inaction or negligence at Washington will greatly increase the prices of these products. One of the first bills passed at this session of Congress should provide for the eradication of the plague, and it should grant full power and money to effect that object.

BREVITIES.

THE new "Jessie" is said to be the most remarkable strawberry of latter days. Let us see.

THE Eye-Opener and farm-law items will be found this week on page 850. The Youth's Department is unavoidably omitted.

WE find that Washington Territory is not going to be behind other parts of the country in propagating the Japan Chestnut. We find them offered for sale in a catalogue just received.

THE important and well-considered address of Pres. Lyon before the Michigan State Horticultural Society will be found in the Grand Rapids Democrat of Dec. 1st, 2nd and 3rd, as well as a full report of the proceedings.

WE should like to see a Central National Agricultural Experiment Station established—say in Missouri—and in the middle of the grounds a "colossal statue of a farmer supplying the world" designed after our first-page engraving.

EARLY in January we shall place before our readers, in a supplement, a full account of the results of last season's trials of all kinds of fertilizers upon potatoes. This experiment is a repetition of that made two years ago, though more extended. The two will be compared together and so illustrated that all may understand the more important results without much study.

SCORES, if not hundreds, of new grapes have been introduced during the past 10 years, all of which, it has been claimed, were superior to the well-known kinds. To-day (Dec. 6) not one of these newer grapes can be found in our large markets. Of all our native grapes, the Catawba is the only one to be found in quantity. It must be considered, however, that many years are required so to distribute and to propagate a new grape that it can be offered for sale in large quantities.

WE were taken to task awhile ago for stating that the Niagara Grape sold for a fancy price in a Broadway fancy fruit store. "Such statements are misleading," our friend said. The grapes referred to were evidently selected bunches grown in bags, and so we remarked at the time. We have said over and over again, and were the *first* to say in print, that the quality of the Niagara is no better than that of the Concord in our humble estimation. If beautiful bunches, grown in bags, sell for a fancy price, is there any harm in stating it as an item of news?

THE R. N.-Y. some time ago expressed surprise and doubt as to the statement made by one of our leading small-fruit nurserymen that the Earhart Everbearing and old Ohio Everbearing were the same. Mr. L. H. Girton, of Bristol, Ind, writes that he has them both growing side by side, and that they differ widely in manner of growth, leaf and stalk. "In fact," he says, "the Earhart is different from anything of the raspberry kind I know of." Mr. John Little, of Ontario Canada, writes that he has both kinds and that they "bear no resemblance to each other whatever."

AN experiment begun about eight years ago ended the past Summer. A strong root of Paulownia imperialis was planted in the Spring and confined to a single shoot. It grew the first season about six feet high. The next Spring this growth of a single stem was cut off at the ground. All but one bud was rubbed off and a stem 10 feet high grew that second season. The third year this was cut off and the new stem grew about nine feet. Since then the new stems have made less and less growth until the past Summer, when the plant died. The fact is that *all* pruning tends to weaken plants and that severe pruning, if long continued is death.

IT is said that in China two species of ants which build their nests suspended from the branches of trees, are protected by orange growers who stretch rods from tree top to tree top to serve as bridges for the ants which keep the trees clear of injurious vermin. Some species of ants have been found to be effectual destroyers of canker-worms in this country. In Italy and Germany colonies of the common black ant are established in orchards by the care of the proprietors as a sure means of keeping the trees clean. Here we are very unjust and thankless to ants, worms, toads hornets and even snakes.

LAST Summer the first of our blackberries to ripen, as we have stated, was the Early Harvest. The date was July 10; the quality rich and good. The plants are rather tender. The second to ripen was the Snyder, viz., July 20. Taylor's Prolific ripens after Kittatinny. The thorns of this variety are formidable. Wilson Jr. ripened *with* Kittatinny, though claimed to be much earlier. Early cluster ripens about with Snyder, a trifle earlier than Kittatinny, but the berries are smaller and the quality certainly no better. What we want is a thornless blackberry of the quality and size of the Kittatinny and of the hardiness of Snyder. No doubt we shall have it some day.

Biographical.

GENERAL WILLIAM H. NOBLE.

GENERAL WILLIAM H. NOBLE, a likeness of whom is given at Fig. 460, was born August 18th, 1813. His parents—the Rev. B. G. Noble and Charlotte (Sanford) Noble—were respectively of New Milford and Newtown, Conn. His father was Rector of Christ Church, Middletown, Conn., and with him he lived until the age of 15. From the age of 11 to 15 he attended Captain Partridge's Military Academy at Middletown, and celebrated, with 200 of its students, under arms at New York, the fiftieth anniversary of the Declaration of Independence. In the Fall of 1828, at the age of 15, he entered Trinity—then Washington College—at Hartford, Conn., and in the Spring of 1830, entered the Sophomore Class of Yale. He graduated from Yale with honors, August, 1832, at the age of just 19 years; taught for a year and a half a private academy at Stamford, Conn., and began, in the Spring of 1834, at Bridgeport, Conn., the study of the law. He was admitted to the bar of Fairfield County in the Spring of 1836. The same year he aided in procuring the charter of the Housatonic R. R. Co., the second railroad in Connecticut, and became its secretary, and was for many years active in its organization and construction. The same year he procured the charter of the City of Bridgeport, and was Clerk of the Courts of Fairfield Co., Conn., and States Attorney for that county for a number of years.

From 1836 down he was active in promoting the growth of East Bridgeport by building bridges and other connections, and in 1850, having purchased of his father's estate and others about 70 acres, he mapped out that portion of the city, and connected it by a short foot-bridge with the center of Bridgeport.

In 1851, P. T. Barnum, the great showman, purchased of him one-half his interest in this property, and they went on purchasing together until their area covered over 200 acres, on which were worked streets and avenues and a public park of native woodland, and they connected the same by a new and more direct carriage bridge with the center of the city. Thus was laid the foundation of that which will soon be the second city in Connecticut. In 1850 General Noble was nominated for Congress from the Fourth Congressional District of Connecticut; but his large majority in Fairfield County, where he resided, was overcome by the adverse vote of Litchfield County.

In 1861 he took a very active part in the organization of the Union Party in Connecticut, and in the nomination and election of Governor Buckingham. In July, 1862, he was commissioned by this Governor Colonel of the 17th Regiment of Connecticut Volunteers, the Fairfield County Regiment. Their camp was formed on what is now the Seaside Park of Bridgeport, and inside 30 days he had over 1,000 men ready for the front. Sept. 3d, 1862, they left for the field destined for Siegel's 11th Corps. Their first battle was that of Chancellorsville, at which Col. Noble was severely wounded and where his regiment—as stated in Greeley's "American Conflict"—"bore a resolute part and had its Lieutenant-Colonel killed." From this wound Col. Noble barely recovered in time to reach Gettysburg on the light of the last day, in which battle the regiment was severely handled and lost another Lieutenant-Colonel and many of its men—a monument to whose memory stands on Barlow's Knoll on that great battle-field.

Col. Noble's regiment was then sent to Folly Island, S. C., to take part in the siege of Forts Wagner and Sumter. After the fall of these forts the regiment was sent to Florida, where he finished his active service in command of the territory east of the St. John's River, with headquarters at St. Augustine. While holding this command he was captured by the enemy and confined for a time in the Andersonville Confederate Prison; on his release from which he was brevetted Brigadier-General by General Grant's recommendation, and mustered out of the service with his regiment, July 19th, 1865, at the close of the war. Among the well-known men who served in the ranks of this regiment were Elias Howe, Jr., the inventor of the sewing machine; Anthony Comstock, Esq., President of the Society for the Prevention of Vice in New York City, and Hon. Phineas C. Lounsbury, Governor-elect of Connecticut.

Since his service Gen. Noble has returned to the practice of law, and interested himself, as before, in horticultural and agricultural pursuits. He has been Alderman or Common Councilman of the City of Bridgeport, chairman of its Board of Park Commissioners for several years, and a member of the Legislature of Connecticut, retaining his active interest in public affairs, especially in the improvements of the city and the care of its beautiful parks.

On August 16, 1839, Gen. Noble married Harriet J., daughter of Benjamin Brooks, Esq., of Bridgeport, Conn., and they have four children, two sons and two daughters. He has been an occasional contributor to the RURAL NEW-YORKER during the past 10 years.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

THEN AND NOW.

A YEAR ago! that perfect day
As I wove my garland of popples gay,
  These thoughts came to me:
Life, thou art sweet! Earth, thou art fair,
The fullness of beauty is everywhere
  For my love and me.
I have no thought of pain or unrest,
Anchored safe on my Lover's breast.
  What to me is the world and its ways?
The present is mine; and the years to be
Lie peaceful and calm as a waveless sea,
  The to-morrows sweeter than the to-days.
    LOVE IS GOD.

In my dreams I see the long grass wave,
And the violets blue that grow on a grave
  In a far-off land.
I feel the approach of the Silent Guest,
And shrink from the chill of my Lover's breast.
  What to me now are the dreams of the past?

GENERAL WM. H. NOBLE. From a Photograph. Fig. 460.

Earth's yield for me is but thorns and briers,
To Heaven I turn for my heart's desires.
There my heart and my hopes are anchored fast.
    GOD IS LOVE!
—Mrs. Frank Beard in Chautauquan.

OF INTEREST TO WOMEN.

THE Staten Island Rapid Transit Road is trying the experiment of women as ticket sellers at some of its stations. If satisfactory, they will replace men in this capacity entirely. It is said to be a measure of economy, as they are not likely to pay women the same wages as men, even though they do exactly the same work.

A dainty gift is a tea apron. It may be made of the finest India mull, open hemmed on all four sides. In one corner a spray of wild roses may be painted. Pink ribbon is slipped through the hem at the top for strings; it is tied on one side.

The prettiest scent sachets are in the form of a bag, five inches wide and nine inches deep. The top of the bag is edged with lace and faced with a contrasting color to the depth of two or three inches. After being filled with perfumed cotton, the mouth of the bag is gathered up, leaving the faced portion like a frill. In front this is turned down, so as to display the contrasting lining. A spray of artificial flowers is fastened on the front and loops of narrow ribbon are put on one side, to hang the bag by. A very dainty one is of cream-white surah, faced with deep orange satin and finished with a bunch of white pond-lilies with orange centers.

Handkerchief cases are now made to hang upon the wall, so as to save the trouble of opening and shutting drawers. They are sometimes made like an ordinary wall-pocket, padded and perfumed, or in the shape of a hand-bag. A handsome one in the latter shape was made of three widths of ribbon two inches wide, dull blue, shrimp pink and old gold. The ribbon was sewed together on the wrong side, but was left unsewed above the place where the bag was drawn in at the top, so as to form six loops. The bag was lined and perfumed and had a spray of flowers painted slanting across one corner.

CONFESSIONS OF A COUNTRY GIRL.

III.

AMONG subjects near to any woman's heart I think we all give a prominent rank to the matter of wardrobe, only many of us are afraid to acknowledge the fact. Not that there is anything to be ashamed of in such a thing. Of course we do wrong if we think of our clothes to the exclusion of higher things, or if we spend more than we can really afford. Polonius showed both prudence and worldly knowledge when he said "Costly thy habit as thy purse can buy."

But since so much power, both for good and evil, lies in personal attractiveness it is certainly every woman's duty to dress as tastefully and becomingly as she can, and the serenity of a peaceful conscience is only equaled by the feeling that one is perfectly and becomingly attired, so as to set off one's graces and hide one's defects.

We often notice that a girl who has been compelled to wear unbecoming or dowdyish clothes, when she is free to do as she pleases, is more likely to set undue value on such things than one who has always been tastefully dressed. When I say tastefully I don't mean elaborately for the two words are not by any means synonymous. And here is one point I mention, as a country girl speaking to country girls. It is a noticeable fact that elaborate fussiness is more a failing with country girls than with city girls. A woman of fashion dresses with studied simplicity save on ceremonious occasions. So, to alter the whist-player's maxim, when in doubt play a trump—when in doubt discard trimmings and trinkets. I have seen a pretty country girl making a neighborly call clad in a stiff silk gown, crackling with jet, with heavy bracelets, breast-pin, locket and chain and ear-rings. I recently saw the lovely Mrs. Langtry at an afternoon exhibition; she wore a simple drab cloth gown, with a little turban of the same stuff, and her only adornment was a bunch of violets at her breast; she did not display a single trinket.

Of course the elegant simplicity of a fashionable woman is more expensive than our most elaborate gowns, but there is no reason why we should not copy this to a certain extent.

It is a most harmless vanity to make the most of our good points, if we do not carry it to an inordinate extent. It is a mistake for the mother of pretty daughters to ignore the fact of their prettiness. Someone is bound to tell them of it, and it comes best from the mother, if she is wise enough to tell them that though beauty is a personal gift it is a mere accident of birth, to be regarded with the same feelings as mental superiority. But for the encouragement of homely girls it must be admitted that tact, mental superiority and good nature, with the addition of taste in dress, will in the long run take the precedence of mere personal prettiness. Madame de Stael, the most charming of women, was plain as she was witty, and Princess de Metternich, one of the most fascinating women in Europe, is almost positively ugly. So, to return to my beginning, since it is the positive duty of every girl to be as attractive as she can, we may be very sure that, though sweetness of temper, activity of mind and tasteful dress will not make a homely girl a beauty, it will make her the next thing to one. The late Duchess of Devonshire was one of the handsomest women in England, and retained her looks all her life. Asked how she kept her beauty, she said: "By dressing at ease, and keeping my temper." And I commend her plan to every girl. PATTY GARTON.

WHAT SHALL OUR CHILDREN READ?

MRS. U. C.

THE thoughtlessness which some parents display as to what their children read, is not consistent with the amount of care which they think it necessary to bestow upon their bodies. Ever since the dime and half dime novel literature has flooded the country, boys of more or less tender years have from time to time been leaving their homes, armed with an old pocket knife or hatchet, to become Indian hunters, or wild men of the West, in imitation of their favorite heroes. If a boy has a fondness for tales of adventure, direct his reading so that he may derive pleasure and at the same time profit. Put Capt. Mayne Reid's books into his hands, and in the glow of enthusiasm produced by the adventures of the Giraffe Hunters, the "Old Sleuth Library" will lose its charm. The "Heroes of History," by G. M. Towle, are full of striking incidents and perilous situations, and as at the same time historical accuracy is not sacrificed, a boy cannot fail to derive great advantage from them. They are comprised in a set of six volumes: "Vasco Da Gama," "Pizarro" (and no hero of romance possesses greater power to charm the youthful imagination than this conqueror of Peru), "Magellan," "Marco Polo," "Raleigh" and "Drake." A boy who has read and thoroughly understands the historical part of these books, has acquired no mean education. As a companion book to these, read the "Young Folks Book of American Explorers," by Thomas Wentworth Higginson.

History can be learned a great deal better by judicious reading than from the text books of a public school. At least the former will greatly help out the latter. Higginson's History of the United States is written in a very clear and lucid style. Everything is explained in so easy and gentle a manner that even a scholar who is not ordinarily studious, cannot fail to be charmed by it. It has been translated into German, and was received with great favor by that country.

Charlotte M. Yonge's histories are very pleasant and instructive. They should be read as a series, and comprise "Germany, Greece, Rome, England, France" and the "History of the Bible." She has also written several other works than which there can be no better reading for young folks. Among these are "Prince and Page," a story of the last Crusade, "Lances of Lynnwood," a tale of chivalry in England and "The little Duke," or "Richard the Fearless." "The Story of Liberty," "Old Times in the Colonies," and "The Boys of '76," by C. C. Coffin, are three books that no American boy can afford not to read. An excellent idea of the geography of the Old World can be had from the "Children's Fairy Geography," by Forbes E. Winslow.

For lighter literature, all of Frank Stockton's books are to be recommended. The above author's fairy tales and other stories for young people are the most delightful reading possible; indeed, there are very few people of any age who can resist one of Frank Stockton's inimitably told fairy tales. Every child is better for being happy and no one can read them

without being made happier. "The Fantastic History of the Celebrated Pierrot" is a book over which my own children have spent many a delightful hour. "Home Fairy Tales," by Jean Mace, and "Fairy Tales and Legends of Many Nations," by Burkhardt, will delight the heart and capture the fancy of any child.

There are here and there bigoted parents who taboo all fairy literature; Gradgrinds who believe in nothing but facts, but when even so good and great a man and author as George MacDonald has given it his sanction by writing one of the most exquisite of fairy stories, "The Princess and the Goblin," we think these well-meaning but misguided people need not fear to place such books, without which no child-life is complete, in the hands of their sons and daughters. "Alice in Wonderland" for pure, unrivalled, rollicking nonsense will be appreciated by a certain class of children, and they will not be found among the dull ones. "The Jimmyjohns," and the "Peterkins" are familiar to all the readers of St. Nicholas, and are to be had in book form by those who are not the fortunate possessors of that valuable magazine.

The above mentioned books compose, perhaps, but a small library; for voracious readers there are hundreds of other valuable books, but a few good volumes read and remembered will be of more service as a means of education than greater numbers carelessly skimmed. A Hindoo in India once served on a jury with Englishmen and astonished jury, lawyers, judges and spectators by the remarkable acuteness he displayed in cross-questioning witnesses. It afterwards transpired that he had never read more than one book, but this book which was the logic of Aristotle, he had read until he almost knew it by heart.

BUSY MOTHERS.

NAOMI.

Is the housekeeper to blame for becoming the household drudge? Partly, and partly not. Starting out in life with little capital, but with a loving heart and willing hands she gladly takes up the burden. Joyfully she goes on her way, bravely bearing on her shoulders all the weight that falls to her portion to carry. One responsibility after another is added, as each new-comer lifts up its pleading voice and helpless hands. Conjugal love, maternal love and love of order, neatness and plenty are each separate incentives to continued perseverance. At first husband being so engrossed in his occupation, and the bodies of the children seeming to be all that require her thought and labor, her mind settles into the channel in which her body moves. To clothe and feed the family, have the home comfortable and orderly, and at the same time save her husband's (?) money, seem to be not the *chief* end and aim of life, but *the* end and aim.

I do not feel to blame such, for my heart goes out in sympathy to them and their children when I think of the future needs of the hungry minds. Mothers are prone to forget that they have performed but a portion of their duty when they have ministered to the visible wants of their offspring. Children love to share all things with those who are in sympathy with them. If Mary finds her lesson difficult to understand and teacher does not see just the point that troubles her, what a help to bring her trouble to mother who will make it so plain that the morrow will be eagerly anticipated instead of dreaded. But if met with a "Don't bother me, child; ask teacher, I'm too busy," she is not apt to try it again soon, and an avenue to that daughter's heart is closed to the mother by her own act. Had the mother only showed a desire to help her, it would have been a bond of union between them. But if mother cares only for her house, and Mary only for her books, what common feeling shall unite them?

We should seek to retain our places as companions and helpers to our children. Their footsteps are now led in pleasant paths of knowledge. Ways that were crooked and rough for our feet are made straight and smooth for them, and no wonder if they go so fast that we cannot keep pace with them. We can keep alongside in some things that are of common interest to all who meditate upon the advancement of our generation in science and art and literature. The trouble is that the mental powers become sluggish from inactivity and the great demands upon the body, and it is an almost impossible task to arouse them to action. The children learn to think that mother is too busy to go to a lecture, or read an interesting book, or take a trip with them to visit some natural curiosities, all of which would help mother and children to grow into companionship with one another.

"The recompense of reward!" The loving companionship of our children. Sharing their joys and sorrows, advising them in their perplexities, warning them of dangers ahead, gently leading them in ways of truth and uprightness, and all the time knowing that we are the one to whom their hearts will ever turn for comfort in sorrow, and for congratulation in joy.

SOME WAYS AND THINGS AT THE RURAL GROUNDS.

ALICE BROWN.

We have had no winter weather, although this is the last day of November. The ground is not frozen, and the mud reminds one of Spring. The evenings are long, and suggest busy hours around lighted lamps.

So many turn to favorite studies as Winter shuts them in for the greater part of every day, that something about study seems most appropriate just now to write from the Rural Grounds. Home study has been gaining much in favor during recent years. Simply written text books and interestingly told histories have multiplied to help those who have only books for their teachers. Easy as study has been made in many ways, it is still true that persistent earnest application is the only way to any wealth of knowledge.

"If an education could be had just for the wishing, everybody would be educated, nobody really wishes to be ignorant," Mr. Carman sometimes tells Cerise, when she finds it hard to fix her mind upon her studies. The difficulties surrounding home study are not small, but a great many have overcome them, and many always will when the choice lies between no advance at all, or some progress without a teacher.

Reading will not take the place of study, for it does not strengthen and train the mind. Doing but once all the various things done in the household, once baking bread, once cooking a dinner, once ironing, churning or making a bed will not fit anyone to become a housekeeper, or take away the awkwardness of first attempts. Reading is usually going over but once a great variety of subjects and learning none.

Mr. and Mrs. Carman have kept up a course of study ever since their married life began. Usually Mr. Carman has acted as teacher, which, of course, has given Mrs. Carman an advantage over many home students. The study first taken up, and the one that has been most enthusiastically followed is botany, and the pupil has now in some departments of the subject outstripped her teacher, so that to her are given all the plants and grasses sent to him for identification and names.

All the woods and fields for several miles around the Rural Grounds were searched through and through at all seasons of blossoming, until not a weed or flower remained to be analyzed and named. The practice and knowledge gained in this way has made it possible to analyze and name the wild flowers, grasses, and flowering weeds from any part of the Union where the flora has been described and classified in published books.

If the evenings for one Winter are given to the study of botany it will be possible in the Spring to analyze most if not all of the wild flowers growing in the woods and fields of any locality. If the study has been carefully pursued many interesting things will have been learned about common, familiar plants and flowers. Although the evenings of a few months will enable anyone to analyze and name hundreds of flowers, the study can be carried on for years without reaching the end of its interest and charm.

The home student often uses his time to poor advantage by undertaking some study too hard and soon tires of it and gives it up. It is better to begin with the review of some study once taken in school than to fail in trying something new. At one time Mrs. Carman, finding she had in a measure forgotten the rules of grammar, took up the study with one or two others who were members of their household at the time, and very carefully studied through Brown's grammar committing to memory rules, definitions and declensions as though for the first time.

Geography is a useful study to take up, and one that few people know so perfectly that a review of it will not teach them many interesting things. Travers, Cerise and I, as a pleasant plan for studying geography in addition to the regular lessons, organized last Winter a little society of three members that we called the "Geographical Reading Club." Travvie was our president and a very enthusiastic member of the "G. R. C." Our plan was to read aloud from books describing places, keeping the geography open at the maps of the places and locating cities, rivers, etc., as we read. In this way we studied the waters and coasts between Newfoundland and Northern Greenland, by reading the story of the voyage on a sealing vessel of the "Knockabout Club," written by C. A. Stevens.

We tried to read "Picturesque America," a book describing the most noted natural wonders of America, but we found the words too large for our seven-year-old president, so after reading a few chapters we gave it up for something worded more simply; after that, though our progress was slow it was pleasant.

A Geographical Club with members old enough to read for themselves, and take turns in reading aloud, could spend many pleasant hours, learning from good maps just where the places are of which they read. A file of the RURAL containing Mrs. Fisher's Transcontinental Letters would furnish one course of geographical reading. Many pleasant books of travel have been written that are suitable for use in such a Reading Club. Mrs. Helen Jackson, who wrote so many good things under the signature of H. H., has written two or three books of travel that would be especially good for the use of a "G. R. C." They are "Bits of Travel," "Bits of Travel at Home," and "Glympses of Three Coasts."

Mark Twain's "Innocence Abroad" would prove instructive if the route taken by the Innocents be carefully followed on a map, and the book is full of funny incidents and descriptions.

I cannot close this better than to quote from advice given by Mr. Carman to a young man asking what he should study in his spare minutes to gain an education. "Study something," he said, "almost anything, so you make a beginning; study hard, don't give it up, and you can't help learning something."

GOLDEN GRAINS.

The most manifest sign of wisdom is continued cheerfulness.....

Let amusements fill up the chinks of your existence, but not the great spaces thereof....

Wealth, legitimately acquired, is valuable, and only valuable when thus acquired.....

The tasks, the joys of earth, the same in Heaven will be,
Only the little brook has widened to a sea.....

There always comes some smooth running to every skein before all is done. You mustn't try to see through the whole skein or to straighten it all out into a single thread before you begin to wind; that makes a snarl always. There is always an end, and it is what you have got to take hold of.....

It depends upon what one's life is, and where is the spring of it, and what it feeds upon, how one rallies from a shock of any sort ....

We love those for whom we have been privileged to perform some helpful service; for love grows through serving. If we do not sufficiently love another for what he has done for us, let us increase our loving interest in him by loving service for him.....

He that provides for this life, but takes no care for eternity, is wise for a moment, but a fool forever, and acts as untowardly and crossly to the reason of things as can be imagined..... .....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

BATH-ROOMS FOR FARMERS.

The most convenient bath-room I have ever seen in a farmer's house was planned and located in the house of Col. M. J. Hogarty, a retired army officer, whose home is in Greeley, Colorado.

This bath-room adjoins the large kitchen,

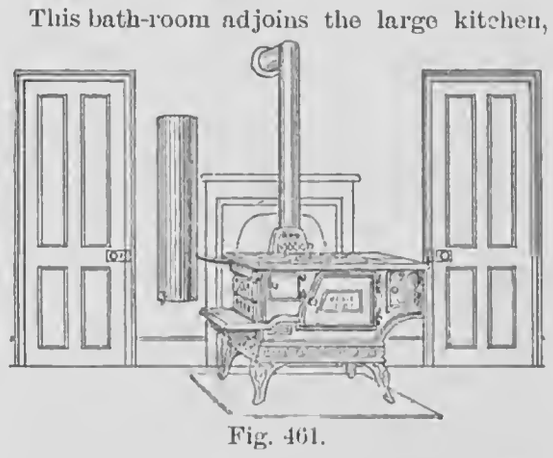

Fig. 461.

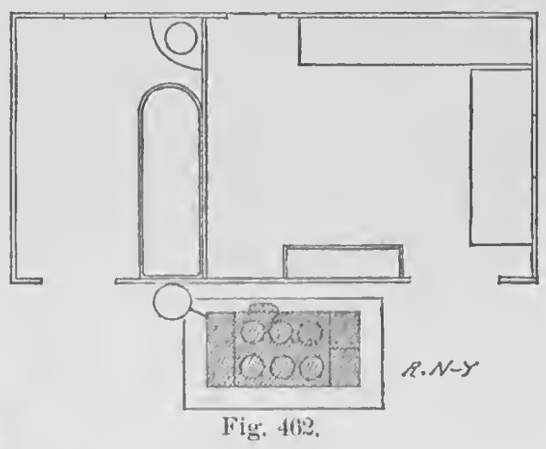

Fig. 462.

and is entered by a door near the cook-stove or range. It is supplied with hot and cold water through pipes leading to it from the stove and force pump. A large tank is fitted up near the front of the stove, four or five feet high and 18 inches in diameter. The water in this cylindrical tank is heated in pipes running around the inside of the stove and outside and above the coal-box. The tank is filled with water through pipes leading from a force-pump situated in the pantry. The door leading to this pantry is at the right of the stove, and that of the bath-room to the left. The pump not only supplies the pantry sink, but the stove and bath-tub, also a marble basin in one corner of the bath-room. A looking-glass, roller-towels and plenty of short towels, brushes and combs and soap make this little room a first-class toilet room for the family at all seasons.

There is a faucet at the bottom of the tank, where water can be taken out at any time.

If the farmers cannot afford a tank with hot and cold water pipes leading to the room, they may be able to have a bath-room adjoining the kitchen without these luxuries.

Nearly every farmer has a stove with a reservoir, from which water can be taken at any time and this, with a couple of pails of cold water added, will be sufficient for a good bath without much trouble. It is a great convenience to the house mother to be able to give her little flock a bath at least once a week, and to be able to do this so near a warm fire, during the cold weather, is a great comfort to all concerned. MRS. O. HOWARD.

BREAKFAST, AND WHAT TO PREPARE.

Breakfast is undoubtedly the housekeeper's most difficult meal, both because at that early hour of the day at which it is usually served, appetites are apt to require tempting, and because there is less time for its preparation. Now that the Winter has set in and vegetables are becoming scarce, it is pleasant to know how to make the most of the slender resources at hand.

There is, perhaps, no vegetable so abused in its cooking as that commonest of all—the potato. Delicately fried potatoes are the exception, not the rule. In fact, where their cooking is entrusted to a servant, one need not look for an edible dish. Still, they are not difficult to prepare in many appetizing ways. A French cook of great celebrity boasts that he can prepare potatoes in two hundred different ways, and apples in four hundred. Potatoes boiled with the skins on can be cooked over far better than if boiled without their jackets. Those intended for the breakfast should be taken from the fire when about half done, and after removing the skins, set away until the following morning. If they are boiled until fully done they will be too crumby and mealy to cook over well. Slice some of these potatoes half an inch thick, dredge them with a little flour and fry in a pan containing a tablespoonful of hot butter or drippings, put a cover on the pan, season them, and when brown on one side, turn and brown on the other. Use just as little fat as will keep them from burning, and serve them very hot on a hot dish.

Cauliflowers left from dinner are excellent if warmed with mashed or fully boiled cold potatoes. Chop equal parts of each, put a spoonful of butter and two or three spoonfuls of the white sauce that was served with the cauliflower, or if there is none of the sauce remaining, add just enough rich milk or cream to make it a little moist, season nicely, using a little Cayenne, and stir until it leaves the bottom and sides of the saucepan.

Cabbage may be used in the same way, only in this case a little of any kind of good gravy may be used for moistening it. A delicious breakfast vegetable is made from mixed celery and potatoes. Boil, the day before, the white ends of some of the coarser stalks of celery that are not nice enough for table use, in salted boiling water until tender. Mix with three-quarters the amount of cold-boiled potatoes, and heat as above, using butter and a little cream or milk. Both the celery and potatoes should be chopped fine.

Broiled tomatoes are another dainty, and taste quite unlike tomatoes cooked in any other way. In San Francisco, one may have fresh tomatoes almost the year round, but it is quite possible to broil canned tomatoes if you have canned them yourself. When you are canning them take some of the larger ones that are not very ripe, wipe them clean and just allow them to get hot through in the vessel in which you are cooking the tomatoes for canning. Seal up boiling-hot in wide-mouthed cans. To broil them, slice, either the fresh or canned articles in two, leaving the skin on, dip in melted butter and crumbs and broil over a slow fire or the crumbs will scorch. They may also be fried, and with a delicate slice of broiled ham, some warmed cauliflower and potatoes, and a hot muffin, form one of the nicest breakfasts that even an epicure could wish.

Fried cucumbers are another possible winter dish. Take large cucumbers that have been put down in brine for pickling, and soak

in tepid water until the salt is well out of them, slice one-third of an inch thick, roll in flour and fry in butter. Excellent with beef steak or cold meat.

Hominy may also be cooked in a variety of acceptable ways. Wash a cupful of hominy in two waters and stir it into a quart of salted boiling water. Boil for nearly an hour in a double boiler, stirring from time to time. Mix together a pint of the warm hominy, a pint of milk and another of flour. Add to this batter two beaten eggs and a little salt. Bake on a very hot griddle to prevent them from being tough.

Superior hominy muffins are made from the following recipe. Pour a cupful of boiling water upon two tablespoonfuls of fine hominy, simmer for 15 minutes, add a cupful of Indian meal stirred in slowly and one and a half cupful of boiling milk. Allow this mixture to get nearly cold, and stir in two beaten eggs, two tablespoonfuls of flour, one of sugar and a teaspoonful each of salt and baking powder. Bake for 15 minutes in heated and buttered gem pans. PALMETTO.

A FARMER'S DAUGHTER'S DOMESTIC REVERIES.

CHARITY SWEETHEART.

We had a very pleasant Summer, now that I look back upon it. I had just finished house-cleaning, and had painted the outside of the kitchen, and white-washed the fence, and gray-washed the wood house, and planted the garden, and scraped up the cellar and given it a coat of lime, when Aunt Bell sent word that she was coming to spend a few weeks with her brother (that's father), bringing cousin Almy. Burt whistled "Whew, now we'll have to keep our jackets on all the hot days," and Tom Daryl laughed. He's a cousin of ours too and always ready to help the boys in mischief. Then father was sick for a week in early haying, and we had people to hoe, and Burt was cross and wouldn't feed the calves or help with the milking, and then Aunt came. It was a pleasant thing to see her and cousin Almy, for they live in Cleveland, and dress in the fashion. I felt glad at first, though I was awfully tired the first day, for Aunt Bell wouldn't eat the bread unless it was new, and I had to make hot rolls all the time. And though she talked a good deal in a patronizing way about me being a poor child who had too much work to do, she never put her foot into the kitchen to help me.

But I am not writing for the sake of grumbling, only that I made a discovery while they were with us, of the reason why boys and girls despise farm work and want to go to the city. It was one day when there was a picnic got up for the Sunday School. Almy came down stairs when the wagon was at the door, in a lovely white muslin trimmed with embroidery and a big hat trimmed with a scarf. She had a thin scarf round her throat too, and went out into the garden and took all the roses off my bush to fasten in a big bunch on her corsage. I had the lunch basket to look after, and the morning's work to do up before we could start, and I looked red and hot when Tom Daryl came with the buggy for Almy and me. My pink-spotted calico was the only one I could wear; it was new, but didn't look anything beside the white muslin.

I need not tell all that happened; but after the lunch I was expected to help wash the dishes, while Almy flirted with all the boys in turn. She looked so pale and pretty under the big hat that they were all proud to be noticed by her and to have the pleasure of walking with her up the hill where they strolled for the "view," excepting those who had the cleaning up to do. When she came back there was a pink flush on her cheek and Tom Daryl held her parasol, "You poor dear, you look tired," she said to me so sweetly, that the boys who were not at all accustomed to look on me as an object of compassion, looked upon her as angel of sympathy. But if she had put her hands into the dish-water till they were red, and burned her nose red working in the hot sun as I did, they would not have been half so ensnared. It was the white hands and pleasant, cooing voice, able to say soft nothings without any meaning, the society manner and general air of ease, that won them. I could watch the effect with impartial eyes for none of them was my ideal—not one of them possessing those attributes of gentlemanliness I sought.

I have often wished the boys were more refined, but I don't think they ever wished so till that day when Mr. Dick Daryl, Tom's brother, from the city, won all of Almy's attention after she was tired of the boys' very limited, concise and bare-faced compliments. They were well matched, and talked together of the opera and last Winter's amusements and people and places that were unknown to us, as soon as she found that Dick had been in Cleveland. And then the boys began to be painfully aware that their hands were rough and red, and Burt tried to hide the warts on his, by turning his thumbs over his forefingers where the big ones were. And I did not wonder that they felt inferior, for so few farmers' boys keep up with the times, and can converse on any subject. For instance, the other night we were talking about the Darwinian theory, and Burt asked if it was a "story" Darwin had written, and when I began to hum the song of the "Lady and the Ape" from the "Princess Ida," he asked "Who wrote that poetry," and when Almy said "Sullivan," he observed knowingly that he didn't "think John L. wrote poetry"—which convulsed us all, and made him angry. Of course, it amused her to play upon his ignorance, and sometimes she did not know whether it was real or assumed; but, though in many things Burt knows more than Dick Daryl and is a truer, honester man—or rather boy—he lacks that polish and general information that go so far in society, and he will keep his hands in his pockets—for I noticed that though he kept his coat on "all the hot days," he came to the table often with a hand in each trouser pocket, never thought to lift a chair for any of us to the table, or to do the many little things that well-bred men think it their province to do for the other sex. If I had told him, he would have said, "Bosh!" but the *results* make boys and girls think little of farm life, when it is their own fault if they are behind those of the city in these small refinements. If they practiced them at home—lifting burdens from their sisters' shoulders—they in turn would not so often pine for the ease and society a city life affords. Of course I wouldn't stay here myself if it wasn't for *father*. I would go the State Normal School and study my beloved art till I was able to teach it, and earn my living. Somebody would give me my board I think for what I would do between whiles, for a girl brought up in the country is able to rise early in the morning and do a good deal of work. Perhaps then I should not be so ashamed of my red hands and fingers that are growing "stumpy at the ends." Almy said I was "so useful" as if I was a half-worn broom. But then there is father, and the duty that lies next must be done first, so I will plod on.

Just now I opened "Little Women," at the page where it reads: "An old maid, that's what I'm to be," and I went on reading what she wrote so beautifully—"Don't laugh at the spinsters, for often very tender, tragical romances are hidden away in the hearts that beat so quietly under the sober gowns, and many silent sacrifices of youth, health, ambition, love itself, make the faded faces beautiful in God's sight. Even the sad, sour sisters should be kindly dealt with, because they have missed the sweetest part of life, if for no other reason, and looking at them with compassion, not with contempt, girls in their bloom should remember that they too may miss the blossom time * * * Gentlemen—which means boys—be courteous to the old maids, no matter how poor and plain and prim, for the only chivalry worth having is that which is the readiest to pay deference to the old, protect the feeble and serve womankind, regardless of rank, age or color." What a true ring there is in all Miss Alcott's writings, and I re-read her poem "In a Garret," so simple yet so sweet. All the story is new to me, to whom books are as "angels' visits, few and far between," but the rhyme clings to my heart:

"A woman in a lonely house
Hearing the sad refrain,
Be worthy love and love will come
In the falling summer rain."

And now the RURAL has come for Thanksgiving, and it was that set me to writing again, for I read the poem below the picture and liked it ever so much,

"If on Truth's golden door
You still can write: 'I've wronged no man,'
A king could write no more,"

and I determined to

"Work on, work on, with patience."

But looking above the words to the picture, it seemed to me that it was not necessary to make the cut of the farmer's coat so very unlike what his city brothers would wear, or to make his wife look such a dowdy. I suppose they were taken in their everyday clothes, though, when they held such a reception in front of the fancy house behind them. Somehow I always think that pictures of farm homes should have all possible refining surroundings. It tired me to look at those fat pigs and pert little calves, and made my arms ache over again to remember the pailfuls of mush or milk I had carried out to such creatures. And all those fowls! What a wearisome time to pluck and dress them for the table, where there is only one pair of hands. But then, again, the poem closes so beautifully:

"For health and friends and love and home,
That money could not buy,
Be thankful that the changing years
So lightly pass you by."

ONE WINTER.—VI.

ANNE THRIFTY.

As Christmas drew near, Uncle asked me several times to put up a lunch for him to carry to the machine shop, so he could work through the noon hour. He had once learned the carpenter's trade, and the superintendent of the Works knowing this, had turned over to him a quantity of odds and ends of good lumber, and out of this he was making Christmas presents for us, but I did not know it until Christmas morning.

We had relatives in different parts of Indiana, Ohio and Kansas, and in Minnesota and Wisconsin, and some of the aunts and cousins had written me that they would send packages in time to put their contents into the boys' stockings, so I felt contented that the children would not be disappointed if I gave them only the still hidden fruit cake.

A package from Wisconsin and one from Minnesota came two days before Christmas. The former contained a bound volume of St. Nicholas, one the Badger State cousins had read and re-read until they had worn its cover shabby, and knew its contents from beginning to end, but at a trifling expense they had it rebound, and now it looked as new as ever.

The Minnesota package was more bulky than the other, but not quite so heavy; opening it I found two boxes of letter paper ornamented with comical or pretty colored figures, and the boxes marked "for Bertie" and "for Sammie," a calico dress pattern marked "for Anne" and an envelope "for John" containing I knew not what.

The packages came while the boys were at school and Uncle at work, so I hid them in my trunk and felt as though I must be related to shaggy, big-hearted Santa Claus when I thought of them.

Christmas Eve our Sunday School gave an entertainment, and an orange and a bag of candy to each of its members. Bertie, Sammie and I went early, Uncle promising to come for us later. The weather had become very cold and the snow creaked under our shoes as we hurried to the church.

As soon as we were gone Uncle brought from Mr. Turner's, where he had left them, the presents he had made for us. He busied himself in the yard with some large object, shoveling snow, pouring water, and seemed not to know that the night was bitterly cold, then putting several things into the stable, he made ready to come to the church.

The boys were as happy with their oranges and bags of candy as small boys know how to be, and in such haste to get home to count the pieces of candy that Uncle and I could scarcely keep up with them. They had decided to "see who could keep his candy the longest," and neither would taste his unless he could induce the other to eat as much, so their bags were still plump, when, after hanging their stockings in the kitchen, they had their usual race to get into bed.

When they were at last asleep I brought out the presents from my trunk and fastened the large ones to the stockings, putting the envelope into Uncle John's sock, and the cake on a chair under it, telling him nothing as to the contents of the packages but answering all his wild guesses by feigned surprise that he should have found them all out. Leaving Uncle to finish the work of preparation, I followed the example of the boys and was soon falling asleep in my cold little bedroom, thankful to have a shelter from zero weather, knowing many in the city were homeless and hungry; for it was a season of business depression, and idle hands made many feel the worst that poverty could do to them. In spite of our many privations, when I thought of those who were poorer, we seemed rich.

The ignorance, dirt, disorder and thoughtless extravagance in some of the homes in our neighborhood gave me the feeling that we were not so poor as many who had more money. A love for beauty, order and learning, and for home, seemed to me of more value than thousands of dollars, and no complaints were ever uttered that could lead the boys to think they were poor, or sow seeds of envious discontent in their hearts. With something of these thoughts filling my mind I fell asleep to be wakened, I well knew, long before daybreak, by the eager little fellows who were my continued pleasure and torment.

HOW TO DEAL WITH NERVOUS PEOPLE.

In caring for a nervous invalid, remember that proper food, with systematic recreation and exercise will often produce results that will astonish both patient and nurse. In taking exercise be careful that no fatigue is felt, that is, stop short of fatigue, and if you would get the most benefit from it, see that the walk has an object. There is nothing so tiresome, and so little productive of benefit as a walk without an object. As regards diet, give plenty of fish, and especially shell-fish, as much bread and butter as may be desired, creamed potatoes and only simple puddings. Oranges, baked apples, stewed prunes or whatever fruit is taken should be before breakfast. Milk may be taken if it is liked and digested easily. Cocoa is a better beverage than tea or coffee, and beer or spirits should never be indulged in. NURSE.

JAVELLE WATER.

There is nothing better than the above for taking stains out of linen, and every family should have a large bottle of it on hand. Put one pound of sal soda, and five cents' worth of chloride of lime in an earthen vessel and pour on two quarts of soft boiling water. Stir until the soda is dissolved. Strain and let the fluid settle. Wet the stain of fruit, coffee, tea or mildew with the liquid mixed with half its quantity of boiling water, and let it lie in the light for 15 minutes. Rinse thoroughly several times in cold water.

I had a number of new sheets badly mildewed through the carelessness of a servant, some time ago, and removed every bit of it with javelle water. Keep it in a glass can in a cool, dark place. HOUSEWIFE.

HOUSEKEEPING NOTES.

MOPPING.

There is a little skill required to perform even this piece of work so that the effect is satisfactory. Formerly, before painted floors were almost the rule in every house, it was a much more arduous performance; but to keep a painted floor looking its best one needs some experience.

Unobservant or heedless workers push the mop against the base-boards, which, after a few moppings shows a soiled streak the whole length of them, which annoys a good workman. Better leave a space the width of one board untouched by the mop and afterwards or before wipe it up with a cloth by hand.

In mopping a floor, whether it is painted or not, the best effect depends on its being well rinsed. No matter how much strength is laid out on it, if the last water in which the mop is wrung out is not clean, the floor will look dingy.

Freshly-painted floors are best cleaned when a third or a half skim-milk is added to the water. The oil in the milk makes the paint shine as clear water will not. Soap-suds are a little too strong to use on fresh paint, removing not only the dust but the paint also, but after the coat of paint is well hardened it may be used to good advantage. It is easier to clean a floor quite often than to let it get the start of you, so as to require a severe effort of strength to bring it to look well.

Knit underwear, after it has been worn and cast aside, makes excellent material of which to manufacture mops. The mops should be thoroughly rinsed after using, and dried in the sun.

JELLY CAKE.

One and one-half cup of flour, one-half cup of butter, one-half cup of sweet milk, whites of four eggs; two and a half cups of flour, one teaspoonful of baking powder, stirred in the flour. AUNT RACHEL.

Ayer's Pills

Restore tone and strength to the Stomach and Liver enfeebled by disease, promote the Appetite, and cause the Bowels to move naturally. Ayer's Pills are safe to take, do not debilitate by excessive stimulation, and are not irritating in their action.

I have used Ayer's Pills for twenty years, and can truly say they have always given me satisfaction. Whenever I am troubled with Constipation, or suffer from Loss of Appetite, Ayer's Pills quickly set me right again.—P. N. Ward, Bath, Me.

Ayer's Pills have been my family medicine for fifteen years, and the result of that long experience is a complete vindication of your statements concerning them.—T. T. Nunney, West Point, Tex.

Ayer's Pills,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.
Sold by all Druggists and Dealers in Medicine.

GOLD $100.

We will pay one hundred dollars gold in premiums for best results from eight weeks' trial of **Sheridan's Powder to Make Hens Lay.** Send your name and post-office for particulars. I. S. JOHNSON & CO., 22 Custom House Street, Boston, Mass.

The will of President Arthur, which was offered for probate here the other day, covers $150,000 worth of property. The son is to receive one-half the estate when 30 years of age; the daughter one-half at the age of 23, Mrs. McElroy, his sister, being her guardian.....

THE amount of greenbacks now out is $346,000,000. During the last fiscal year $44,551,043,46 of the public debt was paid, leaving in the United States Treasury a surplus of $93,926,588,56, a condition of things to be found in no other country on the globe.... .....The United States Supreme Court decides that a criminal cannot be extradited for one offense and tried for another. Chief Justice Waite dissents .... .Thousands of dollars' worth of fishing nets are frozen up in the lakes with no hope of saving them..... .....The estate of the late Charles Francis Adams, admitted to probate Monday, is valued at $1,250,000, and is divided among his family.....A delegation from Dakota are at the National Capital to secure from Congress the opening for settlement of 10,000,000 acres of the Sioux Reservation.....Monday conversation by telephone was carried on over wires 830 miles long—the distance between Houston, Texas, and New Orleans and return. A new telephone, the invention G. L. Barriett and W. W. Nelms, young men of Houston.....The rumor that the Dominion Government has sent an agent to Washington to aid in negotiating a fisheries treaty is denied. "Canada stands upon the basis of the treaty of 1818, as relates to fisheries, and is content to rest there," says the the Toronto Mail, the Government organ .Blatherskite Rossa has been elected chief of the Philadelphia Fenians, a separate branch...Large quantities of crude opium are imported by Chinese into British Columbia, where the duty is only 20 per cent ad valorem. There it is made into a merchantable commodity, and smuggled into Washington Territory where the duty is $9 per pound.... ..... E Price Greenleaf, of Boston, an old curmudgeon, has left Harvard University $750,000 to fund scholarships and aid the college library.....The Iowa Supreme Court has affirmed a decision of the lower courts in favor of the Prohibition law. ....."Jim" Cummings who has over and over again said that he committed that St. Louis train robery, in his latest letter, says he is tired of being chased around the country by detectives, and offers to return $25,000 of the stolen money if they let him go in peace. Frotheringham the express messenger in the robbed car is in jail as an accomplice, for want of bail .....The Hon. William T. Price, member of Congress from the eighth Wisconsin District, died Monday.... Archbishop Ryan announces that under the decrees of the Baltimore Plenary Council balls for charitable purposes are prohibited..... The wife of "Bill Jones, the avenger," who fired at Guiteau as the latter was riding from the court-room to the jail, has filed a bill for divorce, and charges that her husband is a worthless vagabond and sot.....The Grant Monument Fund amounts to only $123,709, and the Committee, despairing of raising more, seem inclined to build such a monument as the money will procure. The Elevated railroad in this city intends to extend its line to Riverside Park , where Grant's body rests, to accommodate the large number of visitors to his tomb; a small fee from each would lessen the number or increase the Monument Fund or do both.....Twenty-eight prominent citizens of Philadelphia invite all other citizens to help them get a good Mayor for the city..... .....Dr. Douglass, who lost his health in caring for General Grant, has gone South to spend the Winter. He will be at the Hot Springs in Arkansas first, and later in Florida. Mrs. Douglass is with him, and her daughter, Miss Justine Prindle, joins them later..... .....The late ex-Senator Sharon's bequest of $50,000 to Golden Gate Park, in San Francisco, will be devoted to a play-ground for children. Among its features will be a large dairy building in which milk, eggs, bread and other simple food will be supplied at cost..... .....Frederick Douglass says there were 4,000,000 negroes in this country at the time of the emancipation, and that he now estimates the colored population at 7,000,000.....

The distribution of the $60,000 voluntarily paid by ex-Gov. Hoadly of Ohio as bondsman of Mannix, assignee of Archbishop Purcell, among the creditors has begun. It only pays 1½ per cent on the claims, but the creditors, mostly old or middle-aged women, rushed eagerly and gratefully to the office of distribution. Some 170 individuals were paid on the first day, and the enormity of the Purcell swindle can be recalled by noting that this number reached only through letters A and B on the list of creditors. The claims reached all the way from $5 to $10,000, but only about a dozen were over $1,000... .....Lewis H. Stanton, only surviving son of the great war secretary, is a stock farmer at Morris, Minn., and is collecting material for a biogrrphy of his father, although he will not himself write it.....The Supreme judicial court of Mass. in full bench have decided that a member of the Law and Order League is not competent to sit on jury in a case depending on the evidence of one of the League's spotters. It was a liquor selling case.....The sixth annual meeting of the federation of trade unions, comprising, it is claimed, 500,000 members, has been in session at Columbus, Ohio, during the week. The trade-unions are devoted to effecting a scheme by which each union can have absolute control of its own affairs, and yet can draw for assessments on all the unions when one of them establishes a strike. This and a determination to keep out of politics mark the distinction between the unions and the Knights of Labor..... .. It is generally believed at the City of Mexico that diplomatic questions of grave importance will soon arise between the United States and Mexico, growing out of the position taken by President Cleveland against the right of Mexico to try Americans committing offenses against Mexican law while on American soil. The newspapers of all shades of opinion stand by the government in this matter, on the ground that the principle is a sound one and approved by some of the most highly civilized nations of the world. .....Baltimore pays the premium on $500 accident insurance for each of its firemen, and in case of death gives an additional $500 to the family of the deceased..... Very hard cider is said to be quite popular as a beverage in Iowa "since Prohibition."..... ....The "State" of South Dakota having been refused admission by Congress, has elected executive officers and a legislature, and proposes to put a State Government in operation on the 15th instant. A proclamation calling upon the legislature to meet at that date has been issued by "Arthur C. Mellette, Governor; A. E. Frank, Lieutenant-governor and President of the Senate, and Thomas V. Eddy, Speaker of the House of Representatives," attested by "H. S. Murphy, Secretary of State," and done "by virtue vested by the constitution and legislative enactment of the State of Dakota," and it is given out that "business" is meant without question or doubt..... ....The life of General Lee, just published, shows that the number of paroles issued at the time of the surrender was 28,231 .....Capt. James B. Eads says the project to build a ship railway across the Isthmus of Panama with Government aid will be abandoned, and the enterprise will be continued under a private corporation..... .....Prominent grain dealers of New York, Philadelphia, Baltimore and Chicago are making arrangements to form an association for the purpose of carrying their own insurance on grain in registered warehouses .....The collapse of the great strikes at Chicago, Ill., Amsterdam, N. Y., Peabody and Salem, Mass., has given a severe blow to labor organizations. Of late large numbers are deserting the K. of L. The shoe unions at Lynn, Mass., which are tired of supporting the tanners, are losing their members in great numbers. There was a total failure to support the strikers at Peabody. Powderly's circular asking for an assessment of 25 cents per member has caused much discontent, as each local body has to support its own organization. There is a general feeling that things are going wrong; and the public and many of the Knights think things have been carried too far. They wanted the earth, waxed fat and kicked—kicked other laboring men especially—and it was too much for them, ...George A. Marden, of Lowell, and Mr. Whitaker, editor of the New England Farmer, are being urged for Secretary of the State Board of Agriculture in place of John E. Russell, elected to Congress. The choice is made by vote of the Board, and the office is in no sense political.....The President has appointed Thomas Moonlight, defeated Democratic candidate for Governor of Kansas, to be Governor of Wyoming, in place of Francis Warren.....Young James G. Blaine, who lately married, and to whom his father allows $1,500 a year, has started in life as a newspaper reporter in Pittsburg.....The British residents of New York city and vicinity have decided to celebrate Queen Victoria's jubilee anniversary June 28 next, at an expense of $10,000, and if the subscriptions run over that they will be used to endow a Victoria hospital, or a sailors' club, or something .....Paducah, Ky., is greatly excited over the reported existence of diamond fields there.....Mme. Patti is to be paid $150,000 for her six months' singing in this country.....The discovery of a vein of coal under the site of Omaha, Neb. promises richly for the city's rapid development.....The Canadian Pacific railway people are engaged in a project to run a chain of ocean cables from Australia to New Zealand, Fiji Islands, Fanning Islands, Sandwich Islands and thence to the city of Vancouver, the terminus of the road..... Snow fell about Asheville N. C., Monday to the depth of 26 inches. The weight of the snow crushed in the roof of the Ashville tobacco works and a large stock of smoking tobacco was ruined. The storm in many parts of Virginia, and indeed in the most of the South was most unusual. Snow fell in many places to the depth of 12 and 18 inches.....Forest fires are sweeping over the entire low region of South Caronina. No rain of any consequence has fallen since July. Dense volumes of smoke almost hide the sun from Charleston. Many of the old plantation mansions have been destroyed. ....Officers of the navy are not particularly pleased with the decision of the Second Comptroller, which holds that travel between the United States and Alaska is foreign travel, and therefore that no mileage can be allowed for it.....At a meeting in Chicago the other night, at which Marshall Field presided, a million and a half dollars were subscribed for a new Opera-house and Exposition Building.... Indiana, Connecticut, New Jersey and West Virginia are following Ohio in the matter of organizing permanent Republican clubs and a State League.

FOREIGN NEWS.

SATURDAY, Dec. 11, 1886.

EUROPE is no nearer a condition of assured peace than it has been for months past. The Bulgarian trouble is apparently as far from settlement as ever. The Turkish government has interceded on behalf of the Mingrelian prince, but its overtures have been repulsed by the Bulgarian Regents, who have declared that they will never consent to his candidacy, though they would be willing to consider the claims of a candidate proposed directly by the Porte. The latest news is that there is to be an offensive and defensive alliance of the Balkan States, Bulgaria, Roumania and Servia. In Germany a fear of war appears to be growing. A meeting of the Frontier Defense Commission was held Saturday, which is represented as in effect a council of war, and which was attended by the Emperor and some of the most eminent military men. On the Berlin Bourse there has been a marked depression and a heavy selling of international securities, principally Russian. This tendency of the market is generally connected with the uneasiness growing out of the political situation. Von Moltke has openly declared in the legislature that Germany needed an increase of the army by 40,000 men, so as to be ready at an early day to fight for the retention of Alsace and Lorraine. The general impression is that war will break out in Spring. All the continental nations are doing their "level best" to be ready for the conflict—by increasing their armies, drilling and organizing troops, and manufacturing the most deadly weapons..... ....In France the Ministry of M. de Freycinet has resigned because the Chamber of Deputies voted for the total abolition of the office of sub-prefect (something like our county sheriffs) contrary to the wishes of the Ministry, which was willing to consent to a partial abolition. There has been difficulty in getting anybody to endeavor to form a ministry, but M. Goblet, the late Minister of Public Instruction, has at length undertaken the task under strong pressure from President Grévy. Boulanger remains Minister of War in the new Cabinet, and is still the popular military hero of the Republic. Since Thiers' time French Cabinets have changed, on an average, every eight months.....In the United Kingdom the great trouble is still in Ireland. Urged by Government a large number of landlords have made voluntary reductions of rent, amounting to from 15 to 50 per cent.; others have done likewise because convinced that the tenants couldn't pay the full amount; and still others have been forced by the National League to make concessions. In case of refusal the League collects what it thinks a fair percentage, and from it supports the tenant in his fight with his landlord—indeed the League is ruling Ireland just now more than the Government. The latter is resolved, however, to suppress the former and inaugurate an era of coercion. Several prominent Leaguers have already been arrested, and are held for trial, and the Government intends to help the landlords to evict tenants who refuse to settle up. To pass laws for this purpose Parliament will assemble next month—a month earlier than usual—and effective but rather arbitrary means will be adopted to do away with obstruction from Irish members and their English, Scotch and Welsh sympathizers. As the Liberal-Unionists are sticking more closely than ever to the Conservatives, the two combined will have such a majority that they can pass what rules and laws they may please.....

AGRICULTURAL NEWS.

SATURDAY, December 11, 1886.

The Chicago live stock Exchange indorses the resolutions passed, the other day, by the National Cattle growers' Convention protesting against the advance in rates on live stock and dressed meat made by the pool railroads running east from Chicago, and begging the railroads to make rates that will not unjustly discriminate against the cattle interests of the West.....A revolution will be effected in the shipment of apples from Nova Scotia by the discovery that large steamers can go up the Bay of Fundy close to the centre of the apple-growing district and load on the spot, thus saving the freight charges by rail..... The cotton yield the last year amounted to 6,387,436 bales.....The tobacco sales for November at Danville, Va. were 1,619,828 pounds at an average of $8 33 per 100. The sales for the corresponding month last year were 3,389,993 pounds..... Several of the companies engaged in importing frozen meat into England are reported to be in a precarious condition financially, owing to the low prices of meat, and some of the foreign shippers are also said to be embarrassed. .....Little demand for hops in Canada, large purchases of foreign stock when cheap, now come into competition with home-grown, causing farmers to sell cheap. ....The frozen meat trade of New Zealand has become an important service to that colony, the exports since January 1 amounting to more than 600,000 carcasses of mutton..... .....Eight proprietors of second-rate hotels and restaurants in Hartford, Conn., were arrested the other day for using oleomargarine on their tables without displaying a placard, "oleomargarine butter," as required by law, under a penalty of $50 fine. These will be regarded as test cases..... A law in South Carolina prohibits any sale, barter or receipt of seed cotton, between sundown and sunrise, as a check upon stealing of cotton by negroes, and yet the Charleston News and Courier says the stealing and unlawful barter of the article is an intolerable nuisance.....Since the oleomargarine law went into effect, the Dairy Commissioner of Connecticut has examined 50 suspected samples, 35 of which proved to be bogus butter. Arrests of sellers of the stuff are very frequent all over the country.....A National Poultry Union has been organized in this city with a capital of $10,000, divided into 1,000 each, and will hold its first exhibition in February next. ....Southern Illinois wheat fields are reported to be infested by clinch-bugs.....Statistician Dodge, of the Agricultural Department, says there are about eighty swine to ever 100 of the population in this country, while in Europe there are only 15 to each 100 persons. .....The National Consumers' Meat Company has leased a portion of the Manhattan Market in this city for a receiving station, and has changed its Western depot from Dakota to Kansas City.....

For an Irritated Throat,
Cough, or Cold, "*Brown's Bronchial Troches*" are offered with the fullest confidence in their efficacy.—*Adv.*

Crops & Markets.

SATURDAY, December 11, 1886.

THE latest reports from the winter wheat sections are uniformly more generally favorable than for a number of years. In Illinois, Ohio, Indiana and Missouri the reports state that the grain is looking unusually good. In Michigan, Wisconsin and Kansas, while the reports are not so favorable, the fields are looking promising. The plant is reported as vigorous and went into Winter in unusually

good shape. Out of 149 principal winter-wheat counties in the States named, 103 report an average or increased acreage as compared with 1885, and 46 report a decreased acreage. Illinois and Kansas indicate the largest decrease. In Ohio only three counties out of 29 show a decrease, and only four in Indiana out of 19 counties reporting. In Illinois 11 counties out of 32 report a decrease, and in Kansas 10 counties out of 21 report a decrease.

A dispatch from Minneapolis, Minn., this morning, says the snow blockade interfered somewhat with the receipts of grain early in the week; but as milder weather has set in receipts are increasing rapidly. Indeed it seems that the transportation and storage facilities are quite inadequate to accommodate all the farmers who wish to push their grain to market. In view of the great amount of grain in the Northwest, and the haste with which holders try to market it, only a very strong demand can keep up present prices, which are about the same as a week ago.

The crop report of the Department of Agriculture, a summary of which has been telegraphed this morning from Washington, says: The December returns of average farm prices by counties, show material reduction as compared with values of the crops in 1885, in wheat, rye and barley. Corn has made an advance nearly equivalent to the percentage of reduction in quantity, and oats, in sympathy with corn rather than the small grains used for human food, average a slightly higher value than last year. The farm values of corn was 33 cents per bushel in December last year. It is now 37 cents. The prices in the surplus States are: Ohio, 35 cents; Indiana, 32; Illinois, 31; Iowa, 30; Missouri, 31; Kansas, 27; Nebraska, 20. The average is 56 cents in New York, 47 in Pennsylvania and 45 in Virginia—two cents lower in each than last year. Prices in the cotton States south and west of North Carolina are higher than last year. South Carolina, 60 cents; Georgia, 60; Alabama, 58; Mississippi, 59; Louisiana, 55; Arkansas, 49; Texas, 60—an increase of 11 cents, due to the disastrous drought. The average December price of wheat is 69 cents, a reduction of eight cents from the average value of the last crop and 4½ cents above the price in 1884. The average in New York is 84 cents; Pennsylvania, 83. The average of Ohio is 74 cents; Michigan, 73; Indiana, 70; Illinois, 69; Wisconsin, 68; Minnesota, 61; Iowa, 60; Missouri, 63; Kansas, 58; Nebraska, 47; Dakota, 52. The average value of oats is 29.9 cents, against 28.5 last December. Rye average 53.1, against 57.9 last year. Barley, 53 cents; last year, 56.3. Buckwheat, 54.4, a reduction of 1.5 cent per bushel. Potatoes 46 cents, one cent higher than December of last year. The value of hay averages nearly eight dollars per ton.

Very moderate offerings of the better qualities of butter, particularly of choice to fancy creamery, enable holders to gain a further advance in values, which closed firmly, with increased interest evinced by local and nearby purchasers for actual distribution. Elgin creameries were notably strong, selling on Thursday up to 30c, at 31c. The less desirable grades were in slack demand and irregular.

	DEC. 10.	DEC. 10, '85.
Creamery, new choice to fancy	27@31c.	29@32c.
State, new dairy fancy	25@28	21@2[illegible]

Strictly choice to fancy cheese again ruled strong, during the past week, holders handling supplies carefully and showing no urgency in their offerings, awaiting the actual requirements of buyers. Shippers buy sparingly. Desirable lots of medium quality are represented as very difficult to procure. Ocean freights rates strong and extreme.

	DEC. 10.	DEC. 10, '85
New cheese (f'cy)	12¼@13	9@9¼

The Utica Dairymen's Board of Trade report that the cheese market has been an improvement over 1885, although opening May 3, two weeks later than last year. Factories are all closed. The lowest price of the season was 6¼ cts. (June 13) and the highest .12¼, which was paid on three of the four market days in November. There have been sold on the Utica market during this season 325,962 boxes of cheese or 19,557,720 pounds. The average price for the season was .0907, giving a money value of $1,7.3,885.20. In quantity the make of last year has been exceeded by 5,163 boxes, and in value received by $242,-125.90. The transactions of 1886 have been the largest in the history of the Utica market, though the value of the cheese sold was greater in 1884 by $215,000. The sales on the Little Falls market are 209,135 boxes, or 12,-548,100 pounds. The average price there was .0908, making the value of the cheese sold $1,139,367.48, against $990,6.6.08 last year. The value of the cheese sold on the two markets was $2,913,252.68, against $2,521,706.28 in 1885, a betterment of $391,48 .40.

The past week has been favorable in weather for marketing and slaughtering hogs, and packing operations have been active, exceeding the corresponding time last year. At the ten leading points in the West the total packing for the week has been 590,000 hogs, against 505,000 the preceding week, and 465,000 for corresponding week last year, according to the Cincinnati Price Current. These places show a total of 2,035,000 hogs since November 1, against 2,215,000 last year—a decrease of 180,000.

The latest advices from the London wool sales show a better feeling in that market, and the American dealers manifest increased confidence. It appears that the wools offered at the beginning of the sales were in great measure inferior. On more desirable descriptions the values of the October series seem to have been pretty much sustained. At Boston prices, as a whole, are rather firmer than a week ago. The market presents no special feature either of strength or weakness. Current quotations for leading sorts in comparison with last year are as follows:

	Dec. 11, '85.	Dec. 10, 86.
Ohio & Penn. X	32@33c.	34@35c.
Ohio & Penn. XX	34@35	36
Ohio & Penn. XX and above	35@37	36½@37½
Michigan X	30@31	32@33
Fine Ohio delaines	36@37	37@38
No. 1 combing	37@38	39@41
Texas spring, 12 months	22@25	23@26
Super A	33@37	33@37

The sales of the week at Boston are reported at 2,827,000 pounds, as against 2,423,000 pounds last week, and 2,851,000 in the corresponding week last year. The wool trade at Philadelphia has developed no improvement. Manufacturers are indifferent about operating beyond actual wants unless they can secure a cut of 1 to 2c. under ruling prices, and holders are not inclined to accept business on this basis.

MARKETS BY TELEGRAPH.

SATURDAY, December 11, 1886

CHICAGO.—Compared with cash prices a week ago, No. 2 Spring Wheat is ½c. higher. No. 3 Spring ¾c. higher, No. 2 Red, unchanged Corn, ¼c. lower. Oats, ⅜c. lower. Flaxseed, 2¼c. higher. Pork, 30c. higher. Cattle, a trifle lower. Hogs, somewhat higher. Sheep, 10 to 20c. higher.

PRODUCE COMMISSION HOUSE
ESTABLISHED 1865.
S. H. & E. H. FROST,
100 PARK PLACE, N. Y.
Shippers desiring to favor us will be furnished stencils, shipping cards, etc., on application. Promptness guaranteed. References, RURAL NEW-YORKER, Irving National Bank, etc.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

I WILL INSURE YOUR HOGS!
DR. JOS. HAAS'
HOG AND POULTRY REMEDY

[None Genuine without this Trade Mark.]
Is the only Practical Preventive of the so-called Swine Plague.

If used in proper quantities, it will
1. *Prevent Disease;*
2. *Arrest Disease;*
3. *Pay for itself with the increased pork it will put upon the hogs.*

AS AN EVIDENCE OF FAITH
in my Remedy, I make the following offer:
I will insure herds of swine of not less than one hundred in number against disease, at a small fee per head, provided they are fed my Remedy under my direction, and prove upon examination prior to contract that they are in a healthy condition, and neither inbred, close-bred, or the progeny of such.

WHAT IS SAID OF THE REMEDY.
"It has stopped the hogs dying and improved their appetite."—F. C. GOLDSBOROUGH, Easton, Md.
"Have used the remedy with success."—D. G. BARBER, Easton, Md.
This medicine has been thoroughly tested and its merits established on the eastern shore."—Record and Gazette, Pocomoke, Md.
"I will not be without Haas's Hog Remedy if it costs three times the present price."—JOHN CASTIN, Grant City, Mo.
"We would not risk feeding a pen of hogs without the remedy."—WHITE & CO., Gibsonton, Pa.
"I would not think of raising hogs without it."—J. M. ELLSWORTH, Martinsville, Wis.
"It gives satisfaction every time."—J. G. BARTLETT & SON, Suncook, N. H.
"It has never failed to arrest the disease yet."—JONES & MOSSELMAN, St Paris, O.
"I have sold over $2,000 worth, and am pleased to say that it has given good satisfaction."—MELLE WILLIAMS, Druggist, Taylorville, Ill.
The Remedy can be procured of all druggists, or from my Laboratory, upon receipt of price.
Prices, **$2.50, $1.25,** and **50 cents** per package. 25 pound cans, **$12.50.**

Law.

HERE are some recent local discussions of interest to farmers:

ELECTION BET.—Two persons made a bet upon an election, each placing his check upon the same bank in the stakeholder's hands. The one in whose favor the bet was decided took the other's check to the bank and had it cashed. The Court of Appeals of Texas held (Donnelley *vs.* Citizens' Bank) that the bank could not recover from the latter the money so paid out.

GARNISHMENT.—The wages of a clerk and bookkeeper are not subject to garnishment in Georgia, according to the decision of the Supreme Court of that State in the case of Lamar *vs.* Chisholm.

STATUTE OF LIMITATIONS.—According to the decision of the Supreme Court of Indiana in the case of Wood *et al. vs.* Bissell, where a contract is made in Indiana with a non-resident, and such person continues to be a non-resident, the statute of limitations will not run as to him.

AGREEMENT TO SHARE PROFIT OR LOSS.—In the case of Clark *vs.* Ware *et al.*, the Superior Court of Kentucky held that a contract whereby the parties agreed to buy tobacco on joint account and to share equally the profit or loss, one of them undertaking to advance the money required and the other undertaking to perform personal service in buying, prizing and shipping the tobacco, constituted a partnership.

ASSESSMENT FOR TAXES.—Where land which was a part of the right of way of a railroad was used for side tracks, and built thereon a round-house, repair shop, wood-shed and water-tank, the Supreme Court of Indiana held that such right of way, together with all the superstructure and tracks thereon, constituted "railroad track," which was to be valued and assessed by the State Board of Equalization and not by the local authorities. Pfaff *et al. vs.* The Terre Haute & Indianapolis Railroad Company.

NAVIGABLE WATER-COURSE —The Supreme Court of Louisiana held, in the case of Goodwill *et al vs.* Police Jury of Bossier Parish, that a water-course is a navigable stream when in its natural state it is such as to afford a channel for useful commerce, and that that condition is not affected by the formation thereon of natural barriers resulting from sand-bars or rafts formed by accumulation of timber.

FENCING RAILROADS.—The Supreme Court of Minnesota lately held (Emmons *vs.* Minneapolis & St. Louis Railroad Company) that a statute requiring railroad companies to fence their roads and making them liable in damages for a failure to comply with the terms of the statute was within the police power of the State. The court said: To regulate the carrying on of any business liable to be injurious to the property of others, like that of operating a railroad, so that it shall do the least possible injury to such property, is as much within the police power of the State as regulating it with a view to protect life from its dangers. There can be no doubt that the State may, under that power, require railroads to be so constructed, maintained and operated, or so protected or inclosed, that they will injure as little as possible the farms or lands through or alongside of which they run.

R. H., Hoboken, N. J.—What are the main points of the "new law" of New Jersey touching on arrears of taxes? And how early after purchase at tax sale will the buyer's title become absolute?

ANS.—The new law permits the payment of all arrears of taxes in incorporated cities, due prior to 1885, at the original amount, seven per cent. interest and expenses, in all cases where the property has not been sold or bought in by the city. The period allowed for redemption by the owner, mortgage or the person entitled, is still two years after the sale, except that when the tax title is held by the township, the redemption may be made afterward, on paying all interest, charges, etc., including taxes subsequently due. The buyer's title becomes absolute in two years after the sale.

L. N. G., Albany, N. Y.—A grocer was selling butterine; a charge is made against him for selling it for butter, but the clerk sold it. Can the clerk be held too; if so, what relation has the clerk to the charge, and what can be done with him?

ANS.—The State law prohibiting the manufacture and sale of oleomargarine enacts that "if any person shall suffer any violation of the provision of this act by his agent, servant, or in any room or building occupied or controlled by him, he shall be deemed a principal in such violation and punished accordingly. (Chapter 183, section 17, laws of 1885.) The clerk is also liable to punishment.

"STOP MY PAPER"

Means nothing at the FARMER'S HOME office, unless it is accompanied with the cash to pay arrearages. We can not stop your paper unless you pay up to date. Refusing to take your paper out of the office does not help it unless you have paid up The law holds you for every cent. Some very bright (?) people send us their paper back with a two-cent stamp on. Well, we get the paper of course, but the waste basket gets it too. Your name on the paper, without your post-office address is useless. How do we know where to find John Vonfelnklesteinkopsudledock on our list unless we have the post-office. We send papers to two thousand post-offices and twenty thousand people. A little admixture of tincture of common sense would do some people good.

The above threatening printed slip was sent out by the Farmer's Home, published at Dayton, Ohio, to a friend of ours who had received a number of copies of the paper through the mails without having ever ordered it. A dunning letter together with a bill for two months' subscription to the paper, was sent at the same time. No charge can be legally collected for any publication sent to any address unless an order has been given for it by the party to whom it has been sent.

About two years ago we exposed a fraud of some Cuban sharpers and once more, a year ago, repeated the exposure, as they were repeating the same "game." Then they swindled some Philadelphians out of a considerable sum, and there is little doubt that they have found many other dupes also. The other day a resident of Birmingham, Mich., received a letter written in Spanish and bearing the Havana postmark. The writer said that he was formerly a high official in the Cuban government service. He absconded to the United States several months ago with $360,000 in Spanish bonds. He exchanged these bonds at New Orleans for United States securities, and with the securities on his person made a trip through the States, going as far north as Michigan. Becoming suspicious that he was being shadowed, he buried his wealth in the vicinity of Birmingham, Mich.. He then returned to the South and at Key West was kidnapped, taken to Havana and thrown into the government prison. The writer went on to say that he was still in prison. He had heard, while in Birmingham, of the high standing of the man he was addressing, and he offered to give him one-third of the securities if he would interest himself in securing the writer's release. Before anything could be done, however, it was necessary to negotiate some of the securities. A plan of the locality where they were buried was among his baggage, which was detained by the Havana police, and $1,500 was needed to release it. If the Birmingham business man would send the money the plan would be mailed to him. Several of the people in the same State have received similar letters. The men singled out by the sharpers are all rich. It is not known whether any of them bit. The money secured will of course be always a dead loss.

A GREAT splndge is now being made by that "Harlem Commou Syndicate," or rather by lawyer Walter H. Shupe, its lond voiced month-piece and originator; but instead of turning out the residents of the lands it claims, it has been decided by "the trustees of the Syndicate," that while the Harlem householders have no legal right to the property, which belongs to the Coovert or (Covert) heirs, still they have moral rights which should not be disregarded: if they will turn in, therefore, and form a company to build docks on the Harlem, the real owners of their homesteads will leave them in peace. All this is arrant nousense, of course. It is humiliating to think that there are people in Pittsburg where the chief Covert claimant—a clergyman—lives and elsewhere, perhaps, who will be inclined to take Shupe's report seriously. Shupe has, of course, levied contributions on all the claimants—and it is said there are over 800 of them—so that anyhow he finds it a good thing.

TO SEVERAL INQUIRERS.—From all we can learn the "deafness cure" advertised by T. S. Page, of this city is effective in relieving or curing deafness in some cases, and of little or no use in others. Everything depends on the cause, nature and extent of the evil. There is no such thing as a "cure" for all forms of the ailment; and many cases cannot possibly be cured by any form of treatment. The Page "cure" is not a humbug—that is all we can say of it.... We do not recommend the Damon Chemical Works, New Bedford, Mass ...The "Free Currant" advertised by Lomax, Indiana, is a humbug—no doubt whatever about it,

Miscellaneous.

SOCIETY NOTES.

THE WESTERN NEW YORK HORTICULTURAL SOCIETY will hold its 22d annual meeting at Rochester, N. Y., Jan. 26 The meetings of this society are famous in horticultural annals. Papers will be presented by J. J. Thomas, Dr. Sturtevant, Chas. A. Green, Dr. Lintner, E. S. Goff and others. A list of 25 suggestive questions has been prepared as a means of bringing out a discussion. P. C. Reynolds, Rochester, N. Y., Secretary.

BEEKEEPERS will meet at Albany, Jan. 18-20. The meeting promises to be a grand one. Delegates from the New York State, the Eastern N. Y., the New Jersey and Eastern Beekeepers' Associations will unite. Essays, discussions and exhibitions of apiarian supplies will be the features of this meeting.

ONE feature of the meeting of the Connecticut State Grange, held at Hartford, Dec. 7-9, was the open meeting. The programme called for "A good word from each Grange; time—five or six minutes." Last year it took 10 to 15 minutes for each of these "Good words." The hope is by careful training to so breed brevity into the speakers that this exercise can be done in 2:30.

THE OHIO STATE HORTICULTURAL SOCIETY meets this year at Dayton, O., Dec. 15-17. This is the 20th annual meeting. A fine programme—its length is the only thing about it we could criticise—has been arranged. Those who attend will learn volumes about fruits.

CATALOGUES, ETC., RECEIVED.

EASTMAN BUSINESS COLLEGE.—Catalogue from the president of this institution, Poughkeepsie, N. Y.—This is one of the best advertising pamphlets we have ever examined. It gives a history of the school, illustrates its more prominent features and plainly shows what is to be gained by a course within its walls. It is the strongest argument for a careful training in business life that can be imagined. And the school is worthy of such an advertisement—that is the best compliment we can give it. The one thing lacking in the lives of thousands of men is the utter lack of a definite system in their business transactions. A business that might be made to yield a good profit frequently fails to do more than yield a bare living, simply because it is conducted on wrong business principles. A careful training in business habits would have made all the difference between profit and loss. Farmers and farmers' boys need this careful training. They can obtain it cheaply and readily at the Eastman College. Those who examine this catalogue will be more than repaid.

HELIOTYPE ENGRAVINGS.—Catalogue from the Heliotype Printing Co., 211 Tremont St., Boston, Mass.—We are glad to call the attention of our readers to these beautiful pictures. Nothing could be finer for a cheap and yet attractive Christmas present. Too many of our homes are filled with poor chromos or coarse engravings. A good picture is a teacher. It adds to the home. It teaches beauty and grace and cultivates all the finer feelings. The soul of a true artist looks out from his work. The heliotype process brings the work of the greatest artists that have ever lived within reach of those who could hardly afford to look at the original pictures. The heliotype is practically a printed photograph. Every line and every dot of the original high-priced engravings are carefully reproduced and printed in permanent ink. Is a good picture better than a poor one? Is a heliotype superior to a chromo? Is the work of a master better than that of an apprentice? The catalogue is very neatly arranged and most admirably illustrates and describes these engravings. We invite our friends to enclose a stamp for it.

FOLDING SAWING MACHINE. — Pamphlet from the Sawing Machine Co., 303-311 Canal Street, Chicago, Ill.—This new tool is said to work well. It weighs 41 pounds and can be completely folded up. It is claimed that one man can carry it on his shoulder, saw down his timber alone, and saw it up into logs or bolts. It can be adjusted with ease to the ground, so that it makes no difference how rough the ground may be. All the points claimed for the machine are described in the pamphlet. An unusually large number of testimonials are given. If this saw will really do what is claimed, it should have a wonderful sale. The catalogue is well worth looking over.

THE KING OF PORTABLE MILLS.—Catalogue from Chas. Kaestner & Co., 74-86 W. Harrison Street, Chicago, Ill.—This pamphlet undertakes to show why these mills are worthy of their name and superior to all others for rapidity of grinding, ease of motion, durability and simplicity.

HIGGANUM M'F'G CORPORATION, Higganum, Conn.—A beautifully illustrated calander which would ornament a store or post-office. Send for one.

Rheumatism

We doubt if there is, or can be, a specific remedy for rheumatism; but thousands who have suffered its pains have been greatly benefited by Hood's Sarsaparilla. If you have failed to find relief, try this great remedy. It corrects the acidity of the blood which is the cause of the disease, and builds up the whole system.

"I was afflicted with rheumatism twenty years. Previous to 1883 I found no relief, but grew worse, until I was almost helpless. Hood's Sarsaparilla did me more good than all the other medicine I ever had." H. T. BALCOM, Shirley Village, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

CHOICE ENGRAVINGS

Beautiful HELIOTYPE ENGRAVINGS, carefully chosen and finely finished, and admirably suited to the decoration of rooms when neatly framed; also, for Portfolios and Art Studies. They include many of the finest works of the Great Modern Artists, such as Millet, Gabriel Max, Burne-Jones, Paul Thumann, Millais, Leighton, Landseer, Rosa Bonheur, George Mason, Frederick Walker and others.

They are printed in permanent ink, on heavy plate paper, 22x28 inches in size, with engraved title and India tint, and are sold at

One Dollar each.

Sent, post-paid, to any address, securely wrapped, upon receipt of price.

An Illustrated Catalogue mailed upon receipt of stamp.

PERSONALS.

JOHN E. OWENS, the veteran comedian, died at his Baltimore home Tuesday, aged 63.

THE late Congressman Price—or "Bill" Price, as a great many familiar friends called him—"rafted" logs and drove oxen in Northern Wisconsin thirty years ago.

THE little daughter of Senator and Mrs. Van Wyck, now three or four years old, has an odd name—Happy-New-Year Van Wyck. She was born on the first day of the year.

MRS. CLEVELAND is a daily visitor at Oak View, near Washington, where her mother now resides, and between which and the White House there is telephonic communication.

MRS. CLEVELAND expresses her entire approval of the movement for the abolition of the feminine hat in the theatre, and says that she will be among the first to observe "a usage that unites good sense and good *ton*."

"COUSIN BEN" FOLSOM, the new Consul at Sheffield (when he gets there), is spoken of as a nice young man with a soft, brown beard and mustache, and a dove-like, hazel eye. His dress shows a tendency towards dudishness.

MRS. ELIZA WILCOX, the child of an adopted son of President Jackson, is now a clerk in the Treasury Department. She was born in the White House, and was a baby when the Treasury Department building was dedicated. A lock of her hair was placed in the cornerstone.

UBEZIAH SLAYTON, of Fayette County, Ga., is the father of so many children that he cannot remember their names. He has been married twice and had eighteen children by one wife and twelve by the other. He had five sons in one company of a Georgia regiment during the war.

CONGRESSMAN McKinley, of Ohio, quotes Congressman Hewitt as saying that "there never was a President who had such a double-riveted title as Hayes—not merely the title of an election, but the title of having had that election examined judicially and then awarded to him." McKinley was an officer in Hayes's regiment during the war.

GOVERNOR SEAY, of Alabama, is getting much sharp criticism from the Southern press for saying, in his inaugural address, that he "questioned the wisdom of erecting monuments in commemoration of civil strife," and "emphatically opposed any expenditure by the State for a monument to the dead until the wants of the needy survivors should be cared for."

CHIEF-JUSTICE WAITE of the United States Supreme Court reached his 70th birthday last Monday, and is now eligible for retirement upon a pension of $10,000 a year. He is still vigorous, however, with no apparent intention of retiring. Justices Field, Miller and Bradley are also eligible for retirement upon full pay, but none has expressed a desire to leave the bench.

COL. JOHN S. MOSBY has in his possession the last letter of Gen. Grant. It was dictated the day before he died, and was addressed to Gov. Stanford, asking his influence to secure Col. Mosby a position in California which would help him to enter on the practice of law. This letter was the means of obtaining an appointment as counsel for the Southern Pacific Railroad, which Mosby still holds.

THE late John E. Owens, the actor, sympathized with the South during the war, but was one of the first men in Baltimore to be drafted for service in the Union army. He was appearing in Washington, when a telegraph notified him of this fact. His part that night was an old man's. Turning to the audience on the opening of the act following when he received the notice, he drew his coat tightly around him and got off the pun: "There's a draft around here, but it ain't from the right side."

THE West once furnished two Senators in Congress who were father and son—Senator Dodge of Wisconsin and his son, Senator Dodge of Iowa, serving at the same time. Simon Cameron stepped out of his seat in the Senate to permit his son Don to step in, and three generations of Bayards have served consecutively in the Senate. To-day Senator Voorhees is in the Senate chamber, and his son in the House as a delegate from Washington Territory.

Miscellaneous Advertising.

A Deep Mystery.

Wherever you are located you should write to Hallett & Co., Portland, Maine, and receive free, full information about work that you can do and live at home, making thereby from $5 to $25 and upwards daily. Some have made over $50 in a day. All is new. Hallett & Co. will start you. Capital not needed. Either sex. All ages. No class of working people have ever made money so fast heretofore. Comfortable fortunes await every worker. All this seems a deep mystery to you, reader, but send along your address and it will be cleared up and proved. Better not delay; now is the time.

Humorous.

THE CHESTNUT BELLS,

BY YAWCOB STRAUSS.

SEE dot feller mit' oxe bells—
  Shestnud bells!
More as feefty, seexty dozens
  Efry day he sells.
How dhey shtingle, shingle, shingle,
  Efry day und efry night,
  Vhile der cars off efry single
Shtory-deller seems to tingle
  Mit gontusions und affright.

"Shust a dime, dime, dime,"
  Sings dot feller, keeping time
To der "tin-tin-appligations" vhich dot
  Ravin' boet dells
Of der bells, bells, bells, bells,
  Bells, bells, bells—
Vrom der shingling und der tinkling
  Off der bells.

Dake a lesson vrom dhose bells—
  Shestnud bells!
Look und see how efry passer
  Quickly oudt hees money "shells!"
Und der bells dhey tinkle, tinkle,
  In der house und in der shtore;
Vhile mit shmiles der faces wrinkle
  At der shtories Rip Van Winkle
Heard aboudt in days off yore.

Und dhey ring, ring, ring,
  All der times like anyding,
At dhose altogedher brevious shestnuds
  Each von tells.
Oh, der bells, bells, bells, bells,
  Bells, bells, bells—
Dhere vas blendy, blendy vork
  For shestnud bells.

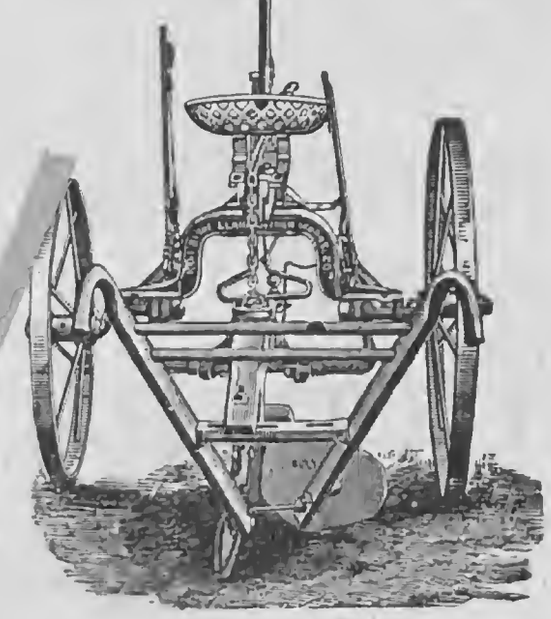
AGENTS WANTED.

Will wash Cleaner, Easier, and with Less Injury to Clothes than any other in the World. We challenge any manufacturer to produce a better Washer. Every Machine Warranted FIVE Years, and Satisfaction Guaranteed. The only Washer that can be clamped to any sized tub like a Wringer. Made of malleable iron, galvanized, and will outlast any two wooden machines. Agents wanted. Exclusive Territory. Our agents all over the country are making from $75 to $200 per month. Retail price, $7. Sample to agents, $3. Also our celebrated
KEYSTONE WRINGERS AT LOWEST WHOLESALE PRICES.
Circulars Free. Refer to editor of this paper. Address F. F. ADAMS & CO., Erie, Pa.

THE ELKHART PLOW SULKY



READ THESE FACTS.
Lighter Draft with Driver Riding than ordinary Plow with Driver Walking. Turns square corner without backing. It is wholly constructed of Iron except tongue and front lever.
We claim and GUARANTEE that a Plow attached to the Sulky and carrying the driver, is from five to 100 pounds lighter draft than the same Plow doing same work without the Sulky. Write for prices.
ELKHART IRON WORKS,
ELKHART, IND.
Mention Rural New-Yorker.

$65 A MONTH and BOARD for Three live Young Men or Ladies in each county. P. W. ZIEGLER & CO. PHILADELPHIA.

AGENTS WANTED
Brown's Fence Builder.
A practical, simple, durable, portable, cheap and valuable FARM IMPLEMENT for building picket fence on the posts where it is to remain. Heavy wire and strong, heavy pickets used, easily operated by a 16-year old boy. Sixty rods made in a day at a cost of 30 cents a rod. Agents wanted.

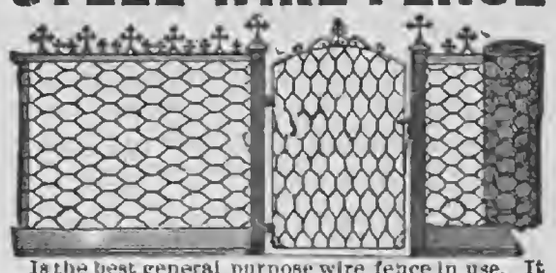
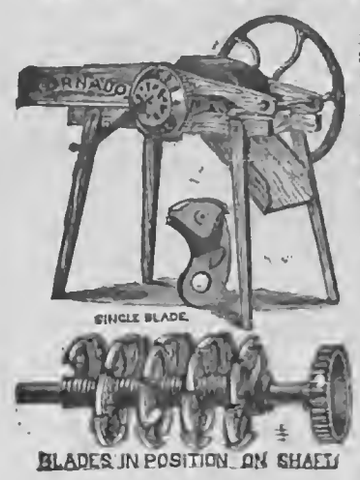
The Cold-Water Dip,
(THYMO-CRESOL,)
A very highly concentrated, non-poisonous fluid—mixes readily with cold or warm water—the simplest, safest, surest cure for TICKS,
LICE,
MANGE, SCAB, all Insect Pests, all Skin troubles, and many other Diseases of Live Stock. Recommended by many prominent Breeders. See circular, sent on application. T. W. LAWFORD & CO., Baltimore, Md.

SEDGWICK STEEL WIRE FENCE



Is the best general purpose wire fence in use. It **is a strong net-work without barbs.** Don't injure stock. It will turn dogs, pigs, sheep and poultry, as well as horses and cattle. The best fence for Farms, Gardens, Stock Ranges and Railroads. Very neat, pretty styles for Lawns, Parks, School-lots and Cemeteries. Covered with rust-proof paint, or made of galvanized wire, as preferred. It will last a life-time. It is **better than boards or barbed wire** in every respect. The **Sedgwick Gates** made of wrought-iron pipe and steel wire, defy all competition in lightness, neatness, strength and durability. We make the best, cheapest and easiest working **all-iron automatic or self-opening gate,** and the **neatest cheap iron fences now made.** The **best Wire Stretchers, Cutting Pliers and Post Augers.** For prices and particulars ask Hardware Dealers, or address, mentioning paper.
SEDGWICK BROS., Richmond, Ind.
EDWARD SUTTON, Eastern Agent, 300 Market St., Philadelphia, Pa.

The TORNADO Feed Cutter



A new invention for cutting hay, straw, sheaf oats, ensilage, and thoroughly cutting and splitting corn fodder, either **husked or unhusked.** Cuts on an entirely **new principle.** Not liable to get out of order. **Will cut faster with less power** than any other cutter. Has been thoroughly tested and found perfect in every respect. Farmers, Dairymen, Liverymen, and Stock-feeders can save **money, time,** and **labor** by using a **Tornado Cutter.** Made in sizes to suit everybody. Every machine warranted to give satisfaction. Responsible agents wanted in unoccupied territory. Write for prices and circulars giving full particulars.
W. R. HARRISON & CO., Mfrs., Canton, Ohio, U. S. A.

HORSE POWERS.
Latest Improvement.
Machines for **Threshing** and **Cleaning Grain;** also Machines for **Sawing Wood** with Circular and Cross-Cut Drag Saws.
Acknowledged by all to be **THE BEST,** considering Easy Draft, Durability, Quantity and Quality of Work. 48-page Pamphlet FREE. Address

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XLV. No. 1926. NEW YORK, DECEMBER 25, 1886. PRICE FIVE CENTS. $2.00 PER YEAR.

Entered, according to Act of Congress, in the year 1886, by the RURAL NEW-YORKER, in the office of the Librarian of Congress at Washington.

The Swineherd.

WINTER TREATMENT OF SWINE.

A. B. ALLEN.

GENERAL DIRECTIONS.—The best food for swine after half to full growth, with the exception of breeding sows, is a mixture of Indian meal, oat meal and wheat bran, in equal proportions, with a pint to a quart of oil or cotton-seed meal added to every four quarts of the above. Dissolve an even tablespoonful of fine salt in warm water enough to make a thick gruel of this provender, and feed regularly morning, noon and night, sufficient to keep the stock in good condition, avoiding the extremes of over fat or lean. One week add a gill of clean wood ashes to this ration, and the next week, a tablespoonful of fine sulphur, and so alternate weekly. These and salt help to keep off cholera and other ailments. Water regularly either before or after feeding—the former is best—and see that this is also warm. Food with drink given warm assists the digestion much better than if cold, and enables it to go farther in support of all kinds of domestic animals. Late experiments in feeding cooked food instead of raw prove that there is no economy in it; the trouble and expense then of doing this may be avoided.

Instead of oat meal with the Indian meal, barley, rye, wheat, or buckwheat may be substituted, most valuable in the order here stated; or, in some instances, wheat is considered superior to rye. Pea and bean meal may also be substituted, but never having fed them to swine, I do not know the exact proportion to add of both or each to Indian or other meal to make the best provender. This can be ascertained only by careful experiments. Either of the above sorts, if preferred, can be ground with the corn, half and half, and if oil or cotton-seed meal is not to be had, flax seed or hulled cotton seed may also be ground with them in the requisite proportion. Then take two parts of this provender and mix it with one part of wheat bran for feeding the swine.

If they are confined in pens or yards, some charcoal, or hard, or bituminous coal cinders and ashes, or a chunk of rotton wood to gnaw is necessary to keep them in good health and condition. Hay, of which clover is much the best, may be chopped up in the straw cutter into pieces of an inch or less in length; then soaked a little in warm water, and fed as much as the animals will eat at noon or night. Raw roots, and pumpkins in moderate quantity also can be profitably fed at noon. They should never be frozen, but must be taken from a warm cellar or pit, cut into suitable pieces to be easily seized by the mouth, and placed in troughs, or on hard, dry, grassy ground. Wet or soft ground should be avoided on which to scatter these for eating. The best roots I have used for this purpose are sugar beets, carrots, parsnips, mangels and swedes, preferred in the order here named. Potatoes are better than either of these if newly and properly boiled, and the water poured off so as to leave them to dry a while. Mash them and salt as if for one's-self. Raw potatoes are apt to scour the swine, and I have found them quite unprofitable for their sustenance.

FEED OF SOWS.—If a good improved breed when pregnant, special care must be taken to prevent them from getting too fat, especially if confined in a pen where they cannot have sufficient exercise. If over-fat, they are likely to become barren or give birth to small or weakly pigs, or are liable to overlie and smother them, or tread on and wound, or even kill the little litter till some weeks old. I have wintered breeding sows on raw pumpkins when the weather was mild, and changed to roots as it grew colder, with a mess of wheat bran and a pint of oat meal at night, and they kept in just the right condition. Their flesh was looser and softer than when fed on grain, and they were quicker and more active in movement, and, what is very desirable, they never manifested any desire to then devour their offspring, this ration keeping their appetite from becoming morbid and unnatural. A few weeks before farrowing, each sow should be put in a warm pen by herself and then she will give birth to her young much more safely.

PIGS—Make, in the dam's pen, a partition large enough to accommodate the litter inside of it, of strong upright slats, wide enough apart for them to run through; place a small trough here, and as soon as they will eat oats or take other grain put all in it which they will consume through the day. The sow thus cannot rob them of their ration, and by having it always at command they do not pull so hard upon her, and still they get food enough to keep them growing well. After weaning—say when two months old—feed them provender the same as directed above for grown swine, and if this can be made into a gruel with some skim-milk or buttermilk instead of water, it will assist them to thrive all the faster. If they commence scouring at any time, or even get somewhat loose, stop their gruel instantly and feed them dry oats or other grain till this ceases. Wheat flour fed dry is also excellent to stop scouring. In weaning pigs place them in a warm pen some little distance from their dam, and then they will not worry to get to her. If vigorous and of equal size 10 or 12 may be penned together; if not, then fewer, as the larger ones are liable to overlie the smaller as they huddle together to sleep, and thus smother them. Too many half to full-grown swine herding in pens, sheds or yards, are liable to the same casualty.

SHELTER.—If warmly sheltered, swine will grow or fatten much faster on the same quantity of food than if exposed to the weather, so that, generally speaking, unless they have thick woods bedded with abundant leaves to retire to for protection, it is a matter of economy to house them in a warm piggery, or at least in a tight shed opening only to the south; and this should have a board floor, and the yard surrounding it should be so well bedded with leaves, straw, or coarse hay, as to keep their feet out of mud. Wet feet are almost as hurtful to animal comfort and thrift as a wet body. If penned a yard should be attached to each with a door to pass out and in for exercise at pleasure, except at night or in very cold or stormy weather; then it is best also to confine them closely. Proper shelter will not only keep the animals in better condition and guard them from disease, but will also greatly economize feed.

THE BOAR ought to be always kept in a pen by himself with a small yard in the rear for him to exercise as he may desire. If suffered to run with the other swine he might injure them badly. Boars, like bulls, are of uncertain temper, and they must be kept where they can do no harm. Their feed may be the same as that of others, but be careful that they do not become too fat, otherwise they would be inefficient for service, and their offspring, if got, will come weakly, and grow up slowly and with little constitution.

BREEDS.—As to these, keep none but the improved sorts, for they will make thrice as much meat on the same quantity of food as a land-pike or razor-back, and this meat will be of a far better quality. Again, the improved kind must be chosen for what is wanted, as some are better than others to make superior fat pork for salting and barreling, and others excel in their hams, shoulders, and sides for smoking.

The Herdsman.

DEHORNING CATTLE.

IN the RURAL for Oct. 30, in advocating my practice of dehorning cattle, I said that I knew there was a point where the horn could be cut so that a stub would grow, and another where a stub would not grow, and where the pain and bleeding would be but little. I then said "cut the horn above this point and the animal will bleed till it falls." Mr. Henry Stewart, Nov. 27, page 790, says of me:

"When he writes as he does so incorrectly about horns, intelligent persons will lose confidence in his judgment. Any book on anatomy gives a clear description of the horn of an ox, and shows that the inner core of the horn is a continuation of the frontal sinus, and is lined with the periosteum, a most sensitive membrane and full of nerves and blood-vessels. Further, when he says if the horn is cut above a certain point the animal will bleed to death, but will not if cut lower down, he states an absurdity, for there can be no blood above a point if there is no artery below it."

I am willing to be criticized, but my critic must not put words into my mouth that I did not say. I never said a word about the animal's "dying;" but I insist upon it that I was right in what I did say. Mr. Stewart ought to know what he is writing about, but what facts can he give? Has he ever seen an animal dehorned to know how cruel the operation is? This season one of my neighbors cut the horns off a two-year-old bull so as to leave stubs an inch long. The bull bled until he fell. The hemorrhage was stopped with difficulty; but the bull was unable to move for some time. About the same time another neighbor brought a two-year-old bull to my place, and I dehorned him. He did not bleed a spoonful, and as soon as he was turned into the yard within one minute after the operation he served a cow. He went to eating in five minutes and did not lose a meal thereafter. Several gentlemen were present who will verify these statements. Shortly after two herds of cattle were driven up to my place and dehorned. Not a quart of blood was shed from 60 cattle. Now these are facts which can be proved by good men and true. It is time for Mr. Stewart to stop guessing and state facts in return. I have hundreds of letters from those who have practiced dehorning, and any one of them would disprove the charge of cruelty.

Now a word about the horn. It is composed of five parts, two sensitive and three devoid of feeling. The matrix at the base of the horn, a fleshy part, is sensitive like any other skin and no more and no less, so far as we know. The periosteum which grows from the matrix and which is an extension of the corium or true skin, is a thin membrane and is sensitive, but is not, as experience shows by oft repeated experiments, as sensitive as ordinary skin, or even so much as the matrix itself. In old cattle this periosteum grows very thin and often dies altogether either from old age or freezing in winter or because the shell is knocked off and it cannot live. The periosteum is wrapped around the third part of the horn, which is called the bone horn. This bone horn was without feeling always. It was cartilage originally and cartilage, like bone, has no feeling. The fourth part of the horn is the shell, which all know is not sensitive. Now there remains the fifth part. It is the hole inside. All bone horns are hollow and so we say all cattle horns are hollow. Now at a certain veterinary convention I was called upon to speak on horns, and in telling of a certain unreasonable person who denounced me as false and cruel and all that, I went on to say he had so utterly failed in his fight over this matter, that he looked sheepish enough to crawl into one of those holes, and one of the veterinarians said: "Yes, and he ought to pull the hole in after him."

I should have also stated there is no core to the horn in the sense implied by Mr. S. Neither is it true that the "periosteum is the lining of the core," that is, unless they wear the linings outside in Mr. Stewart's country.

Henry Co., Ill. H. H. HAAFF.

The Poultry Yard.

BREEDING FOR THE BEST RESULTS.

IN a recent issue of the RURAL NEW-YORKER the suggestion was made that the most productive hens should be selected from which to secure the succeeding stock. There have been many difficulties in the way of so doing in the past, but a few enterprising poultrymen are attempting some reforms in that direction, and, strange to say, the most vigorous opposition comes from the breeders of the pure breeds. The principal points allowed in the Standard are for the useless portions of a fowl, so far as table purposes are concerned. The Black Spanish points are so arranged that in a possible 100, the head and face get 10 points, the comb 10 the earlobes and wattle 10 and the neck 8—or one-third the whole for head and neck. Then 19 more points are given for the wings, legs, toes, and tail. It can be easily seen that if 30 points in 100 are given to the head, the breeder who desires to secure a high score at the fairs will breed for the best white face, clear earlobes and straight comb, as he has a chance of deriving a great number of points for the head, even if he has to sacrifice the breast and body to do so. In this manner the Black Spanish have been so bred as to lose many of their excellent qualities. They have perfect *heads* (in a showroom sense), but are lacking in stamina and vigor. Nor is this breed an exception.

But the selection of eggs from the best laying hens, though assisting in improvement, will not accomplish the object. Something depends on the cock. The breed must be pure or it will fail to satisfy the object sought. The proper plan is for a few enterprising and experienced breeders to begin with one of the pure-bred families, and select not only the most prolific hens, but to breed the cocks from dams noted for excellent qualities also, until, in a few years, there will be an established family, as is done with Jersey cattle, many of the breeders of which have totally eliminated all exterior qualifications, making the pail the only true test. It will, of course, be more difficult to keep a record of hens, as they are too prolific to establish for them a register, but in one respect this is an advantage, as it gives a larger number from which to select, and those interested may easily keep a private record and note improvement.

It is but fair to state, however, that our poultry breeders have accomplished a good work in establishing and classifying the different breeds. Though they have given preference to ornament rather than to utility, yet there can be no objection to any system that will tend to the improvement of those qualities that serve to render the breeds better for eggs and carcasses, and each and all of the breeds can be used as a foundation for experiments in some particular direction, while every farmer should join in the work. J. P. H.

A SUGGESTED IMPROVEMENT.—I could improve the feeding box for hens on page 809, by having a larger box and two slanting boards inside to meet at the top and slant down so that there would be a feeding trough at each side. Thus one could feed corn and oats separately, or by partitioning off one-third of one side, ground shells or bones could be fed at the same time. J. H. O.

Dairy Husbandry.

DAIRY NOTES.

T. D. CURTIS.

CHICAGO SWILL MILK.

THE foulness of the distillery stables of Chicago, as described by the Chicago press, and the manner of keeping the cows in their filthy stalls, getting no food or drink but the distillery slops run to them through foul channels, is very suggestive and very disgusting to milk consumers. Add to this the prevalence of disease among the cows, as the natural consequence of the way in which they are kept, and the picture of nastiness is complete. It would seem that nothing could more forcibly illustrate the low moral status of those who deal out the deadly fluid of corruption and disease, and the degeneracy of the business plans on which men are struggling for the means of subsistence. Not only is the milk diseased when drawn from the cows, but it grows more and more filthy every moment it remains exposed to the foul atmosphere of the stables and their surroundings. The wonder is that it ever reaches the consumer in a condition not to so offend the nostrils and palate as to cause its peremptory rejection. And then to think of its being used for food for infants! How is it that the health authorities of any city can permit the existence of such abominations? Swill milk from diseased cows, and bogus butter made from the fat of animals dying of disease, appear to be among the normal products of Chicago, as they meet with no open public protest and are not seriously interfered with by the authorities! The traveler who is at all squeamish about the food he eats will be inclined to give that city a wide berth.

CENTRIFUGE BUTTER.

There has been, and we suppose will continue to be, for some time to come, a good deal of discussion about the keeping qualities of butter made from cream taken from milk by the use of the centrifugal separator. The testimony is contradictory; but in this case I consider the unfavorable evidence in the same light as any other negative testimony. If only one man has succeeded in making butter of good grain, good flavor, and good keeping quality, by the use of the centrifuge, it shows that the thing can be done, under favorable conditions and by good management. It appears that a great many have done this. The failures, therefore, must be in the operators and not in the machines. But as the machine throws all the heavier materials to the circumference, and thus effects a general purification, may it not thus deprive the cream of some of its valuable ingredients, as well as of its impurities? Are the minerals—the phosphates—all held in such perfect solution that no loss occurs to either the cream or the skim-milk?

WARM STABLES.

Are your stables for your cows warm and well ventilated, so as to be both comfortable and sweet? If not, set to work at once to make them so, for in this you will find true economy—both a saving of food and an increased product, if you are making butter or cheese, or simply peddling milk. But do not seek to secure warmth by the close confinement of your cows. There must be a free circulation of air in order to secure the good health of the cows and a sweet-flavored product. If with good ventilation, letting the air in at the head of the cows and out at the rear, you can not keep up the required temperature, then resort to artificial heating. It will pay. Once the arrangements are made for heating, the expense will be comparatively small, as a high temperature will not be required. The range of temperature for health and comfort is about 15 degrees—that is, from 45 to 60 degrees Fahr. Below this, cows standing in the stall will begin to shiver and feel uncomfortable; above, discomfort follows and they will begin to pant. It is much cheaper to burn fuel in a heater than food in the cow to keep up the animal heat.

AVOID CHILLING YOUR COWS.

Remember that the least chill of the cow shrinks her mess of milk and affects her general health. Even exposure to the chilling blast of a cold day long enough to drink at a trough in a barnyard has been found to produce a considerable shrinkage of milk. It is wise economy, therefore, to provide for watering cows without such exposure. Some dairymen even resort to warming the water to 60 or 70 degrees before setting it before the cow, and find it pays for the expense and trouble in the increased flow of milk. Stirring in a handful or two of meal to each pailful gives a relish to the drink and adds to its consumption. This is an advantage in the way of nourishment, and it is self-evident that considerable water is required for the production of milk containing 87 per cent. of water. If the water is not warmed artificially, then its temperature must be raised in the cow's system, and an additional amount of food for this purpose will be required.

PROVIDE SUITABLE FOOD.

As something cannot be produced from nothing, it is not reasonable to suppose that a cow can lay on flesh and fat, or give a large amount of rich milk on a small supply of poor food. Then it is the part of wisdom to provide a full supply of suitable food for milk production, and to give it to her regularly. Do not keep her on nothing but corn-stalks, or nothing but hay, but mix or alternate these, and supplement them with a mixture of corn meal and wheat bran. Variety and a due balance of the nitrogenous and carbonaceous foods are essential.

The Apiarian.

BEE NOTES.

Seal extracted honey at once; bee stings; best bees; comb foundations; winter feed; bees and grapes; marketing honey; precautions in wintering.

HONEY, like maple sirup, loses its flavor and becomes stale by exposure to the air. It must remain in the hive until it is thoroughly ripened, and, when extracted, should be sealed up at once in order to preserve the fine flavor and aroma that make it the luxury that it is.

In walking among the hives there is little danger of stings unless the bees are disturbed. Quick motions irritate the bees. Smoke frightens bees so that they do not dare to sting. Lack of confidence on the part of the operator is a fruitful source of stings, as is, also, the leaving of honey where robber bees can find it. Trees set thickly between the apiary and highway protect passers-by from attacks, as the bees fly *over* the trees.

No one variety of bees possesses all the good qualities. The common black bees will store the most honey when the flow is abundant, but the Italians will surpass them working on weeds. The blacks are the best comb builders and their combs are also the whitest. The best varieties of bees should be crossed, and bad qualities bred out.

It pays to use comb foundation in section boxes, but it is doubtful if it is profitable to use it in the brood apartment when hiving swarms.

Cane sugar is the best food possible for wintering bees, and it is advisable to serve all the white honey possible in sections and, if the bees are lacking in stores, feed them a sirup made of cane sugar. In buying honey to feed bees there is danger of introducing foul brood into the apiary.

Bees do not injure sound grapes, but when the grapes are open the bees cause trouble by sucking the juice. It is impossible to shut the bees in, as the time of the grape harvest is too long. Bagging the grapes will prevent all trouble, but, considering the low prices at which grapes are sold, this is too expensive in many instances. Grape growers must remember, however, that grapes cannot be successfully grown without the aid of the bees in fertilizing the blossoms, hence the bees must remain if people expect to grow grapes. (?ED.)

When sending honey to market each bee-keeper should put his name and address upon each section, using a rubber stamp. Each crate should also be stenciled with the grower's name and address. Some bee-keepers place inside each crate a fine, large card upon which is printed "Fine Comb Honey from the Apiary of——" then follow the name and address. The grocer can hang this card "in some conspicuous place." Very much may be done to advertise honey and create a market, by exhibiting it at fairs and selling small packages.

In wintering bees it is an excellent plan to put a shallow rim, two inches wide, under the hive. It allows dead bees and rubbish to drop out of the way, keeps the combs dry and clean and prevents any clogging of the entrance.

Genesee Co. Mich. W. Z. HUTCHINSON,

Horticultural.

VARIOUS EXPERIMENTS.

EVERY horticulturist and every farmer should have on hand each year one or more experiments in the way of cross-breeding plants or animals. I have the following to report:

SWEET CORN—I have received two valuable sweet corns, only one of which is, I think, of superior worth. This is a cross of Moore's Concord and the Red Sweet with Blount's (Tennessee. Eds.) Prolific, giving me a very tall, rank-growing stalk with abundant foliage and ears often six and seven feet from the ground. With decent culture there are almost invariably two ears to a stalk. Color white, with occasionally a flush of the red—no red kernels. Ears large.

BEANS.—I have among several hundred crosses not less than 50 of the white wax pods, of all shades from pink white to silver white. Among them are several with beans also white. Some are pole, others bush. Many of them carry eight or nine beans to the pod. The Golden Wax has rotted so badly of late that these new varieties will doubtless be of value. I have crossed the Lima, but so far have only two or three results of any value; all of these are smaller and more prolific. I have also secured a White Cranberry, the pod remaining red. A cross of Refugee, alone, in all the collection, matures very late; so late that it furnishes shell beans until mid-October. These beans are very curious in many ways, and probably out of the whole there are 100 varieties equal to the best in cultivation. But I am not satisfied, because, so far, I am unable to secure a Lima cross that will replace the Lima to advantage. The wax beans I have decidedly improved.

GLADIOLI.—I have several hundred seedlings from crossing the choicest old stock. These took the first premium as seedlings at the State Fair and have been reported on in the RURAL by Mr. Woodward. I had, in fact, only about 25 varieties in blossom at that time, and only one or two of those would rank among my finest.

With Gladioli I shall begin another large sowing. It needs patience, as the best seedlings do not blossom under four years.

[They sometimes bloom with us the third year.—EDS.]

GRAPE SEEDLINGS.—I have now begun a series of experiments with grape seed from Iona, Herbert, Lindley, Massasoit, etc. I have a conviction that we may look for fine results in what may be called the second cross of Roger's Seedlings. He has already secured a blending of foreign and native blood; and his seedlings give us the first generation from the cross [Minnehaha is such a grape Eds.] Better results may be looked for in the second or third generation from seed without farther crossing. The possible permutations from a cross do not spend themselves for many generations, any more than a cross of French and Irish parents will show all results in the children of the first generation. Indeed it is very difficult to settle any cross. Break up a variety of beans and corn, and you will find it a very serious affair to get the results fixed or established. One pod of beans from such a cross, apparently established, will, if planted in one hill, give you a half dozen quite distinct kinds, some bringing out a tendency to climb, derived from some ancestor far back perhaps: others going to the bush form; some turning back to yellow, others to red or white. In the same way we can be sure that grapes crossed and once brought to fruitage have not come to an equilibrium. In Rogers's Seedlings we have some of the best results of hybridizing, and some of the best possibilities for other results.

CURRANTS.—Besides my grape experiments, I shall experiment with currants. We still lack the ideal currant—a red currant as good as the White Dutch at its best, and as large as Fay's, and even better in the stem. We have no really fine red currant. The White Dutch and White Grape in quality surpass all the reds. E. P. POWELL.

MY JEWELL STRAWBERRY PLANTS threw out very few runners; while Belmont, set in the same row, sent them out in abundance. Both sorts had just the same treatment. A strawberry grower in a neighboring town had precisely the same experience with his Jewells, while a dozen Belmonts, set at the same time, would give nearly 1,000 plants. Have others noticed the same thing, or is it peculiar with us? It may be due to the season, as one or two other sorts which generally keep me busy cutting runners, have this year acted about like the Jewells. E. C. W.

Thetford, Vermont.

Rural Topics.

Notes from the Western New York Farm.

IN putting in pipes for supplying water, whether from a tank and windmill or from a spring, it does not pay to use those that are too small. The time wasted in waiting for the water to run would soon pay for the larger ones and leave a good margin for profit. Those which were in our old barn have been in use now about nine years, and when taking them down recently to put in larger ones we found them so filled with rust that in many places the bore was not over three-eighths of an inch. In putting in the new ones 1¼ inch were used for mains, and one inch for service pipes, and the Wells Rustless Iron Co.'s pipe was used in place of the common. From the appearance I am much pleased with it and believe it will prove practically rust-proof. If so, no one would begrudge the small difference in price, which for inch pipe is less than 1½ cent per foot.

* * *

We harvested this year the best crop of mangels we have ever grown. The varieties were Mammoth Long Red, Orange Globe and Golden Tankard. The average yield was at the rate of over 30 tons per acre, and the best ones went over 34 tons. The Golden Tankards were immense, and are of fine shape. My new way of raising them in hills gives an immense yield of medium-sized roots and these please me better than the very large ones. I can't see how any farmer can afford to winter his stock without plenty of this very healthful food.

* * *

One of my neighbors has been trying to burn his old straw, and when he was not successful in this, he gave it to anyone who would draw it away. He claims that he can use commercial fertilizers cheaper and to better profit than to draw out and scatter his straw. I call this man a crank, for while it may be true that there is but very little plant food in the straw, its use upon the land with me has a mechanical effect which would pay for its application even if it contained no plant food. But then the true way to use straw is as part of the ration for fatting stock and as an absorbent for the liquid voidings of the same. I can find no fault with anyone who buys and uses commercial fertilizers if he can do so making crops pay for them besides labor of production, but any man who cannot use his straw and coarse fodder to better advantage than to give it away must be lacking in the knowledge of the farm and of stock growing. I have a use for much more straw than I can grow, and it pays me to buy it.

J. S. WOODWARD.

Farm Topics.

REMINISCENCES OF THE "GOOD OLD TIMES."

IN the RURAL for November 14th, page 753, is a letter headed "The Good Old Times," in which a veteran Orange County farmer at Goshen, New York, is reported as saying: "I guess that all those farmers who are groaning so about low prices and high taxes and who are longing for the 'good old times' don't remember much about these same 'good old times.'" He also says: "I can remember when we were compelled to haul our grain, butter, pork and eggs all the way to Newburg, getting generally 15 cents a bushel for oats, and 10 cents a pound for butter; 75 cents a bushel for wheat were fancy prices; nice corn-fed pork dressed for $2 a hundred." Also that he paid for taxes $100 on 100 acres of land when he was getting only 10 cents a pound for his butter, while now on the same farm the taxes are $42.50, and his dairy brings, the year round, nearly three times 10 cents for butter; so that such butter as he sold for 10 cents a pound would now bring him 75 cents easily if he had such to sell.

It is always interesting to hear and know of the "good old times," but in this case it seems to me that this same veteran farmer is liable to the imputation that others don't remember the good old times, from the fact that he has not given any dates to show when he paid his $100; whether that was of yearly occurrence or only a special tax that did not occur again. Had he given the year or years when he paid such taxes, the readers could have some data for comparing the past with the present. Now, I have some means of knowing of past times, and will give some statements from sales and account books kept by me and my ancestors, not from guesswork as the veteran farmer of Goshen seems to have done. It is 53 years since I paid my first taxes on my farm, which were then $7.49. From that time to 1846—a period of 13 years—the taxes had increased to $10.68—the amount paid that year. In 1843 25 acres of land were purchased 5 acres of which have since been sold. Although the purchase had been made three years, the taxes had increased in those 13 years of old times but $3.19. In 1860 my taxes were $42.10; in 1861, $58.70 were paid; $108.50 in 1863; $201.02 in 1864; $492.53 were paid in 1865, which was the highest amount paid. In 1866 $142.83 were paid, where the taxes have remained very steadily from that time to the present on 190 acres of farming land. When we paid high taxes during the war, farm produce was high; now farmers find produce generally low compared with farm labor and taxes.

In regard to prices I have received better

pay for farm produce than the veteran farmer from Goshen did for his, as 44 cents per bushel has been the lowest for corn sold; 25 cents per bushel for oats sold for shipment to New York by boat in the Fall: $1 for wheat, while in 1837 it was sold for $2. Three cents a pound for beef, and 3½ cents for pork are the lowest prices taken from my farm sales book in the good old times of my beginning farming; while oats reached 50 cents per bushel and pork 10 cents a pound in the hog, before the war; which are the times many farmers call the "good old times," when taxes were cheap compared with those we have to pay at present. Labor was also cheaper and better than now, especially farm labor. Wool brought a much better price years ago than now. My first sale was at 35 cents per pound, against 25 the past few years. When farmers complain of low prices and high taxes at the present time, I do not think they should be accused as grumblers without cause. No one wishes the world to revolve backwards, but very many do wish for an honest and economical administration of public affairs, and as a consequence a very much lower rate of taxation would be the result. My advice to the veteran farmer of Goshen, is to make butter of his milk, and sell it for 75 cents a pound. He is losing fearfully in selling his butter below 30, as he says he is. The above statement of old times is from another veteran farmer.

Oneida Co., N. Y. JONATHAN TALCOTT.

CORRESPONDENTS' VIEWS.

NO DUDEISM ON THE FARM.—Some time since Prof. (Roberts I think) advised farmers to wear gloves while at work, to prevent hardening and otherwise injuring the appearance of the hands, and gave the girls some advice as to the treatment of those who did otherwise. Does the Prosessor wish us to wear veils to prevent tanning our faces? There is just as much necessity I think. After work is done the farmers may fuss over their hands as they choose; but I hardly think that even Professor Roberts can induce many farmers to wear gloves for any length of time while at work except in severe weather or unusual work. For during warm weather if made of leather, they are clumsy and warm so as to be uncomfortable, and, if of cloth, they would last but a short time and still be open to many of the same objections, and at some kinds of work requiring much finger-labor farmers will throw the gloves aside rather than be bothered and delayed, as no one can do the majority of work as easily or as well with the gloves as without. For instance, try to pick up a pin with them, and even in such rough work as chopping wood in cold weather, choppers throw them aside as soon as their hands are warm, as without them they can hold on to their tools more easily.

As to the girls, I agree with the Professor that if they are ashamed of the young men on account of personal appearance, they had certainly better let them alone, and I can say further that the girls that are ashamed of our hands because they are tanned with honest toil, are not the kind that we farmers want for our wives, and with the Professor I advise them not to marry us—if they get a chance—but they had better take some white-faced, white-handed "counter jumper" for whom they are better adapted.

Norfolk Co., Va. EVERETT E. BROWN.

"FAST" AND "SLOW" TIMES CAUSE LOSS OF TIME.—In traveling through Ohio and Western Pennsylvania I found that people are losing much time in a singular way. They have sun or common time generally called "fast time", and standard or middle time called "slow time." The difference between the two varies from 20 to 40 minutes. The railroads are run by "standard" time, while most clocks and watches are run by sun or "fast" time. People who travel frequently have watches and clocks set by one time or the other, and add to, or subtract from the apparent time, as the case may be. Farmers and others who travel but little, leave home on "sun" time, and find themselves half an hour or so ahead when they reach the train. This difference in reckoning results in a great loss of time and temper. Confusion and delays come from it. It seems as though the best way to remedy the trouble would be to bring about a general adoption of railroad or standard time. If this were done, it might seem for a time that the sun rose a little later, and that darkness came a little earlier, but after people were used to it it would seem right, and surely many delays would be done away with. J. H. G.

Queens Co., N. Y.

POLITICAL ECONOMY FOR FARMERS.—We like to read the ideas of Bucephalus Brown, but we like best of all the suggestions regarding the study of political economy by farmers. Questions pertaining to it are now under discussion. Will not farmers take a hand and bring out their side? Surely such questions relate to farmers in a wonderful degree. Farmers cannot do better than to dig into these things. Buy an elementary work on political economy, you men who are all the time complaining about the unjustness of the farmer's lot, but are so misty as to the reasons you assign for it. Spend the winter evenings in mastering its contents, and see if your ideas do not broaden out and lighten up before Spring. I know they will because I have tried this thing. JAYHAWKER.

Field Crops.

POTATO-ROT.

THINKING that perhaps the scab in potatoes might be produced from some germ adherent to the seed, I, last May, put the sets for four rows into a very dilute solution of carbolic acid in water, and let them remain in it about an hour. When I dug these rows, and those adjoining, all of a good productive white sort, there was not much difference as to scab, all having some of it; but the rows from dipped sets, were injured rather the least. There is, however, a decided difference in regard to rot: only two tubers were affected visibly in those four rows, while in others many were damaged. But as 'one swallow does not make a Summer,' so one trial does not test a process, and the carbolizing must be tried again. Experience here seems to show that the scab is caused by larvæ whose term of life expires early in August. They come with some sorts of animal manures, if not already in the soil. Where soil from the grading of a houseyard was hauled to a potato patch and spread over part of it, the scab was general so far as that went. In the earliest dug potatoes a small, active, many-legged and two-horned almost transparent caterpiller-like grub was found, by the aid of a magnifier in some of the deeper scab cavities. Excrement remained in abundant droppings. The tuber is entirely good excepting the portions eaten out, and the film of scab is easily scraped away. Some rows of the same ground had about a quart of coal ashes put in the furrow at each hill, and the sets were buried in it. As far as that reached, the tubers were fair and clean with very little exception, and there were but very few cases of rot. GARDENER.

CLOVER IN TENNESEE.

I was told before leaving the North that clover would not grow here, and that I could not get the advantage of that great fertilizer. Lying near my house is a field that was seeded in the Spring of 1878 to common Red Clover. It has been mowed four years in succession, and has raised each year a crop of clover-seed, and as there was no huller, it was thrashed with a flail. Two crops of corn were then made on the ground, and last Spring a crop of oats was sowed. This fall there is as good a stand of clover upon the ground as ever, from the seed that remained in the soil.

The Southern-born people never sow it, as they say it is impossible to get it out of the ground when once caught. We have a very fine country and climate in Lawrence County, and now that emigration has set in southward, it will be rapidly settled no doubt.

Lawrence Co., Tenn. V. S. PEASE.

FERTILIZERS FOR POTATOES.—Mapes' Potato Fertilizers on very poor soil, using 1,000 pounds per acre, gave us a yield of 300 bushels of the best tubers I ever saw. The best hill gave 10 potatoes weighing six pounds. A very large number would weigh two pounds each. One bag of Mapes potato manure saved till August 10, and sowed on three-quarters of an acre of oat stubble, gave more than 100 bushels of English turnips. I think I never expended $46 to better advantage than when I bought a ton of this potato fertilizer.

Charlton, Mass. E. C.

Farm Economy.

PARIS-GREEN *vs.* SLUG-SHOT.

A QUESTION OF ECONOMY.

IN these days of dull markets and low prices the question of economy is specially important to the farmer. I see that some of our best farm papers continue to sound the praises of a mixture of Paris-green and plaster, that for several years has been offered for sale and extensively advertised under the name "Slug-Shot." I know, and suppose every reader of the RURAL knows, that this mixture is excellent for destroying many of our most troublesome insects. I have not the least objection to calling it "Slug-Shot," for this is a shorter name than "Paris-green and Plaster." I do not see that it is worth while, however, to pay $8 to $10 in cash for 100 pounds of this mixture, put up in neat packages and labeled "Slug-Shot" when I can buy the ingredients and mix them myself at a cash outlay of $1.25 to $1.50.

Mr. Hammond's advertised retail prices for Slug-Shot are four to five cents per pound. This makes it cost $80 to $100 per ton. A ton of Nova Scotia plaster is worth about $7, and a good quality of Paris-green can be had at retail at 40 cents per pound. One pound of the poison to 100 of the plaster is abundance; for the last two seasons I have used only one to 150. This makes the Paris-green for a ton of plaster worth from $8 down to $5.33, and the ingredients for a ton of the mixture are worth $15 or $12.33. I can have my man do the mixing in bad weather, so that the labor costs very little.

To be sure, Mr. Hammond puts in something else—oxide of iron, I believe—which he claims is an antidote for the Paris-green when eaten by man or domestic animals; but which for some unexplained reason fails to act when an insect eats it. I am assured by one of the best chemists in New York State that this oxide of iron acts as an antidote but for a very short time after it is put in, and that even if its action were permanent, it has no power of discrimination between insects and domestic animals. This part of the claim must certainly be regarded as a myth.

But for this claim it should not be said that the manufacturer of Slug-Shot is doing an illegitimate business. He advertises and sells an excellent insecticide. The only question is, can the farmer afford to pay so large a bounty for mixing ingredients that he can readily mix for himself?

Geneva, N. Y. E. S. GOFF.

LIVE STOCK FOR MANURE.—The farmers around here who have the most to say about hard times are those who have been keeping the least stock. As a result of their scrimping on the manure pile, their farms don't produce half what they should. Such people come and ask me if it pays to keep cows, hogs, colts and so many turkeys. I can only say, "See what my farm produces by the side of yours." For years I have drawn my manure directly from the stable to top-dress the rye. In this way I save all the urine. The manure is saved from spring freezing and thawing and one handling is done away with.

Albany Co., N. Y. S. M. LAGRANGE.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

HERE are some recent decisions of the Courts in various States, which are of special interest to farmers. The laws vary considerably in the different States, yet, as a rule, decisions in one have great influence on decisions in all the others, unless the law on the points is distinctly different.

LIABILITY OF WIFE'S SEPARATE PROPERTY GIVEN AS SECURITY FOR HER HUSBAND'S DEBTS.—Where a husband is insolvent, and his wife executes a deed of trust conveying her separate property as security for the payment of her husband's debts, and on this ground he is granted an extension, the consideration is sufficient to support the deed. If fraud has been used to secure the conveyance, the wife must move, immediately upon discovering the fraud, to rescind the conveyance or the deed will be upheld.—Burkle *vs.* Levy. July 28, 1886.—Cal.

DOWER.—In 1875 the Minnesota Legislature passed an act abolishing dower, and giving to the wife, upon the death of her husband, a life interest in the homestead and one-third in fee in any other real property of which the husband died seized. Where prior to the passage of this act a husband had conveyed lands in which conveyance his wife did not join, her right of dower in such lands was inchoate and was abolished by said enactment.—Morrison *vs.* Rice.—Filed July 14, 1886.—Minn.

MORTGAGE FOR MORE THAN THE DEBT.—Where a chattel mortgage is made for more than the actual debt it is a badge of fraud. In such case where a son gave a chattel mortgage to his mother for $350 more than the real debt and the mortgagee had said to a third party "she knew the mortgage was drawn for more than Frank owed her, but she thought it would keep his creditors off." Held that the mortgage was fraudulent and void as to creditors. Taylor *vs.* Wood—N. J., September 29, 1886.

HOMESTEAD.—EFFECT OF MORTGAGE IN WHICH THE WIFE DOES NOT JOIN.—A husband, the owner of a homestead, cannot make a valid mortgage on his homestead without his wife joining in the same. If there be parts of a tract of land owned by him which is not embraced in the homestead, this rule does not apply to such portions of his lands. Swift *vs.* Dewey.—September 15, 1886, Neb.

W. H. L., Indianapolis, Ind.—1. In the transfer columns of the daily papers we often see such notices as this—Martha Hunt and husband to Gideon Dunham—Then the transferred real estate is described: now if Martha's husband was in debt to me before Martha began to sell real estate could I collect the debt from any real estate they yet own? 2. H. buys goods from C. while a single man; while still in debt he marries, does his doing so free him from the obligation of paying for the goods he bought before the wedding? 3. A. owes B. for groceries; while the debt is unpaid A transfers his property to his wife; can the bill be collected from the transferred property, and if A dies is the transferred estate responsible for the debt? 4. Can a garnishee on a married man's wages in this State be collected?

ANS.—1. When a wife sells real estate of her own, the husband joins in the deed to extinguish the rights of joint tenancy, which he possesses and which give him the privilege of holding possession of his wife's property as tenant by courtesy while he lives. He has no estate in the property which could be levied on under any judgment. 2. This depends upon the local law relating to the garnishee of a married man's credit. In many Western States a married man's wages are not subject to garnishee. If this man earns wages after he is married, it is clear he is not subject to garnishee because of his exemption, and his previous debts cannot be collected in this way. 3. The transfer of property to a wife under the circumstances would in all probability be held to be a fraud and would be void. A transfer for a proper consideration would be lawful, but one without consideration would not stand against the collection of a debt. 4. If the man is a resident of Indiana and his wages are exempt from garnishee, they cannot be attached for debt. 5. We don't understand the "beer" question.

B. B. R., Greenlawn, N. Y.—A sells his farm to B and takes a mortgage for a part of the purchase money, but neglects to get the mortgage recorded. B borrows money of C, who on searching the record finds nothing against the property and therefore lends the money on mortgage. Between the time of searching the record and lending the money A records the mortgage. The two mortgages come to more than the farm is worth; what can C do to collect the money from A or B.

ANS.—If B makes no secret of the prior mortgage to A and did not make any false statement in regard to it, C has no remedy for his own failure to make himself safe by having the mortgage recorded before he parted with his money. In affording this opportunity during the short time elapsing before the money was paid over, he made an error and can blame nobody but himself for his carelessness. If B made any false statement and denied any prior mortgage or made any representation tending to mislead C, he may be prosecuted criminally for obtaining money under false pretences.

R. W. L., Westchester Co. N. Y.—Is an alien liable for taxes on personal property in this State?

ANS.—In this State there is no distinction between a resident alien and a citizen in the matter of taxation.

Miscellaneous Advertising.

Rheumatism

We doubt if there is, or can be, a specific remedy for rheumatism; but thousands who have suffered its pains have been greatly benefited by Hood's Sarsaparilla. If you have failed to find relief, try this great remedy. It corrects the acidity of the blood which is the cause of the disease, and builds up the whole system.

"I was afflicted with rheumatism twenty years. Previous to 1883 I found no relief, but grew worse, until I was almost helpless. Hood's Sarsaparilla did me more good than all the other medicine I ever had." H. T. BALCOM, Shirley Village, Mass.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

GOLD MEDAL, PARIS, 1878.

BAKER'S

Breakfast Cocoa.

Warranted *absolutely pure Cocoa*, from which the excess of Oil has been removed. It has *three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup.* It is delicious, nourishing, strengthening, easily digested, and admirably adapted for invalids as well as for persons in health.

Sold by Grocers everywhere.

W. BAKER & CO., Dorchester, Mass.

AT, or shortly before, the opening of the subscription season every year several bogus agricultural, literary and political papers are widely advertised, usually at very low figures, while marvelous inducements in the way of premiums and gifts are offered to credulous subscribers. Indeed so generous and alluring are these offers that many who care nothing for the paper are led to subscribe for it through a desire to obtain the splendid presents with glowing accounts and pictures of which it seeks to begnile the gullible. In some cases every subscriber besides the paper is to get a present, often worth more than the subscription price; in others various tasks must be done to obtain the coveted reward, such as finding out a text in the Bible; building up words from a certain sentence or combination of words, etc., etc. In all cases much is said of the value of the premiums and little of the merits of the paper. As the advertisers never really intend to deliver the premiums, of course they can afford to be very liberal in their promises. Some of the rascals have been practicing the same swindle for years, now in one town, now in another; now under one name, and again under another. Sometimes the same fraudulent paper is advertised year after year. In such cases of course the advertisers do not expect many of the former swindled subscribers to subscribe again, (though some of them are sure to do so), but new dupes will be entrapped because, having seen the paper advertised year after year, they suppose it is a genuine concern and that its offers of gifts are *bona fide*. In reality, however, these swindling advertisers issue only a few numbers during the subscription season, and after they have raked in all the money they can get, they suspend till the next subscription season, or finally collapse. With regard to the premiums either none are ever given, or a demand is made for money for packing and mailing the present, and in return for eight or ten cents sent for this purpose, the dupe receives some paltry article worth two to five cents, and on which the postage is only one cent, the swindler pocketing the difference. Often he pockets the whole amount sent for postage as well as the subscription money. Of course, now and then a new venture of an honest nature is started at this season; but to the man of sound sense there is a vast difference in the way the two are launched. Common sense is an excellent detector of the bogus from the genuine. Wherever extravagant offers are made, this at once detects insincerity and knaving. Thoughtless greed in the dupes is the great cause of gain for the swindlers. Many people are vastly too covetous. They want to get something for nothing or for half its price. It is to this trait in poor humanity that swindlers appeal, and they seldom appeal in vain.

This remark applies also to the advertisements of wonderfully cheap holiday presents, so common at this season. A very large number of these are fully worth the prices asked for them; but it would be foolish to imagine that the cheapest of them are worth a quarter of a cent more. A little common sense should tell any one that there is no need of advertising things for less than their value; people are always ready to take such bargains in any quantity in every large town in the country. Custom gives advertizers great latitude in puffing their goods, and purchasers must always take this fact into consideration. Only a simpleton will expect a dollar article for 50 cents, whatever the advertisement may say.

TO SEVERAL INQUIRERS.—We are assured that the Western & Wells M'f'g Co., of Philadelphia, Pa., is trustworthy..... ...We can not recommend the National Supply Co., of Cincinnati..... .....We do not recommend the medicines offered by "Dr. Dennis" of this city, though doubtless they sometimes do good. Better consult a local doctor, and get your medicines from a local drug-store. They will do you much more good, and cost much less.....We have repeatedly said that J. H. Reeves of this city, and his "Dr. Churchill's Restorative Remedies" are scandalous humbugs, yet we are constantly receiving inquiries about them. The more we learn about them, the stronger grows our conviction of their turpitude.....We do not recommend "Professor" F. C. Fowler, of Modus, Conn., or his nostrums.....We cannot recommend the Culverwell Medicine Co., of this city.

Miscellaneous Advertising.

DIXON'S "Carburet of Iron" Stove Polish was established in 1827, and is to-day, as it was then, the neatest and brightest in the market; a pure plumbago, giving off no poisonous vapors. The size is now doubled and cake weighs nearly half a pound, but the quality and price remain the same. Ask your goocer for Dixon's big cake.

THE GIANT OF MEDICINES.

THE MOST EFFECTIVE AND POPULAR REMEDY EVER DISCOVERED.

WHY IS IT SO EFFECTIVE IN SO MANY DIFFERENT DISEASES?

WHY one remedy can affect so many cases is this: The diseases have a common cause, and a remedy that can affect the cause, permanently cures all the diseases. Unlike any other organ in the body, the Kidney when diseased, may itself be free from pain, and the very fact that it is not painful leads many people to deny that it is diseased. But *Medical Authorities* agree that it can be *far gone with disease and yet give forth no pain*, because it has few if any nerves of sensation, and these are the only means of conveying the sense of pain; thus unconsciously diseased *it affects the entire system*. We do not open a watch to see if is going or is in good order; We look at the hands, or note the accuracy of its time. So we need not open the kidney to see if it is diseased. We study the condition of the system. Now then, *KIDNEY DISEASE* produces Any of the *following Common and Unsuspected*

SYMPTOMS: Backache: *Unusual desire to urinate at night;* Fluttering and pain in the heart; Tired feelings; Unusual amount of *Greasy froth in water;* Irritated, hot and dry skin; Fickle Appetite; Scalding sensations; Acid, bitter taste, with furred tongue in the Morning; Headache and Neuralgia; Abundance of *pale, or scanty flow of darkcolored water;* Sour Stomach; Heartburn with Dyspepsia; Intense pain, upon sudden excitement, in the Small of the Back; *Deposit of mucous some time after urination;* Loss of Memory; Rheumatism, chills and fever and Pneumonia; Dropsical Swellings; Red or white brick dust, *albumen and tube casts in the water;* Constipation, alternating with Looseness; Short breath, Pleurisy and Bronchial affections; Yellowish pale skin, etc.

These are only the *chief disorders* or symptoms caused by a diseased condition of the kidneys. Now then, isn't it clear to you that the kidneys, being the cause of all the derangements, if they are restored to health by the great specific "*Warner's SAFE Cure*," the majority of the above ailments will disappear? There is *NO MYSTERY ABOUT IT.* It does cure many bad states of the system precisely as we have indicated. Now when the kidneys are diseased, the albumen, the life property of the blood, escapes through their walls and passes away in the water, while the urea, the kidney poison, remains, and it is this *kidney poison in the blood*, that, circulating throughout the entire the entire body, *affects every organ*, and *produces all the above symptoms.*

Therefore, we say confidently that "*Warner's SAFE Cure*" is *THE MOST EFFECTIVE MEDICINE EVER DISCOVERED* for the human race. It is the common remedy which, overcoming the common cause, *removes the greatest possible number of evil effects from the system.* Let us note *a few* of these diseases, and how they are affected by kidney poison and cured by

"WARNER'S SAFE CURE."

CONSUMPTION: In a great many cases Consumption is only the *effect* of a diseased condition of the system and not an original disease; if the kidneys are inactive and there is any natural weakness in the lungs, the *kidney poison attacks their substance and eventually they waste away* and are destroyed. Dip your finger in acid and it is burned. Wash the finger every day in acid and it soon becomes a festering sore and is eventually destroyed. The kidney poison acid in the blood has *the same destructive effect upon the lungs.* For this reason a person whose kidneys are ailing will have grave attacks of *Pneumonia* in the Spring of the year, Lung fevers, Coughs, Colds, Bronchitis, Pleurisy, etc., at all seasons of the year. Rectify the action of the kidneys by "*Warner's SAFE Cure*," as many hundreds of thousands have done, and you will be *surprised at the improvement in the condition of the lungs.*

IMPAIRED EYE-SIGHT: Kidney acid with some persons has an *especial affinity for the optical nerve*, and though we have never urged it as a cure for disordered eye-sight, many persons have written us expressing surprise that after a thorough course of treatment with "*Warner's SAFE Cure*," their *eye-sight has been vastly improved.* In fact, one of the best oculists in the country says that *half the patients* that come to him with bad eyes, upon examination he discovers are *victims of kidney disorder.* We have no doubt that the reason why so many people complain of failing eye-sight early in life, is that, all unconscious to themselves, their *kidneys have been out of order for years*, and the kidney poison is gradually ruining the system.

OPIUM HABITS: It is a well-known fact, recently shown anew, that opium, morphine, cocaine, whisky, tobacco and other enslaving habits capture their victims by their paralyzing effects upon the kidneys and liver. In these organs *the appetite is developed and sustained*, and the best authorities state that the *habits cannot be gotten rid of until the kidneys and liver are restored to perfect health.* For this purpose leading medical authorities, after a thorough examination of all claimants for the honor of being the only specific for these organs, have awarded the prize to "*Warner's SAFE Cure.*"

RHEUMATISM: Every reputable physician will tell you that rheumatism is caused by an acid condition of the system. With some it is uric acid, or kidney poison; in others it is lithic acid, or liver poison. *This acid condition is caused by inactivity of the kidneys and liver, false action of the stomach and food assimilating organs.* It affects old people more than young people because the acid has been collecting in the system for years and finally the system becomes entirely acidified. These acids produce all the various forms of rheumatism. "*Warner's SAFE Cure*" acting upon the kidneys and liver, neutralizing the acid and correcting their false action, cures many cases of rheumatism. "*Warner's SAFE Rheumatic Cure*," alternating with the use of "Warner's SAFE Cure" completes the work.

BLADDER DISORDERS: Gross and other high medical authorities say that most of the bladder diseases *originate with false action of the kidneys*, and urinary tract. Uric acid constantly coursing through these organs inflames and eventually destroys the inner membrane, producing the *intense suffering.* Sometimes this kidney acid *solidifies* in the kidneys in the form of Gravel, which in its descent to the bladder produces *kidney colic.* Sometimes the acid solidifies in the Bladder, producing *calculous or Stone.* "*Warner's SAFE Cure*" has restored thousands of cases of inflammation and catarrh of the bladder and has effectively corrected the tendency to the formation of gravel and stone. It *challenges comparison* with all other remedies in this work. Buy to-day,

"WARNER'S SAFE CURE."

CONGESTION: Congestion is a collecting together of blood in any one place. If there is loss of nervous action in any organ the blood vessels do not allow the blood to circulate and it stagnates. If this condition exists very long, the collecting blood clots and eventually *destroys the organ.* Many persons are unconscious victims of this very *common condition.* The heart, determined as it is to force blood into every part of the system, has to work harder to get it through the clogged organ, and *eventually the Heart breaks down* and palpitation, excessive action, rush of blood to the head, distressing head aches, indicate that the *Congestion has become chronic* and is doing damage to the entire system. Congestion of the kidneys is one of the commonest of complaints and is the *beginning of much chronic misery.* "*Warner's SAFE Cure*" will remove it.

FEMALE COMPLAINTS: What we have said about Congestion applies with particular force to the above complaints. They are as common as can be, and as every doctor can tell you, most of them *begin in this congestive condition of the system*, which, not being regularly corrected, grows into disease and produces these countless sufferings which can be alluded to but not described in a public print. Thousands have been *permanently cured.*

BLOOD DISORDERS. It is not strange that so many, many people write us that since they have given themselves thorough treatment with "*Warner's SAFE Cure*" their thick and turgid blood, their heavy, blotched, irritable skin have disappeared under its potent influence. The *kidney poison in the blood thickens it.* It is not readily purified in the lungs, and the result is the impurities come out of the surface of the body, and *if there is any local disease all the badness in the blood seems to collect there.* Our experience justifies us in the statement that "*Warner's SAFE Cure*" is "the greatest blood purifier known." The treatment must be very thorough.

STOMACH DISORDERS. Many people complain more or less throughout the year with stomach disorders: Dyspepsia, Indigestion, Waterbrash, heat and distress in the stomach, sharp pains, frequent aches, want of appetite, lack of energy. Now, these are *exactly the conditions* that will be produced in the stomach *when the blood is filled with kidney poison*: People dose themselves with all sorts of stomach reliefs, but get no better: They never will get better until they give their attention to a thorough reviving of kidney and liver by the means of the only specific—"*Warner's SAFE Cure.*

CONSTIPATION, PILES. These distressing ailments, more common among one class than the other, are not original disorders, but are *secondary to imperfect action of the kidneys and liver.* The natural cathartic is bile, which is taken from the blood by the liver. If the liver fails the bile is not forthcoming and the person gets into a constipated habit. This, eventually followed by piles, is almost always an *indication of congested liver*, and a breaking down of the system. Remove the congestion, revive the liver and restore the kidneys by the use of "*Warner's SAFE Cure*," and these constitutional secondary diseases disappear.

HEADACHES: Many people suffer untold agonies all their lives with headache. They try every remedy in vain, for they have not struck the cause. With some temperaments, kidney acid in the blood, in spite of all that can be done, will *irritate and inflame the brain* and produce intense suffering. Those obstinate headaches which do not yield readily to local treatment, may be regarded quite certainly as of *kidney origin.*

THESE ARE SCIENTIFIC FACTS, and, from the way we have set them forth, it will plainly be seen, that the statement we make, that, "*Warner's SAFE Cure*" is the "most effective remedy ever discovered for the greatest number of human diseases," is justified. It is not a remedy without a reputation. It sales for the past year have been *greater than ever*, and the advertising thereof *less than ever*, showing incontestibly that *the merit of the medicine* has given it a permanent place and value.

People have a dreadful fear of Bright's disease but we can tell them from our experience that it is *the ordinary kidney disease that produces no pain* that is to-day *the greatest enemy of the human race*: great and all powerful, because in nine cases out of ten, its presence is not suspected by either physician or the victim! The prudent man who finds himself year after year troubled with little odd aches and ailments that perplex him, ought not to hesitate a moment as to the real cause of his disease. If he will give himself thorough constitutional treatment with "*Warner's SAFE Cure*" and "*Warner's SAFE Pills*," he will get a new lease of life and justify in his own experience, as hundreds of thousands have done, that 93 per cent. of human diseases are really attributable to a deranged condition of the kidneys, and that they will disappear when those organs are restored to health.

ASK YOUR FRIENDS AND NEIGHBORS WHAT THEY THINK OF "WARNER'S SAFE CURE."

CHICAGO DISTILLERY-FED COWS.—A. W. Cheever, of the New England Farmer, recently visited one of the noted distillery stables of Chicago, where large numbers of cows are kept for supplying milk for city consumption. The picture he draws is appalling. The capacity of the establishment is a product of 8,500 gallons of whisky per day, requiring for its manufacture 2,000 bushels of corn. The distilling process removes only a portion of the nutrient elements of the corn, the residue appearing in the form of a thin pudding or crushed corn-porridge, usually termed distillery swill or slop. A portion of the slop is run through spouts into a large elevated tank from which it is drawn off for loading the teams of the farmers, who haul it away to their own stables, but the larger portion is fed to cattle kept in the distillery yard. The cow sheds are the cheapest and poorest of anything in the form of cow stables he has ever seen. They are made of rough boards thrown together in roof form, but so loosely laid as to let in rain, snow and wind to a most uncomfortable degree. Their capacity is about 1,800 cattle, closely stowed in double rows of 50 to 80 each, with narrow alleys in front for feeding and gutters behind for manure. The slop from the distillery, warm or almost hot, is run through feeding troughs in front of each row of cattle by simply opening a slide in a larger trough running the entire width of the long line of sheds. It is the work of but a few minutes to feed the entire herd. The slop is too thin, and the cows are thus forced to take more water than they need and as the ummber has been reduced by disease, and the whole business is more demoralized than usual, there seems to be a tendency towards overfeeding. The swill is so abundant at the present time that a large surplus is run directly into the manure-gutters. No attempt seems to be made at saving any portion of the manure made from the 1,800 cows and steers usually fed there, but it is run off into a large tank from which it is pumped by horse power into barges and floated off by steam power and dumped into the lake.

There were 1,100 cows, steers and bulls under quarantine in the sheds, with three sets of police officers on duty eight hours each, watching the gates to see that neither cattle nor milk are allowed to leave the premises. Mr. Cheever found one of the cattle owners at work in the stables, a Mr. Flynn, who usually keeps about 200 cows for supplying milk to the city. He says the disease has been there for two years, and was first brought there by a cow brought from the stock yards.

Most of the cows, he says, get fat enough for beef in from four to six months, and as they shrink in their milk they are sold and their places filled by a fresh lot. He has had 600 within the past two years, and has lost 128 by the disease, the first symptoms of which are dullness, followed by a loss of appetite, constipation and cessation of milk flow. The cows stand on plank floors, are tied by neck chains to stanchions, and are never turned out from the time they arrive at the sheds until ready for the butcher.

The manure gutters are about four feet wide, six inches deep and fifty feet long, and are cleaned so seldom that they must get about full of slush two or three times a day. There is no way to clean them but to wade in with rubber boots, and with a pushing scraper made of a board three or more feet long and six inches wide attached to a handle, push the contents of the gutters the entire length and out into the sewer outside. When the cows lie down their tails are often in the liquid fertilizer, which is then likely to be thrown pretty much over their entire bodies. It is no wonder that a good deal of city milk has a "cowy" odor.

During Mr. Cheever's visit two veterinarians, Dr. Baker and Dr. Hughes, with a deputy sheriff to assist, came to begin the inspection and marking of the cattle preparatory to appraisal and slaughtering. During the seven weeks since the stable has been quarantined 174 animals, out of a total of 1173, have died or been condemned and killed. Of one lot of 63 Wisconsin cows put in the stables, July 15, 18 had died or been condemned and destroyed before the end of their second month, and of the remaining 45 but ten proved entirely free from disease. Standing directly opposite from these cows was a lot of steers owned by Nelson Morris, a large packer at the stock yards. The condition of these animals was even worse than that of the cows.

It is much to be regretted that the cattle men of the State, particularly the millionaires of the stock yards, do not see the necessity of coming to the front with an earnest effort to wipe the disease out. On the contrary, the stock yards interest has ignored or denied the existence of any contagious disease whatever among the cattle there. If the State of Illinois fully realized the danger that is threatening her cattle industry an extra session of the Legislature should be called by the Governor to devise methods and raise funds for stamping it out before the job grows too big to handle.

SULPHIDE OF POTASSIUM FOR "DESTROYERS AND POISONERS."—Edmund Tonks, in a paper published in the Gardener's Chronicle, gives high praise to sulphide of potassium (liver of sulphur) as a means of checking and suppressing, in man, beast and plant, parasitic destroyers and poisoners. Poisoned wounds, skin diseases and most forms of inflammation involving the formation of pus, if wetted with a strong solution of it, soon take a healthy turn. The most delicate plant may be dipped—pot, earth, roots, leaves and all—in a solution of a quarter of an ounce to the gallon without any danger; twice that strength is safe but needless. It is efficient against red spider, and destroys mildew and is probably equally potent against microbes. Mr. T. says that an endemic disease attacked his large collection of plants, the roots becoming rotten When soaked in the sulphide solution, the rotting ceased and healthy new growth followed. The cost of the compound to him in England was 8d. a pound (16 cents). It is common in drug stores and easily tried.

SOLUBLE AND INSOLUBLE FERTILIZERS.—W. H. Bowker, speaking of the difference in the effects of soluble and insoluble fertilizers, suggests that we apply 100 pounds of nitrate of soda to an acre of grass land and then apply to an adjoining acre 100 pounds of leather waste, containing the same amount of nitrogen. In the latter we see no results because the nitrogen is insoluble. Dried fish applied to the surface of grass land is never satisfactory, either because it loses its ammonia into the air, or because the process of decay is so slow that the plant food is yielded up so gradually that no results are witnessed, but when the same dried fish is applied in the soil, it becomes a valuable plant food. If it seems necessary to have this ammonia and phosphoric acid available, what must be said of the potash? The granite rocks of our hills contain enough potash for all our soils for all eternity. Those who think it advisable to use phosphate rock in its natural condition should with equally good reason recommend the application of granite rock. Yet no grinding, however minute, or even chemical dissolving, has rendered in a practicable way, the potash of these rocks immediately available and we are compelled to fall back upon forms which are soluble, and hence beneficial.

MYCELIUM ON CHESTNUT TREES.—The men of science of our practical times are doing good service in hunting to their lairs the various kinds of obscure but most destructive fungi that have so long preyed unseen upon both animal and vegetable life—the opprobrium of doctors, the work of witchcraft in the eyes of the superstitious, and the consternation of all. In two of the departments of France the chestnut trees are dying from the spread of a mycelium, of which the complete growth—the fungus proper—has not yet been found developed. The chestnut being an important article of human food there, M. J. E. Planchon has given much attention to the case, and has reported to the Paris *Académie des Sciences*. He recommends total extirpation and burning of diseased subjects, planting on entirely fresh ground, and in the case of recent attacks applications of quick-lime, ashes, sulphate of iron (copperas) or sulphate of potassium in such manner as will not injure the tissue of the plant. He does not include boiling water, a simple application which seems to do good in similar affections of other trees.

THE LATEST AND BRIEFEST.

A TRUE agricultural experiment station says Dr. T. H. Hoskins, in the Vermont Watchman, has for its function exactly what its name describes—the making of experiments the purpose of which is to investigate the unsolved questions connected with the practical agriculture of the state or country which establishes them. These unsolved questions are very numerous, and many of them are intricate, requiring much laborious exertion and the tabulation and comparison of results over a long series of years.....

WHEN the State is called upon to help agriculture in this way, it should only be to provide for that sort of work which the ordinary farmer cannot do for himself—the sort of work which takes time, money and trained skill, in order to obtain trustworthy results...

ON the other hand, continues Dr. Hoskins, any cheap attempt at dabbling in this class of work, with no proper conception of what it is, what it will cost and what kind of men it will require to make it effective, is to be earnestly deprecated. "Better do nothing in the matter than set cheap fools to fooling with it"....

IT is quite true, as a Press editorial puts it, that a college course is not so much to fill the student's memory with facts that other people have discovered as to train his mind so that he can use it like a powerful engine under perfect control. The student who acquires a habit of investigation and comparison can be trusted to possess himself of the knowledge he needs in any calling .....

THE agricultural editor of the Weekly Press thinks that the fundamental reason for the lack of success in agriculture is not so much that farmers do not know how to conduct their business, as that they fail to do as well as they know.....

ONE reason for this, continues Editor Stiles, is that they are not brought into contact with improved methods. They read about them and admit their value and then seem to lack the enterprise to adventure any change. If they could see these things and become familiar with them as actual facts accomplished, there would be less difficulty in abandoning the time-honored ways to which they are wedded.....

FROM this point of view we see the benefit of object lessons at the farms; we see the benefit of farmers' clubs. Farmers all know that it is poor economy to keep indifferent dairy cows when heavy milkers can be obtained. But they *act* upon the knowledge when they see how much more milk and cream another farmer is selling whose stock has been graded up.....

THE Canadian Horticulturist says that we give the Earhart Everbearing Blackberry a good puff in our issue of Oct. 23. The Horticulturist says that we claim for it "hardiness, thrift, productiveness and a better quality than Gregg." Yes, that is what we claimed from the test of a *one winter and a single season of fruiting*. The Horticulturist further remarks:

"Now we always read statements in the RURAL with the greatest confidence, because it gives its opinions, as we also aim to do, without fear or favor. But we should require the experience of more than one season to establish our confidence in the wonderful everbearing qualities of the Earhart."

True. To judge of the merits of any fruit from a single year's trial is hasty, to say the least. But we know of no reason why we should not state how it behaved for that one season. If the Earhart fail next Summer, we shall hasten to state the failure .....

STATE MASTER HALE'S address to the Connecticut State Grange speaks of the Sheffield Scientific School of Yale College. It seems that in 24 years there have been seven agricultural graduates. The cost has been $180,000, or $25,000 for each. He asks if it is not true, according to the admission of one of the professors, that the agricultural department is "worse than a failure?" .....

MR. HALE pays a fitting tribute to the invaluable services of Prof. S. W. Johnson. But this fund was given to found an agricultural school where young men could receive instructions in agriculture, and not to hire men to give lectures now and then to agricultural board meetings, farmers' clubs and granges. Connecticut in this matter is not doing right by the National Government that granted this fund, nor by her farmers and farm boys that were to be benefited by it.....

IF we were planting a deciduous hedge now, we should use a variety of plants not set very closely together as in the old way, but so far apart that each plant could show something of its own beauty. We should select the different colored varieties of the Japan Quince, the barberry, the forsythia, Spiræa prunifolia, some of the thorns, a few Roses of Sharon, lilacs, bush honeysuckles, etc. On the outside of these we should run a barb-wire fence as suggested by Mr. Meehan.....

MR. MEEHAN, of the Gardener's Monthly, impresses it upon his readers that a hedge should be kept wider at the bottom than at the top, so that the leaves may all get as much advantage from the light as possible. The more shade at the bottom, the sooner the hedge gets thin and leggy at the base, and this greatly impairs its beauty.....

IT appears that the Blue Gum Tree is not hardy enough to be depended on in Florida, according to the Despatch of that State.....

Catarrh

Is frequently an indication of a Scrofulous taint in the system. Ayer's Sarsaparilla purifies the blood, and thus restores health to the affected membranes. It also stops the nauseous catarrhal discharges, and prevents the infection from reaching the lungs and stomach. Catarrh should be treated as a blood disease.

I suffered for years from chronic Catarrh. My appetite was very poor, and I felt miserably. None of the remedies I took afforded me any relief until I commenced using Ayer's Sarsaparilla, of which I have now taken five bottles. The catarrh has disappeared, and I am growing strong and stout; my appetite has returned, and my health is fully restored.—Susan L. W. Cook, 909 Albany st., Boston Highlands, Mass.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Sold by all Druggists. Price $1; six bottles, $5.

RURAL SPECIAL REPORTS.

Delaware.

DOVER, Kent Co., Dec. 9.—The Fall was warm: apples and cherries were in bloom November 10, and strawberries and roses at Thanksgiving. Corn not more than half a crop. Wheat looking well. Peach trees made a fine growth; the wood was well matured, and they went into winter-quarters in good shape. On November 25 the weather became colder. A great many hogs have died this season with what they call "colery." A large number of farms have changed hands the past year. Land is constantly advancing in price, as Northern and Western men are looking for something to suit them. Market about as follows: wheat, 80 to 85 cents; corn, 40 cents; oats, 26 cents; rye, 56 cents; Irish potatoes, 50 to 55 cents; sweet, the same; apples none, except a few from the North. Timothy hay, $15; clover $10 per ton; pork, $6 per 100 pounds; turkeys, 10 to 11 cents, dressed; chickens, 8 to 9 cents; ducks, 9 cents per pound; coal, $6 per ton; wood, $3 per cord; horses, $30 to $150; cows, $20 to $60. S. T. S.

Illinois.

CHICAGO, Cook Co., December 15.—No rain and little snow so far, and so there is considerable scarcity of water over the Northwest; this extends to Kansas, Missouri, Iowa and to nearly every county in Illinois. Owing to the dry weather there is a falling off in the receipts of hogs for the last 10 days. In August and September an unusually large supply of hogs came to market owing to the terribly dry weather, the prospect of a short corn crop, and the ravages of hog cholera; this also accounts for the shortage of receipts of late. Hog raising has now become a very risky business, and those who have been the largest producers are now the very men who have the least nerve to go into it, after having experienced heavy losses. I think by the 1st of January the great bulk of the hog product of 1886 will have been marketed. Another reason for this is the fact that the scarcity of corn and its high price is a sufficient reason in itself to send in the hogs at once. The interstate demand for corn still continues good, and with an average freight of 20 cents per hundred in Nebraska to Chicago, the majority of dealers at present are paying higher prices for corn for local consumption than they can afford to pay and ship east. The indications now are that an unusual number of cattle will be fed in the stall this winter. Along the line of the Union Pacific road in Nebraska 150,000 head of cattle have been recently brought into the State from the mountains. The railroad company gave the privilege of feeding them for six months on corn, and it is estimated that from 8,000,000 to 10,000,000 bushels will be consumed by this bunch of cattle alone; and a very reliable correspondent from Lincoln, Nebraska, writes me that the home demand for corn is something unprecedented. Winter wheat has as yet encountered very little trying weather except from dry conditions. In the central portion of the winter wheat belt there is no snow upon the ground, but in the southern a light covering. There is no change to note in the spring wheat situation. The movements still continue quite fair, weather favorable to free deliveries. As farmers have sold very freely at a low price, they will be likely to hold now when they see wheat advancing. N. W.

Maryland.

WESTOVER, Somerset Co., December 11.—We had a splendid fall for doing work, and mild weather continued until December 3d, when a cold wave struck us, followed by snow and sleet to the depth of several inches. This cold spell came unusually early and found some farmers unprepared for it. There is still some corn in the fields, not husked. Most of the corn crop, however, is gathered and housed and it is exceptionally good. As a rule, we have no snow in this section until after Christmas, and one winter a few years ago no snow fell at all in our county. Those of our farmers who combine oyster planting with farming have since the freeze-up turned their attention to oyster shipping. S. C. S.

New York.

SANDY HILL, Washington Co., December 6.—Crops good and secured in good condition. Prices are as follows: Hay, $10 to $12.50 per ton; oat straw, $6 per ton; oats, 38 cents per bushel; corn, 60 cents; buckwheat, 65 cents; potatoes, 40 cents; apples, $1.50 per barrel; butter, 25 cents; eggs, 25 cents per dozen. M. T. W.

UTICA, Oneida Co., Dec. 15.—With the last Board of Trade closed the cheese market in this vicinity, and there has been no sale of any great amount during the past week. The factories which are not closed are making skims, which they will save for a month or more, and cure for the market. Prices are even with the quotations of the last Board, selling by the jobbers at from 12 to 13 cents for full cream. The Utica sales were for the year 325,962 boxes, or 19,557,720 pounds, at a value of $1,773,885, and ranged from 6¼ to 12¼ cents, as highest and lowest. This production was over 5,000 boxes greater than in 1885. The Little Falls production was 209,135 boxes at a valuation of $1,139,367; the two markets aggregating 2,903,252, which is a very creditable showing for the industry. The output of skims this month may not exceed 2,000 boxes. The market promises to be steady. The butter market is a little dull, but the same prices hold and will probably continue. Good butter is in fair demand, and 20 to 22 cents for dairy and 23 to 25 cents for creamery are paid in the country. About 175 packages were bought here last week. Good dairy still brings 23 and 24 cents here. There are few sales of hops reported. Some Otsegos have sold at 26½ cents, about 25 bales. The sale of 90 bales to a New York brewer a short time ago at 40 cents was considered quite a break in the monotony of the market, but they were A1 hops. No sales were made here this week; but a few in the vicinity at from 10 to 20 cents according to condition. R. I.

Pennsylvania.

ANDOVER, Alleghany Co.—We have nothing to complain of; for although the weather was very dry, still there were light showers enough to give us good fair crops all around. Oats a full average; not much wheat or corn is raised here. Buckwheat and barley crops fair. Potatoes about two-thirds of a crop, selling for 30 cents per bushel; butter from 20 to 22 cents per pound. This is mostly a dairy section. F. H.

THE FARMER'S CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

FEED FOR MILKING COW.

M. E. M., Maplewood, N. J.—My four-year-old Jersey cow doesn't give more than six quarts of milk a day. She will come in about June 1; what would be the best way to feed her for butter and milk for family use? A late RURAL tells how to feed a farrow cow in Winter; do cows giving milk require different treatment?

ANS.—The milking cow should be fed more liberally than a farrow cow, in proportion to the milk she is giving or expected to give. A common ration for a cow in milk and which is not to come in for six months is 15 pounds of hay of good quality and six or eight pounds of good mixed meal—one-half corn and one-half bran. The hay may be cut and wetted and mixed with the meal; five pounds of hay and four pounds of meal, morning and evening, and five pounds of long hay at noon. Water with the chill taken off should be given *ad libitum*, and a small handful of salt daily. It is quite possible that even better feeding than this might be given profitably. This is to be tested by gradually increasing the ration as long as the cow responds profitably to it. It is not so much the quantity of the milk given by a Jersey cow as the cream it contains which is the object of feeding. Some cows will give little milk but half of it is cream, and if more feed makes more butter, the feed may be increased until the maximum product is reached.

COAL ASHES WITHOUT POTASH AND PHOSPHORIC ACID.

E. P. M., Nichols, Conn.—As coal is formed of wood, what becomes of the potash and phosphoric acid that should be in the ashes after it has been burned?

ANS.—It is supposed that mineral coal is meant. Mineral coal is supposed to be the remains of a dense growth of mosses, ferns and soft wood plants and trees which have grown in swamps and have died and fallen until the mass has accumulated in beds of vast depth covered with water. It is well known that the potash and woody fiber are soon dissolved out from it, and this fact accounts for the poverty of swamp muck in these soluble mineral elements. Tanners' bark is rich in both these elements, but after it has been leached the ashes contain very little of them. Hence the exposure for thousands of years to the influence of water easily accounts for the absence of these elements in mineral coal.

FEED FOR PREGNANT COWS.

W. H. H. C., Brooklyn, N. Y.—Can new-process linseed meal be safely fed to a cow with calf? The general impression here is that it is liable to produce abortion.

ANS.—Abortion is caused by disease, accidental injury, worrying by the male, scanty diet, cold water drank in immoderate quantity, exposure to severe cold and it may be produced by poisons and probably by such foods as cause excessive purging or laxativeness. While cotton-seed meal, or even old-process oil meal contains such a large proportion of free oils that if either were fed in large quantity, it might produce scouring and by it weakness and possibly abortion, the new-process meal contains less free oil than corn meal, or even wheat or rye, and cannot on this account act upon the bowels injuriously. On the contrary, it contains a large amount of the flesh-forming elements as well as those needed for the bony structure of the calf, and a generous proportion should be included in the ration of every pregnant animal. Wheat bran is also a capital food for such animals.

SORE TEATS IN A COW.

J. T. Effingham, Ill.—For the last two years the teats of a young cow became blistered and she gets feverish. The sores run water and when the skin comes off they bleed. What should be done?

ANS.—Touch the sores with a stick of lunar caustic and apply an ointment of spermaceti and almond oil w tted together. The milk must be drawn very carefully and the teats kept dry. Twice daily give in the feed one ounce each powdered gertian and sodium bicarbonate. Continue several weeks if necessary.

UMBILICAL HERNIA IN A COLT.

S. A. B., North Blanford, Mass.—What should be the treatment for umbilical hernia in a colt, first noticed when it was about four months old?

ANS.—If the hernia is slight, apply a soft pad to the navel and retain in position by an *elastic* bandage around the body. This must be fastened to a collar and crupper so as to be kept in place, and the bandage must be elastic otherwise it is liable to prove injurious. A slight hernia is also frequently removed by repeatedly blistering the sac. If there is a considerable fold on the sac, place the colt on his back to return the viscera. Then apply clamps over the skin close to the belly, as in ordinary castration, and allow the colt to wear them until they drop off of their own accord. This should close the sac perfectly, and is really the most effectual method of treatment. The colt must be kept quiet where he cannot run or strain himself, until cured.

NAIL IN HORSE'S FOOT.

J. H. J., Troy, Pa.—One of my horses stepped on a 10-penny nail, and it ran into his forefoot just inside the shoe and broke off. With a pair of pinchers I pulled the nail out 2½ inches, and treated the foot in various ways; but it is still sore and tender, and the horse has been lying down about a month. He bites his sides, back-bone and hips, and sometimes he rubs his rump; pin-worms passed from him last spring; but I have noticed none of late. A year ago he had "scratches," and it was a hard job to cure him. What should be done for him?

ANS.—Make and keep a free opening where the nail entered the foot to allow free exit for the discharge. Wash out daily as long as the discharge continues, making sure to reach all parts of the diseased surface, with some astringent artisceptic solution, as one dram of sulphate of copper or one-half dram of chloride of zinc in a quart of water. Then dress with the best pine tar and apply a bandage to keep free from dirt. Follow the treatment given in the F. C. of Nov. 6 for "Worms in a Horse."

Miscellaneous

J. W. W., South Cameron, N. Y.—Is the Brazilian Flour Corn worth $1 a quart, and where can it be obtained?

ANS.—You can buy it of Samuel Wilson, Mechanicsvilles, Bucks Co., Pa., and, no doubt of others. The price should not be over four dollars the bushel. It will not *begin* to ripen with you and will prove therefore, a costly experiment. It may ripen in Southern Pennsylvania in favorable seasons. The R. N.-Y. of December 11 gives a full account of the trial of this corn made at the Rural Experiment Grounds last season.

J. H. C., La Conner, W. T., sends us a clip-

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria.

ping from the Seattle Weekly Press describing a potato on exhibition there, weighing nine pounds four ounces when dug, and asks whether we have ever seen such a tuber.

ANS.—If the potato is a perfect potato, then we have never seen or heard of one so large. By *perfect*, we mean a shapely potato—not a compound potato made up of a dozen smaller ones united. The RURAL has shown an illustration of a shapely potato weighing five pounds. This is about the largest we have ever seen.

W. M. D. H., Greenville, Vt. 1. Will it injure a mare or colt if the colt suckles a mare with foal? 2. Is Green's Nursery, Rochester, N. Y., trustworthy?

ANS.—1. The usual time for weaning the foal is about the end of six months, that time being selected because the dam is generally about "half gone" with the next foal, and cannot bear the double strain upon her system. Little or no harm is done to either foal or dam before that time, but if the foal sucks after that, the dam and fœtus both suffer, while the foal gets little benefit from the milk after that age, as the teeth and stomach are quite strong enough to eat and digest other food. 2. Yes; quite trustworthy.

G. W. M., Saltsburg, Pa.—Last season I grafted a Wild Goose Plum with a Green Gage. The graft grows too fast for the cion; is there any way of keeping it back? What will be the result?

ANS.—There is no way of preventing the difficulty referred to. The result will be to shorten the life of the tree, though it may live and bear many years. If the graft is near the surface of the ground, you might draw the earth up around the graft, and thus get the Green Gage on its own roots.

J. S. B., Fayetteville, N. C.—1. Is it possible that the Japan Chestnut can be successfully grafted upon Chinquapin roots? 2. How are Kieffer, Bietigheimer and Nelis Pears pronounced?

ANS.—We have no experience in grafting the Japan Chestnut on the roots of Chinquapin, but presume it can be done successfully. The only way to find out is to try it. Kieffer is pronounced Keefer; Bietigheimer, Beetighymer; Nelis Naylis. This is a French pear and the French pronunciation is Naylee.

W. L. B., Faulkner, Ind.—When does the peach tree borer lay its eggs?

ANS.—1. The moth appears in the Northern States and Canada from the middle of July to the end of August, and in the South it appears much earlier—in some places as early as the latter part of May. Shortly after its appearance the female—which is much larger than the male—begins to deposit her eggs singly in the bark of tree near the surface of the ground.

C. L. C., Poughkeepsie, N. Y.—What is a remedy for lice on a canary bird?

ANS.—If the cage is kept thoroughly clean and the seed given the bird is thoroughly sifted, it will never be troubled with vermin. A small bag made of book muslin filled with powdered sulphur and hung in the cage will soon clear the premises of the pests. Buhach is excellent.

H. W. C., Bradford Co., Pa.—Is it necessary to cover an Evergreen Blackberry that grew from 10 to 20 feet the past season? The vine came from the Pacific Slope.

ANS.—It would be well to cover it. This variety is not hardy at the Rural Grounds.

W. H. S. Woodlawn, Pa.—1. We cannot tell the standing of any of the mutual benefit societies of Illinois. There are a great many, and their standing is not given by any of the mercantile agencies. Apply for information to the State Insurance Superintendent, Springfield, Ill. 2. We do not believe in the "signs" as regulators of work—whether they are lunar or zodiacal.

J. L. S., Landisburg, Pa.—The Wooderson Spraying bellows are used at the Rural Grounds for the poultry house. They answer the purpose perfectly. A house 10x10 feet may be thoroughly sprayed in a minute or so. Lime wash is necessary unless kerosene in used in this way.

O. E. F., Humboldt, Ia.—Mr. Huaff claims to have discovered that the horns of mature animals can be cut off close to the head with comparatively little pain or loss of blood. His address is Atkinson, Ill.

E. P. N., Connecticut.—Have any of the subscribers the RURAL raised 200 bushel of potatoes on half an acre; not at that rate, but 200 bushel on an actual half, or 400 on a full acre. If so, I would like to hear how it was done.

Renewed Her Age Ten Years.

That life may be prolonged is the desire of every invalid, even with suffering, but this is not all Compound Oxygen does, as the letters of many patients testify. A Lawrence (Mass.) lady writes;

"My old troubles are all slowly leaving me. I have renewed my age ten years or more."

A farmer writes from Lockesburg, Ark.:

"I am feeling better and clearer of pain than for years. I can plow all day."

A lady writes from North Waterford, Me.:

"My mother, although 81 years old, feels as well as she did when 40 years old. She walks around the house spryly and does considerable work. She is living, she says, a new life."

If you think that you or any of your friends might be benefited by the use of this treatment, you can decide after an examination of a record of its work in a multitude of cases. A pamphlet of nearly two hundred pages will be mailed free to any applicant by Drs. STARKEY & PALEN, 1529 Arch street, Phil.—*adv.*

DISCUSSION.

SOUTH CAROLINA FLOATS AND CANADA PHOSPHATES.

J. S. W., LOCKPORT, N. Y.—I think the answer in F. C., page 771, to W. L., regarding Canadian phosphate entirely wrong inasmuch as it is said that "the South Carolina phosphate is a better material originally." It may be more easily soluble by the action of the soil, but certainly not for this reason. The floats do not contain, on an average, over (?) per cent. of phosphoric tricalcid, while the Canadian contains as much as 85 per cent. I would advise W. L. to procure some of the finest ground rock possible, and compost it with stable manure, by first putting a foot of manure over a space larger or smaller according to the quantity to be used. Over this scatter four inches of the ground rock, and on this spread six inches of manure and again more rock until the pile is made as high as desirable and contains all the phosphate he wishes to use, being careful to have a coat of manure on top. After lying a couple of months, fork it over thoroughly, mixing in a little fresh manure to again start fermentation, and again in two months repeat the forking. All this time the heap should be sufficiently moist so as not to burn, but not so moist as to stop fermentation. This heating and fermenting of the manure will act rapidly on the phosphate, and I have no doubt he will find great benefit from its use. These Canadian deposits are wonderful both in extent and richness, and some who have used the raw rock simply ground very fine report good results.

R. N.-Y.—The advice concerning experiments with Canada phosphate is excellent, and in accord with our frequent suggestion that such is the only way to learn whether this phosphate can be used in its raw condition with profit. But it cannot be denied that the experiment will be of little value unless the same crop is treated on another adjoining part of the same field with the stable manure alone carefully rotted in the same manner. It goes without saying that any manure so treated will of itself produce good crops; that it will produce any better crops with the phosphate added is contrary to the results of many careful experiments of a like nature, with phosphate of a similar character.

We are a trifle surprised that our esteemed friend should deny, if we understand him correctly, that "South Carolina phosphate" is a better material originally for direct use as a fertilizer because "it may be more easily soluble by the action of the soil." If it is not better for this reason, then one of the fundamental principles of agricultural chemistry must be abandoned. Concerning the comparative richness of South Carolina floats and Canada phosphate in phosphate of lime, we have few analytical data from impartial sources. In the last annual report of the New Jersey Experiment Station two analyses are given of the floats, one of them of a first-grade article showing 88 per cent. and the others of a second grade sample showing 57 per cent. We have not seen any Experiment Station analyses of the Canada phosphate. For aught that we know at present there may not be much difference in the average richness of the two kinds of phosphate.

G. F. T., POPLAR HILL, KAN.—In a recent statement, that was attributed to Professor Shelton, of this State, it is said that "in Kansas bumble-bees are almost unknown;" and in spite of their absence it was said that clover thrives excellently. Now, we have lived in Kansas eight years, and for the last four we have had clover, and I never saw so many or such large bumble-bees as there are here when the clover is in bloom.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, DECEMBER 25, 1886.

INDEX Number of the R. N.-Y.—the last of 1886.

NOTICE.

ALL subscribers who desire the RURAL's Seed Distribution must APPLY for it. Hitherto we have not required those who subscribe for the RURAL in connection with other papers to make an application. This has caused confusion. It is only necessary to say "SEND SEEDS."

THE Hon. Marshall Pinckney Wilder, the venerable President of the American Pomological Society, died suddenly at his home near Boston last Thursday afternoon in his 89th year. Few men were so honored and beloved in the community in which he lived, or so highly esteemed in the country at large; and there are few whose death will be so widely regretted.

MANY departments and all illustrations are omitted from this number to make space for the index, which will be found not to have been slighted in any way.

ONE of the most forcible sketches we have ever seen illustrative of the going out of the old year and the coming in of the new will appear on the first page of next week's R. N.-Y.

ANY of our readers who desire to order other journals in connection with the R. N.-Y. are referred to our clubbing list on page 777. Our subscription department is well equipped and we promise prompt and careful attention to all orders.

THE RURAL next week will be printed upon the heavy machine-calendered paper, and our readers will have the opportunity of comparing it with the super-calendered upon which the RURAL has been printed for several weeks past. We shall be pleased to learn which they prefer.

IT is probable that many of our new subscribers have not seen the RURAL NEW-YORKER'S Premium-list, account of its present Seed Distribution, posters, etc. All will be forwarded promptly to applicants. We are pleased at all times to send specimen copies as required, to all who desire to aid in enlarging the RURAL'S circulation for 1887.

OUR friend, Mr. J. S. Woodward, has begun to propagate one or the RURAL'S cross-bred wheats for distribution among our readers. It is quite a problem with us how to raise these wheats in sufficient quantity for this purpose since we have at least, counting the rye-wheat hybrids, over 50 well-marked varieties, with probably many more to come from later hybridizations. Mr. Woodward thinks the variety above referred to the most promising wheat he has ever raised.

THE series of articles by Joseph Harris, reviewing the experiments of Lawes and Gilbert will be complete in themselves; nevertheless, they will be progressive, and each one will have a certain dependence on the others, making it desirable that readers should study *every one*, if they would avail themselves of the full measure of instruction which this most valuable series may impart. The *regular* series will begin in the third number of the R. N.-Y. (Jan. 15.). The first article by Joseph Harris (*not* of the above series) will appear in our next number—the first of the New Year. It will tell why it has been necessary to use so much farm manure to produce maximum crops, and show how with less manure larger crops may be raised.

LANGSHANS.—It is never well to jump at conclusions. We sometimes think it is not well to chronicle things as they are or seem to be, for our statements are often copied by our contemporaries as positive, ultimate facts. The latest occurrence of this kind is what we said of our Worden Grape. We have now again to speak of our Langshan fowls, the latest of the many breeds tried at the Rural Grounds. But we speak of them as they *are*, not as they may be. Hatched out May 21st, they are now fully as large as Brahmas of the same age—fully as long and thick-legged and fully as long-necked. They are the *lightest* in weight of any fowls we have ever raised of their age and size. The pullets have not as yet layed, and we guess they will defer this business until next Spring. But they do excel any other fowls in brilliancy of plumage. We should think that it would pay to raise them for their feathers, which might be sold for ladies' hats instead of those of the song birds now slaughtered for that purpose. Thus far we should prefer either the Cochins or Brahmas to the Langshans either for eggs or meat.

"GEORGEISM."—The most noticeable thing we observed during a recent "discussion of the land theories of Henry George," was the evident inability of most of the speakers to understand what they were talking about. We notice this peculiarity in about all students of Henry George's works. Their vocabulary is largely increased, but not one in ten can state plainly and fairly, in a few words, what the new theory is and what its ultimate effects would be. "Georgeism" is the best name we have yet heard for the theory. Too much of it is still locked up in the ponderous brain of its author. However it may speak to the fair-minded and honest poor, and all who recognize the fact that there are defects in the present social system, it will always be enthusiastically indorsed by the lazy and the vicious. The idea of taking wealth away from one class and putting it into the hands of another will always find favor with those who dislike to work or dislike to save.

THE WASHINGTON SEED HUMBUG.—We are advised by several who are familiar with the inside doings of Government matters at Washington, not to oppose the seed business. "You will merely waste time and words," they say. "The seed business is popular among Congressmen and the tendency is not only to continue but to enlarge it. They view it as an easy method of showing consideration to farmers and of thus gaining popularity among them." Well, if popularity among farmers is to be purchased in this way, the best course for us to pursue is to smother our individual mortification thereat, and let the matter drop. But we do not believe it. There may be farmers who believe that the Washington seed distribution is maintained for their benefit, and who do not know that even though the best of seeds were sent out, they cost the country a hundred times more than they are worth. Such farmers, when undeceived, will, with the better-informed class, show their Congressmen that they had better take a rather different view of what will increase their popularity among their farmer constituents.

WITHIN the last twenty years the average annual production of grain to each inhabitant of this country has increased from 32½ to 52¼ bushels; while at the same time the cost of transportation from Chicago to New York has decreased from 3.45 cents to .68 of a cent per ton per mile. Thus the Western farmers, in spite of their distance from market, have been able to make a profit on their superabundant products, while Eastern consumers have been benefited to a remarkale extent by the cheapening of all staple articles of subsistence. Eastern farmers, however, can hardly look upon this condition of affairs as an unmixed blessing, as it brings the products of the cheap, virgin lands of the West into too close competition with those of the dear, partly exhausted farms of the East. Although the American laborer's food is better and more liberal than that of any other workingman on the globe, the average cost of it in the Eastern States is only 25 cents a day, and this is considered a fair estimate for the rest of the country also. When we consider that only 302,500 of our 3,500,000 square miles of land are used to raise food, there is no grave reason why the American people should fear starvation—in the near future at any rate.

FIGHTING CONTAGIOUS PLEURO-PNEUMONIA.—The bill now being prepared by Congressmen and representatives of the cattle growers' association for the eradication of contagious pleuro-pneumonia and similar diseases among cattle, provides for the appointment by the President of a Commission of three men of good executive ability, whose functions and pay are to be suspended by the President whenever the public safety will permit, and restored whenever he deems it necessary. They are to have ample powers to discover, quarantine, appraise, slaughter and pay for diseased and exposed cattle, and to establish needed rules and regulations which are to have the force of law when approved by the President. Penalties are imposed for obstructing the officers or concealing cases of the disease. They are to have the right to engage the best veterinary skill to be found, together with other needed assistants, and to make all necessary expenditures; for which an appropriation of $1,000,000 is asked. The provisions and machinery of the bill are reported to furnish simple and effective means, under proper legal safeguards, for promptly extirpating the plague which has already inflicted millions of dollars' worth of damage on the cattle interests of the country, and is now threatening still greater losses.

A RETROGRADE MOVEMENT.—The Milwaukee Chamber of Commerce protests against the publication of the monthly reports of the Department of Agriculture, on the ground that while they "subserve no useful purpose to the agricultural or commercial interests of the country," they "enable our foreign customers to establish values for our crops in advance of the harvest, often less than the outturn would warrant." The Chamber, therefore, urges that the Department of Agriculture should only "report on the acreage as soon as it is definitely ascertained, and on the yield of grain and cotton at the end of the calendar year."

This is a retrograde movement which should not be countenanced. A discontinuance of the official monthly reports would not prevent foreigners from obtaining a knowledge of the condition of our crops; while it would tend to increase the publication of untrustworthy statements made for the express purpose of influencing prices, against which the present monthly reports are a very salutary check. It is not so much the foreigner as the home speculator in options who takes advantage of all unfair influences to "establish values for our crops in advance of the harvest," and if the public should be deprived of the valuable service rendered to the legitimate industries of the country by these official monthly reports, the power of the speculator "to establish values" in an unfair manner would be vastly increased.

FOR 1887.

As we say to our readers "Happy New Year!" and "God bless you!" we would take the occasion to thank them for their support during the year and for the many kind expressions and words of appreciation and encouragement with which they have been pleased to favor us. Without making any specific promises for the new year, we shall endeavor to do the best that we know how. It is better that our readers should judge of the RURAL'S course in future by its past course. If we can not retain their support by what we have done, it is doubtful if any promises to do better will secure it. Our aim in the future, as it has been in the past, will be to aid our readers to produce larger crops at a less cost; to be more successful in their occupation, and, indeed, to add to the happiness of life, the love and appreciation of *home*. We have little respect for that sort of benevolence that is more ready to help a stranger than a needy member of one's own family. Benevolence should begin at home. And it may be doubted if there is any real happiness outside of home while the home is divided against itself. There is no other occupation on the face of the earth in which prosperity and love and harmony in the family circle are so closely dependent as in that of farming. And the farm paper in striving to do its highest duty should consider the one phase of farm life as well as the other.

Our friends are respectfully reminded that they may materially help the RURAL'S circulation and influence by sending another subscription with their own renewal, and that for those who are willing to act as agents either a cash commission or our liberally-scaled premium-list is available. We are always glad to send specimen copies, etc., as desired, to all who apply.

THE HATCH BILL.

STRENUOUS efforts are being made to push what is known as the "Hatch Bill" through Congress during the present session. The leading principle of the bill—that of appropriating money to be spent in experiments in agricultural science—cannot be too highly commended. We need experiment stations rightly conducted. This need is conceded by all thoughtful farmers. Does the "Hatch Bill" contain any absolute guarantee that the money it calls for will be spent for the purpose desired? Is it the strongest bill that could be presented? These are questions which may rightfully be asked, before commending the bill to our readers. The bill calls for an annual appriation of $720,000. The proposed stations are to be under the control of the various boards which control the expenditure of the money obtained from the sale of public lands for the purpose of establishing agricultural colleges. It may be well to ask how this money has been spent. Over $10,000,000 have been applied to agricultural education, nearly $5,000,000 worth of lands remain unsold, and the various States have appropriated, in round figures, $6,000,000 more. We believe that not over 30 per cent. of this vast sum has been applied as the original act designed it should be. Nearly $400,000 of the annual appropriation proposed by the "Hatch Bill" would go into the hands of the trustees of the State Universities—men who, as a rule, have little idea of the true needs of agriculture. We have, from time to time, urged upon Congress the necessity of investigating the condition of the various so-called agricultural colleges of the country. We believe that an investigation will prove that a large proportion of the money spent on agricultural education has been clearly misapplied. We cannot consistently recommend the advancement of more money until a satisfactory account of what has previously been spent shall be given. We believe that any system of experiment stations that is to be influenced by Washington politicians, will cost far more than it can be worth. We highly appreciate the energy and perseverance that have pushed this bill so far into public notice, but we believe a stronger and safer measure can be prepared that will more surely and more economically bring about the results we so much desire.

BREVITIES.

NEPAUL or Nepal Barley. Have any of our readers raised it? And, if so, how do they like it?

MANY readers, old and young, write to ask if the teacher in "The Story of a District School" was killed in his battle with Jack Brawn, and thus rendered incapable of continuing his diary. The Youth's Department has been crowded out for the past few weeks. The teacher is alive and well, however, and will pick up the thread of his story in good time.

THE Massachusetts Horticultural Society, which so generously offered the sum of $500 to be awarded in complimentary prizes at the next meeting of the American Pomological Society in Boston, will publish a list of these prizes that will be opened to the whole country. These, of course, are additional to the Wilder Medals that will be awarded for objects of special merit as heretofore. The time for the meeting of the A. P. Society will soon be decided on.

Mr. A. M. PURDY writes as that he has fruited the Concord and Worden Grapes side by side for 15 years and, while there is a marked similarity in the bunch, berry, vine and leaf, yet in one respect they greatly differ. The Worden colors fully a *week* to 10 *days* before the Concord and is good to eat as *soon* as it colors; while the Concord is *not* good for at least a week after coloring, thus making the Worden eatable at least two weeks before the Concord. The italics are Mr. Purdy's.

A WESTERN writer in planning the planting of an acre school lot suggests a roomy front—as a sort of reception ground and general play-field. Evergreen belts toward the back, inclose sheltered, sunny spaces for girls and for boys alone—the girls space having bays formed by projections from the belt for congenial groups to play in. Needful out-buildings are also screened by evergreens. There should be representatives of all our most valued trees, and in the front of the lines of belt many shrubs and hardy perennial flowers could very fitly have place.

THE Iowa Butter and Cheese Association passed a series of resolutions placing a "boycott" on all dealers who take out licenses for the sale of oleomargarine. There is a grim determination about these resolutions that speaks volumes. The secretary of the association is instructed to secure the names of all dealers who have taken out licenses. This "black list" will be available for all dairymen. If this action is enforced the sale of oleomargarine will be driven into the larger towns and cities of Iowa. Few country grocers could live under such a "boycott." The oleomargarine men are making a strong fight. Petitions for a reduction in the tax were yesterday presented by six Senators from various parts of the country. They were referred to the Committee on Agriculture. The friends of the dairy all over the country must stand firmly by their rights. The victory has been only half won. No effort should be spared to make the victory as complete as possible. The farmer who has the least hold upon his Representative, should exercise his influence at once. Congress must know that the farmers of this country are opposed to dishonest butter, and that they are thoroughly in earnest in their fight.

Miscellaneous.

TRANSCONTINENTAL LETTERS.—LXXII.

MARY WAGER-FISHER.

Sierra Madre Villa; "Lucky" Baldwin's ranch; Rose's winery; other "colonies" about Los Angeles; the San Bernardino country; Southern California for consumptives; California a bad country for a poor man; Riverside.

FROM Pasadena we made a *tournée* in a carriage for several miles through the adjacent country, which lay spread out as far as the eye could reach, like a garden. Our first halt was at the Sierra Madre Villa, which lies on the mountain side, just under the Sierra Madre Mountains, which are a part of the San Bernardino Range. This villa is a noted resort for invalids, and the outlook from its long, sunward piazzas is altogether enchanting. It is in the midst of oranges, figs, limes, almonds, loquats, palms, pepper trees and roses. In Pasadena I saw for the first time what I afterwards saw in profusion—the Japan or Chinese Umbrella-tree in bloom, blossoms resembling the Purple Lilac.

From the villa we drove through what is familiarly called "Lucky" Baldwin's ranch. There are 50,000 acres in this farm, magnificently irrigated with flowing water, and the whole of it beautiful as the Garden of Eden. Baldwin made a pile of money in speculation in San Francisco, and he has the reputation of being as despicable in moral character as he is rich in money. There are 600 acres in one vineyard on this ranch, we were told, and we rode for miles in an avenue bordered with palms and pepper trees—the latter a breezy, willowy tree. His country house here was a pretty novelty, not large, but æsthetic, painted white with "trimmings" of bright red. In an angle of a piazza was a great mirror, reaching from floor to ceiling, which, as you approached the house from the street, reflected and duplicated the beautiful grounds, producing a charming illusion.

Rose's Winery was another place which we included in the drive—a winery which produced one half million gallons of wine last year, of seven varieties. The buildings are of brick and very substantial in appearance. The vines in the vineyards hereabouts are not cut so low as in the Santa Rosa Valley, and as they were coming into leaf at that time, they presented a fine appearance. Rose is one of the thrifty, guzzling Germans who have contrived to "gobble up" so much of this fair land. Upon our return to Pasadena we passed the old mission church of San Gabriel, and the drive, all in all, was of exceptional charm.

For several miles along the road leading eastward from Los Angeles through the San Gabriel Valley there are other colony towns of great attractiveness, the spirit of emulation tending to the highest development, and indeed, from a money standpoint, I know of nothing more profitable than the tasteful ornamention of "real estate," for beauty has its value as well as utility, and the two readily harmonize if the beauty is genuine. One of these towns is called Pomona and another is Ontario. The genesis of these places seems to be the purchase of a large tract of land by a company or corporation who lay out upon it a town, cut the land up into lots, and see to it that their purchasers are first-class men—neither slovens nor laggards. They advertise its advantages and purposes, and often they lie roundly, too! As a rule, I do not think that the advertisements of Western lands by any party or parties concerned in them, can be relied upon in the smallest degree. The ease with which people lie in printers' ink is altogether remarkable.

During the first fifteen miles east of Los Angeles, we saw much uncultivated land and weeds in plenty. Roads in California are generally good, and along many of them eucalyptus trees have been planted. All the way to Colton, an important railway station, the road lies in full view of the glorious San Bernardino Mountains, an amethystical range still peaked with snow, and below, the smiling gardens.

From Colton we went up to San Bernardino for a day and a night, a distance of four miles by rail, but we returned by carriage. All of this country lying at the foot of the San Bernardino mountains is level and presents very much the same aspect, when the cultivation is similar. San Bernardino, as a health resort, claims to be more healthful than Los Angeles on account of its greater freedom from dampness and fogs. In all these Southern California towns the cough of the consumptive is heard, and the general verdict seems to be that the mountains, and the mountains alone, furnish the really beneficial air for ailing lungs. Where the atmosphere is exceedingly dry and pure, as in Arizona and some parts of Colorado, the stomach suffers for lack of good, fresh, appetizing, wholesome food, for sustenance drawn from the questionable resources of tin cans, is a poor thing. But all along the Pacific coast from the northern boundary of the United States to the southern, we found the food excellent and much cheaper than in the East. San Bernardinists claim that their oranges are far finer than those of Los Angeles, and that the soil and location are even superior to those at Riverside. The tendency is to small farms—one woman said that their place of 100 acres had dwindled to 30, and they now thought 10 quite enough.

It was considered well to protect the young orange groves from possible frosts, and we saw some under the temporary roofing erected for such purpose. Some trees were girdled with tar, as a protection from the scale bug. I thought San Bernardino an ill-kempt, little town—6,000 population—and far inferior in attractiveness to Pasadena. But the people said they were "going to fix up and beautify things" and attend to their drainage and muddy streets, the blessed season in which the rain falls not yet being over. The town is well shaded with cottonwod, pepper, cypress and eucalyptus. The fig grows well here. Oleander trees were in bloom, and Giant of Battle Roses were notable. Of course, there were some pretty cottages and good business blocks, while mud baths near the town and the mountain back of it with a great arrowhead print on it giving it its name, are things of unique interest. A good deal of barley used to be raised on the ranches, but now there is not much besides orchards and vineyards. On our ride back to Colton we drove through orchards of peach trees.

A groceryman at Colton with whom we talked in a saunter about the as yet uninteresting town, growled greatly about California and declared that it was no fit place for a poor man—that Washington and Oregon were far better! A good many invalids go into business and of course they haven't the push and energy of a live, healthy Yankee. Water, which is such an important element in this region, is obtained largely from artesian wells. The disconteuted grocer averred that people in California live off visitors and newcomers. Although we were in the great orange belt we found the oranges in the markets neither good nor cheap—the usual difficulty in getting "cologne at Cologne." From Colton we went a few miles southward by rail to Riverside, where the finest and choicest oranges are produced in Southern California and which, as a "colony" is a magnificent success for reasons which will follow in my next letter. The population is from three to four thousand, and it is the largest incorporated city in the United States—the incorporated area covering 52 square miles—and from eight to ten thousand acres are now in a state of high cultivation.

For Over Thirty Years

"*Brown's Bronchial Troches*" have been used, with unfailing success, for the relief and cure of Coughs, Hoarseness and other throat troubles. REV. HENRY WARD BEECHER says of them: "*I have never changed my mind respecting them from the first, except I think yet better of that which I began by thinking well of. I have also commended them to friends, and they have proved extremely serviceable. I do not hesitate to say that your Troches are pre-eminently the best.*"—*Adv.*
